The lecturer added that nearly every vegetable and cereal grown in England was also to be found cultivated in Tasmania, and even the thrush, blackbird, and nightingale were being introduced there. In the hop-growing districts near the banks of the Derwent, a very fine river, the plants were now mainly trained to wires and strings, instead of poles, and, although the initial cost was greater, the system proved economical in the end. High-class dairying was a great feature of the country, and also mining. The flora of some parts was most beautiful; the fern gullys, as shown on the screen, where groups of tree ferns grew close together, with others as undergrowth, to trees on the hill slopes were beautiful in the extreme. Many of the hard-wooded trees grew to a height of 250 to 300ft., and were used for piles; one of the latter, called the Tasmanian walking stick, 100ft. long, was brought to Dover.

Mr. Ely said there was a good opening for gardeners, mainly for single-handed places, and for groom-gardeners, and these were paid at the rate of 25s. to 30s. per week, with their keep, etc., in addition. Capable gardeners were paid higher wages still, the work being nearly all in the open air. But, said the lecturer, some gardeners failed because they refused to adapt themselves to the local conditions. If a man must succeed, he should lose some of his English notions; for their failures they only had themselves to blame.

Of fruit growing in Tasmania apples predominated, though pears did well, and were extensively grown, as well as the small bush fruits, such as raspberries, gooseberries, currants, and also strawberries. The export trade was about one million half-bushel cases, representing £400,000 annually, a very big industry. Land could be purchased at a cost of 6s. 8d. per acre, with payment extending over a period of fourteen years, or at 5s. per acre if paid for at once. The cost of clearing and making the ground fit for planting varied from £5 to £7; in some instances £10. The richest land was not found to be the best for apple culture

READ this work now. The result will be that your knowledge of the gardening craft will be greater than it ever was before, because you will gain the advice of 27 of the first horticultural experts of the day.

THOMPSON'S GARDENER'S ASSISTANT,

Edited by **W. WATSON, F.R.H.S.,** Curator of Kew Gardens.

To explain adequately what so large a work contains would require pages of THE GARDENERS' MAGAZINE. The following much abridged List will, however, give some small idea of the contents of the six large volumes: Meteorology—Plant Structure—Nutrition—Growth and Branching—Reproduction—Hybridisation—Classification—Insect and Other Plant Enemies—Plant Diseases—Soils—Manures—Tools and Instruments—Garden Structures—Heating—Propagation—Transplanting—Pruning—Flower Gardens—Ornamental Trees and Shrubs—Herbaceous Perennials—Aquatic and Bog Plants—Hardy and Half Hardy Annuals—Greenhouse and Conservatory—Stove and Tropical House—Orchids—Ferns—Palms and Cycads—Shrubs, Plants and Bulbs for Forcing—Retarding Plants—Spring, Summer, and Carpet Bedding—The Sub-tropical Garden—Orchards—Spraying Fruit Trees—Orchard Houses—Preserving, Packing, and Storing Fruits—Vegetables—Index (giving common and classic names). Thompson's Gardener's Assistant is the **cheapest** and most authoritative book dealing with **all** gardening.

——A COMPLETE GARDENING EDUCATION——

Hundreds of Illustrations in colour and black and white aid in explaining the text. Bound in two styles, cloth and half leather. The cloth edition costs 48s., the half leather (2 vols., Roxburgh library style), 50s. Low as the price undoubtedly is, it is not necessary to pay down the whole sum at once.

4/-

Send 4s. with your order, and we will send the work, bound in the style you prefer, carriage paid (post extra abroad), the balance of net price to be remitted by monthly sums of 4s.

as too much wood resulted; poor soil with a clayey subsoil was the best.

About one dozen varieties of apples were sufficient to grow for market purposes, and it was curious to note that many varieties were similar to those grown, and thought highly of, in England, such as Ribston Pippin, Alexander, New York Pippin, also Prince Albert, Sturmer Pippin, Stone Pippin, etc. A clear return of 2s. 6d. could be realised per bushel, or about £40 per acre. The lecturer advised anyone who intended to go out with a view to fruit culture to possess a small capital, and to work on a neighbour's fruit farm for a season at least before embarking on his own. The growers did not allow their trees to bear until they were about seven years old, and then they were very profitable, yielding from three hundred bushels in a bad season to over one thousand bushels in a good one, per acre. Small fruits were grown under the apple trees, pruning, and especially summer pruning, being freely done.

After the discussion which followed the lecture, a hearty vote of thanks was accorded Mr. Ely and the Victoria League.

Birmingham Gardeners' Association.

The annual convivial reunion of the members of the association occurred on Wednesday evening, February 16, at the Exchange Restaurant, Stephenson Place, when it was attended by upwards of seventy of the members and lady friends, and it proved to be one of the best events during the annals of the society. After partaking of an excellent tea, and sundry accompaniments, the guests were fully fortified to listen to vocal and musical entertainments, also to other amenities.

Mr. T. Humphreys occupied the chair, and in submitting the Royal toast in appropriate terms, naturally alluded to King Edward VII.'s innate love of and promotion of gardening, and the vast progress that had been made in horticulture during the last half-century. It was also gratifying to observe a material increase in the membership of the Birmingham Gardeners' Mutual Improvement Association, especially amongst the younger members of the horticultural fraternity.

The toast of "The Association" was proposed by Mr. Robert Sydenham, and Mr. Walter Jones responded in appropriate terms. The other speakers included Messrs. C. H. Herbert, Alfred Cryer, and W. L. Deedman.

National Vegetable Society.

A committee meeting of the above society was held at the Horticultural Hall on the 22nd inst., Mr. A. Dean, V.M.H., presiding. Messrs. G. Gordon, O. Thomas, E. Beckett, C. Foster, S. Mortimer, H. Markham, F. Harvey, G. Wythes (treasurer), and E. G. Quick (hon. secretary), being present. The Chairman read several letters, and referred to the schedules which had been sent to each member. The Treasurer presented a financial statement, and reported that there had been a considerable accession of new members since the last meeting, and that there were now over twenty vice-presidents. Several accounts were passed, and the Secretary reported upon various matters of interest. A sub-committee was appointed to view the trials of early cabbages, kindly undertaken by Mr. C. Foster, near Guildford. The Erdington Allotments Association, Birmingham, wished to be affiliated with the society, and the terms for affiliation of cottage gardening and allotment societies was fixed at 10s. yearly, and to ordinary horticultural societies, 20s. An interesting discussion took place regarding trials of vegetables this summer, and Mr. C. Foster kindly undertook a trial of first early potatoes, and dwarf early peas, the latter not to exceed 2ft. in height. New members were nominated and various business details dealt with.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

BLACK MOULD ON ORCHID LEAVES.—M. E., Jersey: The blackish markings are evidence of the presence of Cladosporium orchidearum, a fungus that apparently attacks only the decaying leaves, and is therefore not really harmful. Remove all decaying leaves, and also decaying portions of otherwise good leaves, and burn them. Cleanliness is one of the essentials of good orchid culture.

LEEKS.—J. B. W., Surbiton: For your purpose it will be quite early enough to begin by sowing seeds in shallow boxes in March, and placing the boxes in a temperature of about 60 deg. Gradually harden off the seedlings, and when they are about three inches high, or rather more, prick them out in a bed of rich soil in a sheltered position, placing them four inches apart. Early in June transplant into shallow trenches of deeply-worked and rich soil; plant deeply, using a dibber for the purpose. The usual method of watering, feeding, and blanching should be followed to secure the best results. Remember to sow the seeds thinly in the boxes.

WRITING ON ZINC LABELS.—S. W., Greenwich: Try bichloride of platinum for writing the names of trees upon the zinc labels.

POMPON DAHLIAS FOR GARDEN DECORATION.—S. O. H., Oxford: We have frequently drawn attention to the fact that nearly all the pompon dahlias, if allowed to grow freely, and planted in good but not very rich soil, produce abundance of blooms suitable alike for vases and garden decoration. Among the many varieties we may mention the following as especially useful for garden decoration: Crimson Gem, Dolly Keith, Edith Seale, Firefly, Harbinger, Ideal, Bugler, Norah, Ringdove, Snowflake, Spitfire, and The Duke. As soon as you can obtain your plants, probably at the end of April or early in May, pot them into five-inch pots, and grow them in a cold frame until at the end of May or early in June they may be planted out where they are to flower. This little extra trouble will be amply compensated for by finer plants, earlier flowering, and a longer season of usefulness.

GRAFTING WAX.—G. H. C., Malvern: A good old prescription for grafting wax, and one used in many nurseries is as follows: Melt 2lb. 12oz. of resin and 1lb. 11oz. of Burgundy pitch together in an iron pot; when melted and well mixed, add 9oz. of suet that has been melted separately and stir it in well. Follow this with 8oz. of red ochre, adding it little by little, and stirring well. The whole should be kept hot during the process of mixing, and should be used in a warm state, as it is then easily worked by means of a brush or rag.

FREESIAS.—F. H., Stamford: Remove the old flowering stems, and place the plants in a warm greenhouse on a shelf in a light position. Give liquid manure occasionally, and syringe the growths to keep them clean. When the foliage shows signs of turning yellow reduce the water supply gradually until when the growths die down no water is given at all. At this stage a high shelf in a greenhouse, where the sun can reach the pots and play upon them for most of the day, will suit the freesias admirably, for nothing is so conducive to free flowering as thorough ripening after a season of free growth

BLACK-STEMMED PELARGONIUMS.—S. E. C., Alderley: Some cultural error has weakened the plants, and rendered them open to an attack of the pelargonium stem rot, a fungus named Fusarium Pelargoni. The effect of an attack is, as you suggest, to stop the plants from growing, cause the lower leaves to turn yellow, and then the stems to turn black and go rotten. You may have noticed tiny whitish patches on the decayed portions of the stems; these are the conidia bursting through the skin of the diseased stem. The disease is apt to spread badly, therefore affected plants should be burnt, except in the case of those only slightly affected, which should have the diseased portions removed. Spray the rest of the stock with weak potassium sulphide solution, or weak Bordeaux mixture, to prevent the spread of the disease.

BERICHOANE MIXTURE. — C. L. S., Littlehampton: The Berichoane Mixture is, in effect, very like ammoniacal carbonate of copper. It is made by dissolving 6½lb. of sulphate of copper in four gallons of hot water, in one vessel; and 7½lb. of carbonate of soda in sufficient hot water in another vessel. When both are cold, mix the solutions, and add 1¾ pints of liquid ammonia. This amount is of sufficient strength for use when water is added to make up 44 gallons of mixture. It is a useful fungicide for moulds and mildews.

SCARLET SALVIAS.—A. G. L., Winchcombe: Take cuttings of the young growth during March, inserting them in sandy soil in a warm pit. Grow the young plants in a greenhouse or frame until about the middle of June, when they should be placed out of doors on a bed of ashes, and in an open position, there to remain until the end of August or beginning of September when they must be re-housed. Use a compost similar to that used for pelargoniums, and remember that 6in. pots are quite large enough to flower salvias in.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

C. H. R., Drayton. — 1, Calceolaria Burbidgei; 2, Pelargonium denticulatum.

T. C. C., Redcar.—1, Aglaonema costata; 2, Aralia Chabrieri; 3, Odontoglossum Andersonianum.

T. G., Amersham. — 1, Odontoglossum Wilckeanum; 2, Sophronitis grandiflora; 3, Cissus discolor.

M. P. F., Gomshall.—1, Veronica cupressoides; 2, Cotoneaster Simoni; 3, Sparmannia africana; 4, Acacia armata.

H. S. E., Chichester. — 1, Pelargonium Clorinda; 2, Begonia Haageana; 3, B. maculata; 4, Francisea calycina; 5, Iris stylosa.

TRADE NOTE.

As an evidence of the progress which China is making as regards Western methods, it is interesting to note that the Chinese Minister in London has recently been instructed by his Government to forward a consignment of English seeds to be sown in the Province of Sze'chuan, where until recently opium was grown on a large scale. His Excellency, after several interviews with Messrs. John K. King and Sons, The King's Seedsmen, Coggeshall, gave that firm an order to despatch a quantity of such kinds of seeds as they consider suitable for the climate of China, and eight large cases of the most approved kinds of farm and garden seeds are being dispatched this month to Shanghai for forwarding to Sze'chuan

ACTION AND MOVEMENTS OF WATER IN SOIL.

(Continued from page 132.)

◆

Rise of Water in Different Soils.

To study, the rate at which water will rise in soils of different kinds, four glass tubes three feet six inches long and three-fourths of an inch inside diameter were supported in a vertical position by a stand constructed for the purpose. The lower ends of the tubes rested in a zinc pan, in which water was kept at nearly constant depth. The samples of soil were retained in the tubes by stopping the lower ends with perforated rubber stoppers, over which were placed pieces of linen. The linen prevented the passage of the soil through the perforation in the stopper, while it permitted the free access of water.

All the soils were steam dried and sifted through a sieve containing 400 meshes to the square inch. The progress of the water upward by capillary attraction, as indicated by a change in colour, was noted daily from December 27, the date at which the experiment was started, to February 29.

An examination of the results was sufficient to impress one with the fact that when a soil is allowed to become dry, the rate at which it will lift water is then very slow, and it is because of this fact that surface tillage, which develops a dry layer at the surface of a field is so effective in checking the loss of water by evaporation. It was seen that with dry soil standing directly in water, the time required to raise water through three feet of soil varied from three days, in the case of sand, to over three months, in the case of a heavy clay soil.

In this connection it is important to remember that cultivating breaks the capillary connection between the surface and subsoil, then if a dry season should follow the evaporation from the surface is very rapid, and before capillary connection can be re-established, the surface soil will have lost much of the water it contained. This may mean the failure of crops on clayey land, which has been spring-worked. Too much emphasis cannot therefore be placed upon this point in connection with the cultivation of clay lands. The cultivation of such soils before seeding should be deep, and thorough. All clods should be broken down, and the particles of soil made as fine as possible. The finer the soil is made, the more food there is available, and the more moisture there is retained. The seed beds should be deep, clean, and moist, for the proper germination and growth of plants.

These very important facts may explain in a large measure the apparently paradoxical experience of crops suffering more from drought during dry seasons on undrained, than do those on drained land. When the subsoil is overcharged with moisture, the roots of the plants do not penetrate deeply into it, and the result is a large development of roots, and overcrowding near the surface. So when the plants become large and the demand for water is great, capillary attraction is unable to lift water from below as rapidly as it is used. Thus the soil towards the surface becomes too dry, and the crop suffers greatly from want of water when there is an abundance of it only a short distance below the surface.

On the other hand, a well-drained subsoil permits the roots to penetrate deeply at the outset, and thus overcrowding is avoided. The roots, in this way, come in contact with a large volume of soil, and do not draw the water so rapidly from any one portion. This allows capillary action to hold the soil up to a degree of moisture at which the rate of the movement is rapid, and the crop is thus better supplied by utilising water stored up more deeply in the ground. But this is not all. The surface roots, having been freed from the urgent need of gathering water, leave the surface soil more moist, and this allows the nitrifying process to go forward, which alone can furnish the plants with nitrogen. The keeping of the surface six inches at a proper degree of moisture is thus seen to be of the utmost importance, for it is within this zone that most of the nitrogen is elaborated.

(To be continued.)

THOMSON'S CELEBRATED MANURES.
For full advertisement see page ix.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

VOL. LIII.—No. 2,940. SATURDAY, MARCH 5, 1910.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Adaptation of the Plant to the Soil.

Few questions are of greater importance to horticulturists than the adaptation of the plant to the soil, and the means by which certain soils can be so ameliorated as to be rendered suitable for plants that in the ordinary course grow the most satisfactorily in soils differing in the nature of the constituents available as plant food. Hence it was not surprising the large lecture room at the Horticultural Hall should have been crowded on the 22nd ult., when Mr. A. D. Hall, F.R.S., gave the first of his two lectures on the subject stated at the head of this note. Nor was it surprising the lecture should have received the closest attention throughout, for Mr. Hall is an accomplished speaker, and has the courage of his convictions. If we were unable to accept without considerable reserve the conclusions at which Mr. Hall had arrived as the result of his study of the subject, we, in common with other members of the audience, fully enjoyed the clearness with which he described the results that have been obtained at Rothamstead during the past sixty years in the experimental manuring of grass land, and his views generally on the subject he was discussing. Mr. Hall had not proceeded far with his lecture before he quickened the interest of his audience by speaking of the fallacies in horticultural literature, and of the misapprehensions which exist among cultivators with regard to the possibilities of adapting soils to the requirements of certain classes of plants by adding to them such food constituents as they appear from the analysis of the plants to be deficient in. The evidence submitted in support of these suggestions was so far from being conclusive as to require careful examination. Mr. Hall, in passing under review the more important of the results of the experiments conducted with a view to ascertain the effects of the different kinds of manures on grass land, first directed attention to the plot which for sixty years has not received any manure whatever. In this plot the growth of the herbage was dwarf and uniform, and grasses predominated, and of the latter Fescue ovina was the most plentiful. In the plots which had received applications of mineral manures only, leguminous plants were the most numerous, and made a relatively much stronger growth than did the grasses which had been able to retain their position in the plots. The superiority of the growth of leguminous plants in these plots was, as Mr. Hall pointed out, due to their being able to obtain the requisite supplies of nitrogen through the agency of the nodule-forming bacteria. As the result of the use of ammonia salts alone, a large proportion of the leguminous plants and the finer grasses disappeared, and such poor grasses as Agrostis vulgaris and Festuca ovina obtained prominence; but by the use of nitrate of soda alone, the percentage of grasses was largely increased. The herbage generally differed in the two plots to which nitrogenous manures had been applied, this difference being due to the fact that while nitrate of soda was quickly washed down into the soil sulphate of ammonia diffused slowly. In consequence thereof the nitrate of soda greatly promoted the growth of deep rooting plants, and the sulphate of ammonia favoured those which are shallow rooting. A combination of nitrogenous and mineral manures had promoted the development of the grasses, especially the finer kinds, and resulted in a much stronger growth of the greater proportion, if not all of the plants forming the herbage. Mr. Hall then proceeded to refer to the fact that the great difference in the vegetation that had been brought about by artificial means, might suggest that it would be comparatively easy to prepare a soil suited to the requirements of a certain plant from analyses of the plant and the soil in which it had been known to thrive. This, however, was not the case. All plants contained the same elementary constituents taken from the soil and in much the same proportions; he had indeed found that there was as much difference in the same kinds grown in different soils as between plants of distinct kinds. Mr. Hall also stated that soils of widely different characteristics were very closely allied in the matter of chemical composition. Therefore, when a plant was found to succeed in one garden and to fail in another not far distant, it was a fallacy to assume as had been frequently done that success could be achieved in the second garden by an amelioration of the soil in accordance with information derived from analyses of the plant and the soil of the garden in which it succeeded. In an endeavour to reconcile these facts with the great difference that had been effected in the character of the herbage of the experimental plots at Rothamstead by the use of manures, Mr. Hall expressed the opinion that it was necessary to take into consideration the in-intense competition between the several species. It may be that so close a relationship has not been established between the analysis of a soil and the plants thriving therein as could be wished. Yet it is sufficiently close to be turned to good account by cultivators who appreciate the importance of taking into consideration all the factors bearing on the point, as, for example, the physical condition of the soil and the aspect of the site. In some cases there is a considerable difference in the chemical composition of soils in neighbouring gardens, but failures such as Mr. Hall referred to are frequently due to the plants not having the little shelter or shade which they need, or sufficient moisture, owing to

MR. H. J. CHAPMAN.

their being in a position where the full amount of rainfall cannot reach them. So far as the composition of soils generally is concerned, there is assuredly a great difference in the constituents of soils overlaying limestone and chalk, and peat; and in light sands and heavy clays. Again, the authoritative analyses of plants show that the difference in the constituents is sufficiently well marked to fully explain why these plants do much better on some soils than in others when the physical condition of the soil and the climatic conditions are practically the same.

Mr. H. J. Chapman.—It gives us great pleasure to publish in the present issue a portrait of our friend and helper, Mr. H. J. Chapman, who is famous as one of the foremost exponents of the art of orchid culture. A Devonshire man, whose life has been devoted to horticulture, Mr. Chapman spent the earlier years of his career in various establishments, seeking and gaining experience in various branches of his chosen profession. He served at such well-known establishments as Perksfield; Downside, Leatherhead; Messrs. J. Veitch and Sons, Chelsea; and Sandringham. During these years his interest in orchids and orchid culture grew steadily, and when the opportunity came, he was well able to take charge of the orchids brought together at Cambridge Lodge, Camberwell, by the late Mr. R. H. Measures. Under Mr. Chapman's care, the collection increased in extent and value, for he became a daring propagator of these aristocratic plants, and a raiser of new hybrids. Subsequently Mr. Chapman became head gardener to the late Mr. Norman C. Cookson at Oakwood, Wylam-on-Tyne, and again a splendid collection of orchids came under his care, and opportunities for raising new and fine orchids were increased, because of the superior varieties and hybrids in the collection. Probably no other collection is so rich in superb varieties of odontoglossums. Mr. Chapman has raised many fine cypripediums, odontoglossums, odontiodas, etc., and is continuing the work at Oakwood, as Mrs. N. C. Cookson has not, happily, broken up the collection formed by her husband, but, with her son, Mr. Clive Cookson, continues to take an active interest in it. We need not detail Mr. Chapman's successes, as so many of them have been illustrated in these pages. Gold and other medals and many certificates and cultural commendations from the Royal Horticultural Society have been won by Mr. Chapman, and a few weeks ago he was presented with the Veitch Memorial Medal in recognition of his work among orchids. For a long number of years Mr. Chapman has been a member of the R.H.S. Orchid Committee, and we may add in conclusion that it was at our suggestion and in these columns that Mr. Chapman commenced to teach orchid culture through the medium of his pen.

Flowers at Kew.—Just now, if you are fortunate to select a bright day, a visit to Kew is most enjoyable. Everywhere there are signs of spring, from the song of the birds and the thickening buds of flowering shrubs to the sound of the mowing machine. Flowers are appearing fast; the snowdrops and the Christmas roses are passing, but the scillas and the chionodoxas are delightful, and each day brings out more and more crocuses. In the Alpine House the irises, saxifragas, crocuses, tulips, and hardy cyclamens provide a feast of beauty, while in the large No. 4 house there is a brilliant display of azaleas, heaths, primulas, begonias, camellias, tulips, Iris reticulata, lachenalias, forced spiræas, cyclamens, and many other good things, either beautiful or fragrant, or both.

Great Flower Show at Haarlem.—The first of the series of bulb exhibitions to be held this year in Haarlem in celebration of the jubilee of the Dutch Bulb Growers' Society will be opened on March 23 by Prince Henry of the Netherlands, and the Dutch Minister of Agriculture will be the orator of the day. Although an additional building has been erected, the exhibition halls are not large enough for the amount of space applied for by exhibitors, so keen does the competition promise to be. The permanent exhibition consists of about a million bulbs planted in beds, groups, etc., and arranged to produce a continuous display from crocus time to the end of the tulip season. Those who are taking part in the proceedings as judges, etc., at the opening exhibition, will be well advised if they proceed to Harwich on Sunday evening, March 20, in time to catch the Great Eastern Railway Company's night boat to the Hook of Holland. By this means they will be able to reach Haarlem in time for breakfast on Monday, take a preliminary view of the permanent and special exhibitions, and be ready for the meeting of judges, officials, press, etc., that evening. Judging will be done on Tuesday, so that everything will be ready for the grand opening ceremony on the Wednesday. Horticulturists who have but little time to spare may by means of the splendid service of the Great Eastern Railway Company between Liverpool Street and Haarlem, viâ the Hook of Holland, visit the exhibition at a relatively small cost, and spend a day therein, without being away from business more than one day, the journey each way being made with comfort during the night.

Torquay Gardens.—In the issues of the Gardeners' Magazine for March 19 and 26, we shall give an illustrated account of the more noteworthy gardens in and around Torquay. These will include, in addition to the public gardens, those of Cockington Court, Eltham, Greenway, Lupton House, Normount, Pilmuir, Roby Hall, Walton Lodge, and Torre Abbey.

Beautiful Chrysanthemums.—On the occasion of the chrysanthemum show held at Hamburg last autumn, the visitors were invited to record their votes for the most beautiful varieties exhibited. The results, which have been recently published, were, as regards the three obtaining the greatest number of votes: Mme. Gustave Rivol, 1,920 votes; Mme. Paolo Radaelli, 1,246 votes; and Miss G. Paget, 1,002 votes.

Japanese Horticulture at Shepherd's Bush.—Among the many interesting horticultural features that are to appear at the forthcoming Japan-British exhibition, will be a miniature garden sent by the City of Tokio. This is designed by the renowned Taikoyen in Shiba Park, and will be no more than twelve feet long by seven feet broad. Here are to be diminutive old trees, houses exactly modelled on the smallest scale, ponds and rocks in closest miniature. Such perfect care and minute attention is bestowed on this work of art that the very trees and shrubs are to be changed with the changing seasons. Thus the pink of the cherry blossom will in due course be followed by the lovely white and purple of the graceful wistaria. Naturally the cost of these models will be very great. In addition to this and other of the horticultural attractions on a small scale, a large section of the exhibition grounds is to be arranged in two large gardens after the style prevalent among the highest class of the Nippon gardeners. The first of the areas to be so treated will extend over some 100,000 sq. ft., while the second is to cover an almost equally large space. Large trees, bridges, and houses, quite complete, and the very rocks to be used for laying out the gardens, are being sent from the Island Empire of the Far East, so as to reproduce a true and typical effect. When visitors regard the final result of all this care, the public will have further evidence of the fact that, if "genius is the art of taking pains," it is amply possessed by Japan.

Royal Horticultural Society's Bulb Show. — The society's annual spring bulb show, which has proved in the past so great a success, is to be held on Tuesday and Wednesday, March 8 and 9 next. The Council decided to continue the exhibition this year for two days because of its evident popularity last year, and the crowded attendance which then resulted from a one-day show. Besides the usual displays, there will be competitive classes for forced hyacinths, bulbs grown in fibre (hyacinths, tulips, narcissi), and amaryllis.

Spring Flowers at Leonardslee.—Writing a few days since, Mr. W. A. Cook observes: Spring flowers are becoming plentiful, and giving a bright display of colouring in some of the more favoured spots. We have had a goodly number of plants in bloom for some time past, and at the middle of February primroses, aconites, hepaticas, Galanthus Elwesi, Crocus Sieberi, and Iris stylosa were plentiful, the last mentioned of the several subjects being particularly good.

Royal Botanic Society.—At the meeting of Fellows held on the 27th ult., thirty-five new Fellows and seven new members were elected, and fifty-four others were nominated for ballot at the next meeting. The number of Fellows elected and proposed exceeded that at any previous meeting of the society.

An Exhibition of Crocuses was held at Plaistow on Saturday, the 27th ult., and was of much interest as evidence of what can be accomplished in the cultivation of bulbs in towns. The exhibition was held in connection with the St. Mary's Guild, Poplar, and consisted of about 2,500 bulbs, these being the best of the 6,000 bulbs that were given to the children of the parish in November last.

A Sunny Winter.—Notwithstanding the fact that there were but few days in February on which rain did not fall at Westminster, the total duration of bright sunshine amounted to 53.9, and exceeded the average by 20 hours. The total was rather higher in February, 1909, but there are only two years in which it was considerably higher than last month. In 1894 there were eight hours, and in 1906 seven hours more. In December and January last the amount of bright sunshine recorded at Westminster was very high. The aggregate for the three months ended February 28 was 118 hours above the average.

The B.G.A. and Horticultural Examinations.—The members of the London Branch of the British Gardeners' Association have again distinguished themselves in the examination for parks employees, held by the Royal Horticultural Society. The examination was held on January 10, when six members secured first-class certificates, and the silver medal was won by Mr. P. G. Butcher. Thirty-two members of this branch have now obtained the first-class certificate in this examination, while three silver and two gold medallists are also included.

GREENHOUSES FOR PERPETUAL CARNATIONS.

The best style of greenhouse for the amateur or private grower of perpetual carnations is a subject on which, naturally, there is some diversity of opinion. Certain local conditions also have to be taken into account. For instance, the site may be level, or it may be on a hillside, the climate may be warm or it may be cold, the house may be open to strong winds or heavy falls of snow. All of these things, and many others, have to be taken into consideration when building a greenhouse.

For this reason it is not possible for anyone to design any particular style of greenhouse and call it a model carnation house. Yet there are certain essentials which we nearly all agree upon, such as winter light, air, heat, etc.

The aspect of the house in this country, where our winters are so dull, is a most important matter. If the greenhouse is built from east to west, you get more light when light is at a premium, and that is the most important point to be considered for any winter-flowering plant. In a house built with the ridge running north to south the sun's rays, when low in the winter, instead of striking the glass at right angles, strike it at such an angle that much of the light, instead of passing through the glass, is deflected, and lost to the plants inside.

Then, too, the woodwork in the roof of such a house will cast more shade than is the case in an east to west house. That is why no one should build, for choice, a house running from north to south for perpetual carnations.

The matter of size of the house is, of course, influenced by requirements, but a lofty house is greatly to be preferred, and if the roof is glazed with the largest-sized glass, it is an advantage. It is better for perpetual carnations to be a good distance from the glass, particularly if the light is very good. The larger the body of air contained in a greenhouse the more easily it is kept at an even temperature in the winter.

The ventilation must be adequate to cope with the hot sun of March, and also the late summer weather we so often have in September. Continuous ventilation on each side of the ridge is best, allowing for a maximum amount of fresh air with a minimum amount of draught. I strongly believe that all specially-built carnation houses should have at least four-feet glass sides made to open as ventilators, also box ventilators made in the brickwork just above the ground level, so as to admit fresh air beneath the stages for use in cold weather. A house so provided with means of ventilation can never be out of control in the matter of temperature, which we know is often a difficult problem in a month like March, when some days we have to contend with a burning sun and a biting wind.

The actual amount of hot-water piping required for any one greenhouse must be decided individually, but this point should be borne most strongly in mind, that we can only imitate Nature when we have an abundance of piping mildly heated, which will give off a gentle warmth. Compare this with a greenhouse which has insufficient piping, and in which, during a cold spell, the fires are rushed. The few pipes give off a great heat, which, in turn, completely dries up the air, and is favourable to several insect pests.

The change of ideas is only in keeping with our times, and there is no doubt that the flow-pipe running along the eave plate or on the roof of a greenhouse is better than putting pipes near the ground, where the dry heat comes into direct contact with the plants.

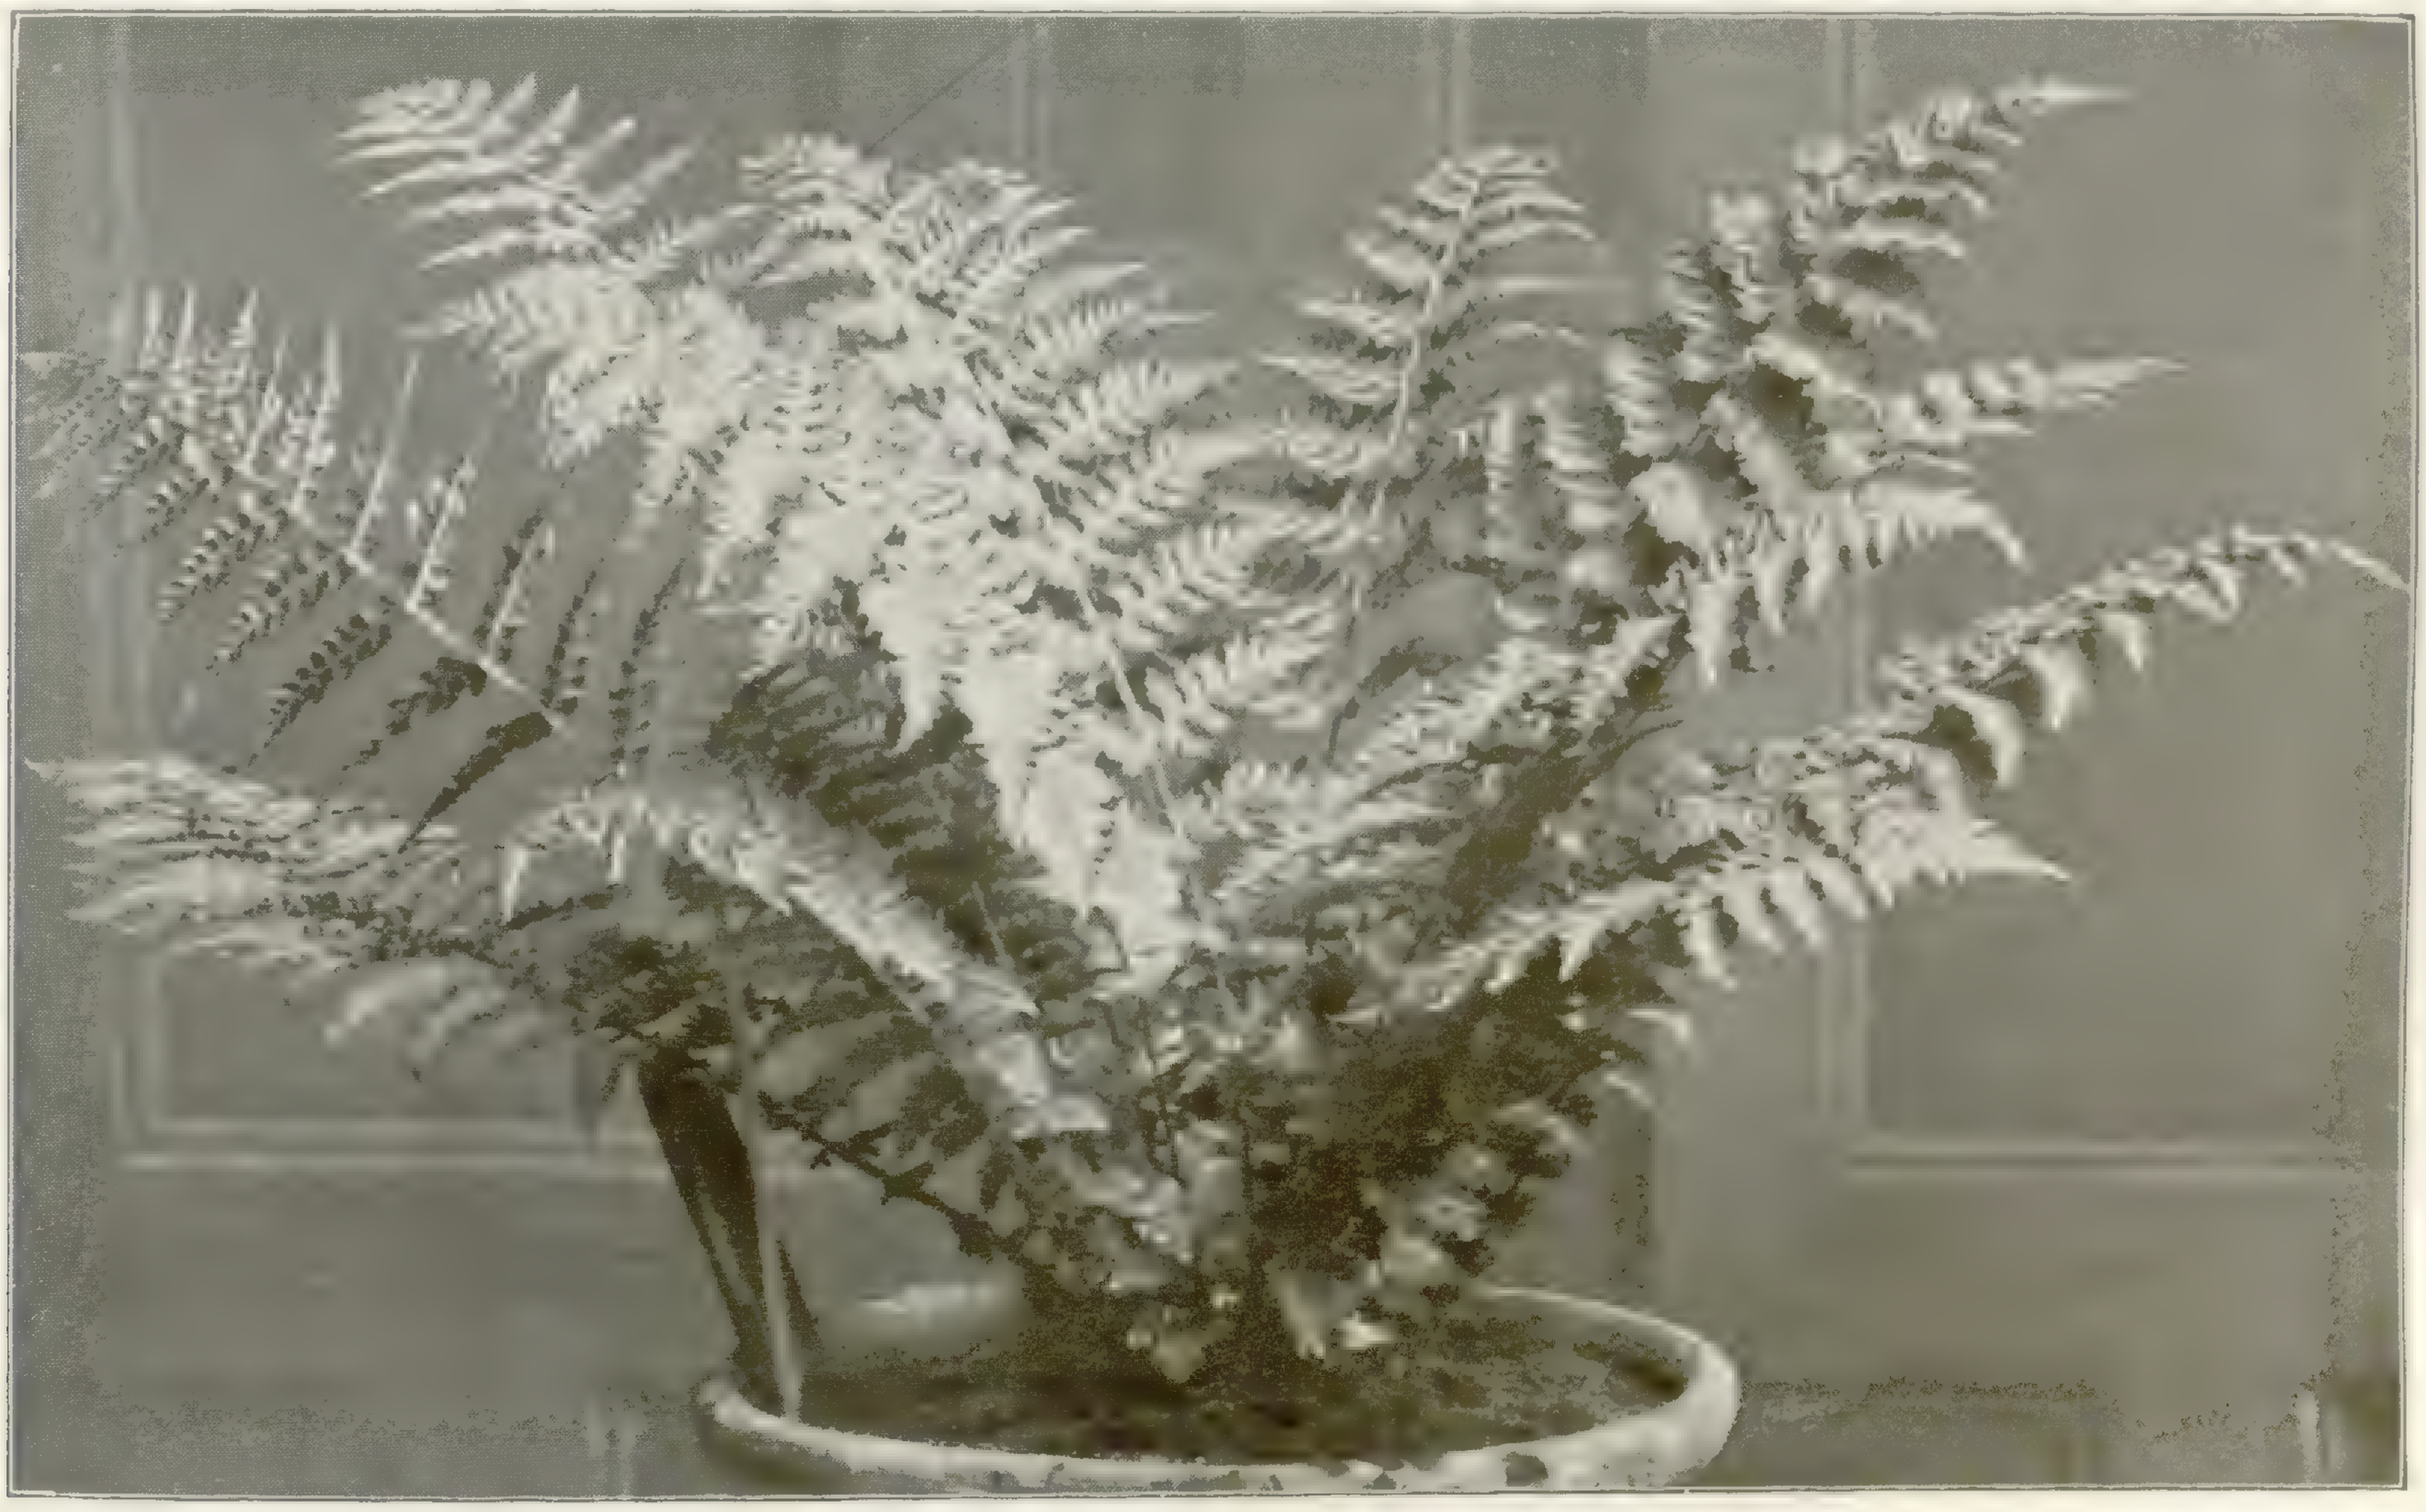
These are the most important points which one has to study when building a greenhouse for perpetual carnations.

Montagu C. Allwood.

"CARNATIONS, PICOTEES, AND PINKS," will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

LASTREA MONTANA PLUMOSA STANSFIELD.

This very beautiful fern, an illustration of which is reproduced from the "British Fern Gazette," was found by Dr. F. W. Stansfield, in July of last year, near Nevin, Carnarvonshire, and although a comparatively small specimen, displays the plumose character far more than any previous find, and promises to become an easy first amongst the many beautiful forms of this species. Curiously enough, in the early days of fern hunting L. montana acquired the reputation of being an extremely constant species, little liable to variation, but, later on, Mr. Barnes, of Milnthorpe, in the Lake District, found a beautifully tasselled form, and, encouraged by this, he and others eventually demonstrated its variability to such an extent that something like seventy distinct varieties have been found wild, and added to collections.



LASTREA MONTANA PLUMOSA STANSFIELD.

Of the plumose type, characterised by breadth of pinnæ and incised sub-divisions, adding much to delicacy and beauty, Mr. Barnes, Mr. Whitwell, and the writer have found well-marked examples, and it is a matter of congratulation that Dr. Stansfield should have been fortunate enough, not merely to add a fourth, but presumably to eclipse all the preceding discoveries. Amongst the most remarkable forms so far discovered L. m. Barnesi is the most striking. In this the fronds are very erect and narrow, the side divisions being short; its main peculiarity, however, is that these divisions are not set on in the plane of the frond, but at right angles to it, like the steps of a ladder, and it is recorded that when Mr. Barnes came across it, full size, and alone, on one of the Lakeland hillsides, it quite took his breath away, as apparently it belonged to some new and unknow species, and it was some time before he recovered sufficiently to effect its removal. Dr. Stansfield's feelings were doubtless akin to this on catching sight of his latest acquisition.

C. T. Druery.

HISTORICAL NOTES ON THE LEEK.

The editor of the second edition of "Hortus Kewensis," which was published in 1811, states that the leek (Allium ampeloprasum var Porrum) is a native of Switzerland, and gives the authority of Turner's "Herbal" that it was introduced to cultivation in 1562, and on both points he was unquestionably wrong. That he should have erred in assigning the leek a place in the Swiss flora is not surprising, for with the limited amount of information then available, it must have been extremely difficult to check statements as to the place of origin of many plants, and at the present time no one can authoritatively state whence this useful vegetable had its origin. With regard to the date when it was introduced to cultivation, it is quite certain that it was grown in English gardens long previous to the year mentioned. It may be that Aiton simply gave the year 1562 as that in which the fact of it being in cultivation was first published. We have proof that it was in cultivation long previous to the middle of the sixteenth century, for Gerard states in his "Herball," published in 1597: "It is common everywhere in other countries, as well as in England." We have evidence that he was well acquainted with the leek when his herbal was written, for with regard to its cultivation he suggests that "it requireth a mean earth, fat, well-dunged, and digged."

Tusser, whose "Five Hundred Points of Good Husbandry" was published previous to Gerard's "Herball," suggests in his classic that the vegetable was in general cultivation in his time. Dealing with the work for the month of March, he writes:

> "Now leeks are in season, for pottage full good,
> And spareth the milch cow, and purgeth the blood;
> These having with peason, for pottage in Lent,
> Thou spareth both oatmeal and bread to be spent."

Another fact of interest is that showing that not only were leeks largely grown thus early, but also that they were regarded as very hardy in constitution. In an account of the Great Frost of 1608 the writer observes: "The leek, whose courage hath ever been so undaunted that he hath borne up his lusty head in all storms, and could never be compelled to shrink for hail, snow, frost, or showers, is now by the violence and cruelty of the weather beaten into the earth, being rotted, dead, disgraced, and trod upon."

If we turn to Wales for evidence of the long period that the leek has been known in the United Kingdom we shall be able to trace it back between 1,400 and 1,500 years, assuming no mistake has arisen with regard to the plant selected by the Patron Saint of the Principality. According to a tradition that is now well known, leeks were worn by the Welshmen in a battle between them and the Saxons to distinguish themselves from the enemy. Proving victorious the troops were commanded by St. David to wear a leek upon the anniversary of his death.

There is no difficulty, as will have been seen, in showing that the leek was cultivated in this country long anterior to the middle of the sixteenth century, but it is practically impossible to say where and when it originated. In the monograph by J. Gay (Ann. des Sc. Nat., 3rd series, Vol. VIII.), it is suggested that it is simply a cultivated variety of Allium ampeloprasum, as was supposed to be the case both by Linnæus and De Candolle. According to De Candolle's "Origin of Plants," the "cultivated variety of Porrum has not been found wild. It is only mentioned in doubtful localities, such as vineyards, gardens, etc." From this publication we learn also that the leek is "common in the East and the Mediterranean region, especially in Algeria," and that "in Central Europe it sometimes becomes naturalised in vineyards and round ancient cultivations." The specimens of the original type of the cultivated leek herewith illustrated were grown by Messrs. Sutton and Sons from seed sent them by Miss Jekyll, who had received it from abroad, possibly Southern Europe. The reproductions of this and Sutton's Improved Musselburgh are on nearly the same scale, and the illustrations are of much interest as showing the immense improvement that has been effected by persistent selection.

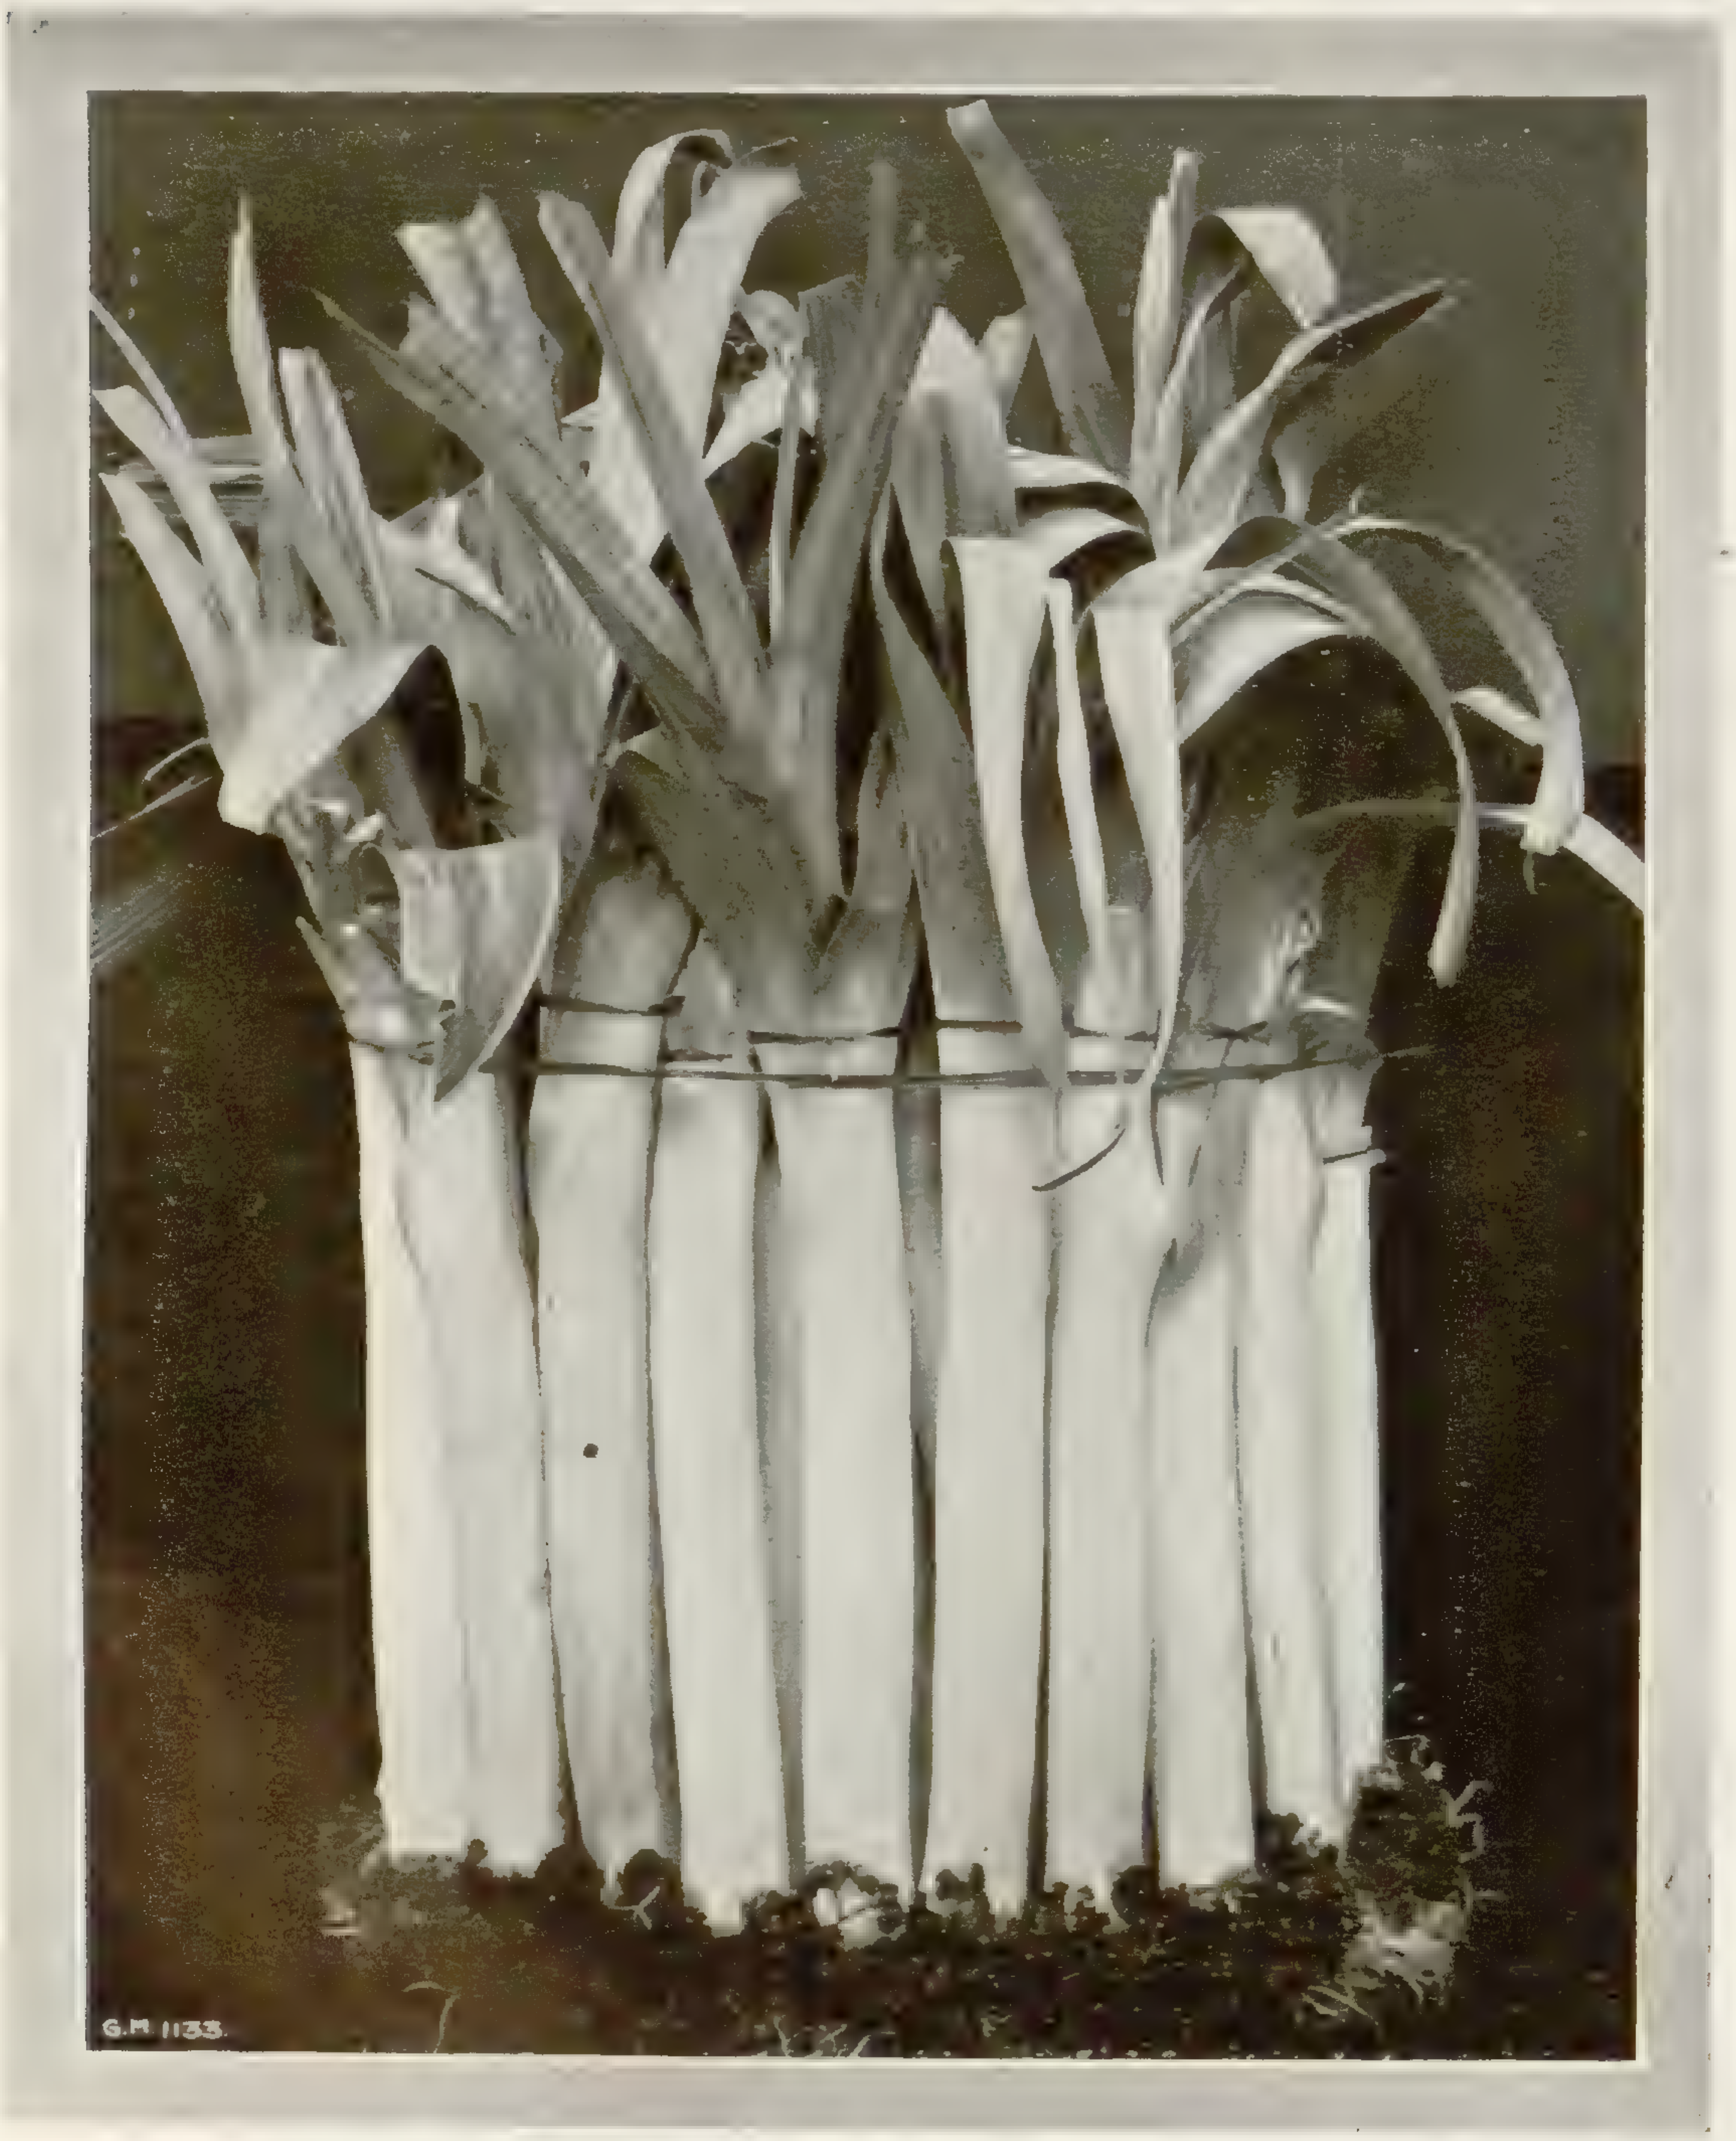
Whatever may have been the length of the time that has elapsed since the leek was grown in gardens in this country, there can be no doubt that its cultivation in the East extends over at least two thousand years. Pliny the younger gives us much information with regard to its history, cultivation, and uses in his "Natural History," which was written nearly two thousand years ago. He states in Book XIX., chapter 6, that the finest leeks were those brought from Egypt, where we may assume they were generally grown; and that next in merit were those which came from Orthe, a town in Asia Minor. In Italy the Riccia district was in Pliny's time famous for leeks, for he writes: "Not long since leeks were brought into great notice and esteem through the Emperor Nero, who used to eat them for several days in every month to clear his voice. He took them with oil only, debarring himself even from bread on these days." With reference to this Delille wrote:

> "Thus Nero lived amidst his motley court,
> His people's terror and his people's sport."

Emperor Nero was not the only individual who has fasted in connection with the leek, if we can accept a statement made by Lord Bacon. In his "Sylva Sylvarum," he writes: "I knew a gentleman that would fast, sometimes three or four, yea, five, days, without meat, bread, or drink, but the same man used to have continually a great wisp of herbs that he smelt on, and amongst these herbs, some succulent herbs of strong scent, onions, garlic, leeks, and the like." With a pot pourri of this kind it is not surprising the gentleman should have fasted.

The old herbals and several other works published in the sixteenth and seventeenth centuries contain lists of the virtues of leeks, but there is little of praise. That bestowed by Gerard is certainly faint, for he says: "Being boiled it is less hurtful by reason that it looseth a great part of its sharpness, and yet, being so used it yieldeth to the body no good juice." In expressing this opinion, our old author differed widely from the views that now obtain; but he had only thin, wiry stems on which to base his opinion instead of fat, well blanched stems, such as are now common.

G. G.



A MODERN TYPE OF THE LEEK.
(Sutton's Improved Musselburgh.)

PLANTING SEASON.

By Appointment.

PAULS' ROYAL NURSERIES,

Waltham Cross, Herts,

Twelve miles from London; South entrance four minutes' walk from Waltham Cross Station (Great Eastern Railway); West entrance three minutes' walk from Tramway Terminus.

SPECIALITIES:

- **ROSES** in all forms, from open ground and in pots. Roses in pots, both dwarfs and climbers, extra fine this season.
- **FRUIT TREES** for the Orchard, Garden and Forcing House.
- **HARDY TREES,** for Street, Park, and General Planting.
- **SHRUBS,** Evergreen and Deciduous, for General Planting.
- **HARDY CLIMBING PLANTS** for all purposes.
- **RHODODENDRONS, CAMELLIAS, and AZALEAS.** Rhododendrons from loam, extra fine this season.
- **HERBACEOUS PLANTS** in great variety.
- **BULBS and SEEDS,** and all Garden Sundries.

Price Lists on application. Inspection Invited.

Upwards of 1,000 Gold Medals, First Prizes, and other Awards at leading Exhibitions during the past 50 years.

Sole Postal Address:—

WM. PAUL & SON,
WALTHAM CROSS, HERTS.
Rose Growers by Appointment to His Majesty the King.

RIVERS'

Fruit Trees, Roses, Vines, Figs, Oranges, AND Orchard House Trees.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

- **RHODODENDRONS,** which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.
- **AZALEA PONTICUM,** 1 to 4 ft., extra fine.
- **CUPRESSUS,** in all varieties, from 2 to 6 ft.
- **HOLLY COM.,** from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.
- **LAURELS** in variety, from 2, 3, 4, 5, 6 ft. high.
- **YEWS, ENG.,** from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.
- **ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC.,** in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

Knap Hill Nursery, Woking, Surrey,

Has a FINE STOCK of well-rooted

EVERGREENS, TREES & SHRUBS

In all Sizes.

Rhododendrons, Azaleas, and other American Plants a Speciality.

Inspection of Nursery invited. Catalogue on application.

CHARLESWORTH & CO.,

Hayward's Heath, Sussex,

ORCHID SPECIALISTS.

IMPORTERS, EXPORTERS, RAISERS & GROWERS.

PRICED ILLUSTRATED CATALOGUE FREE.

ALPHA SPRAYING MACHINES.

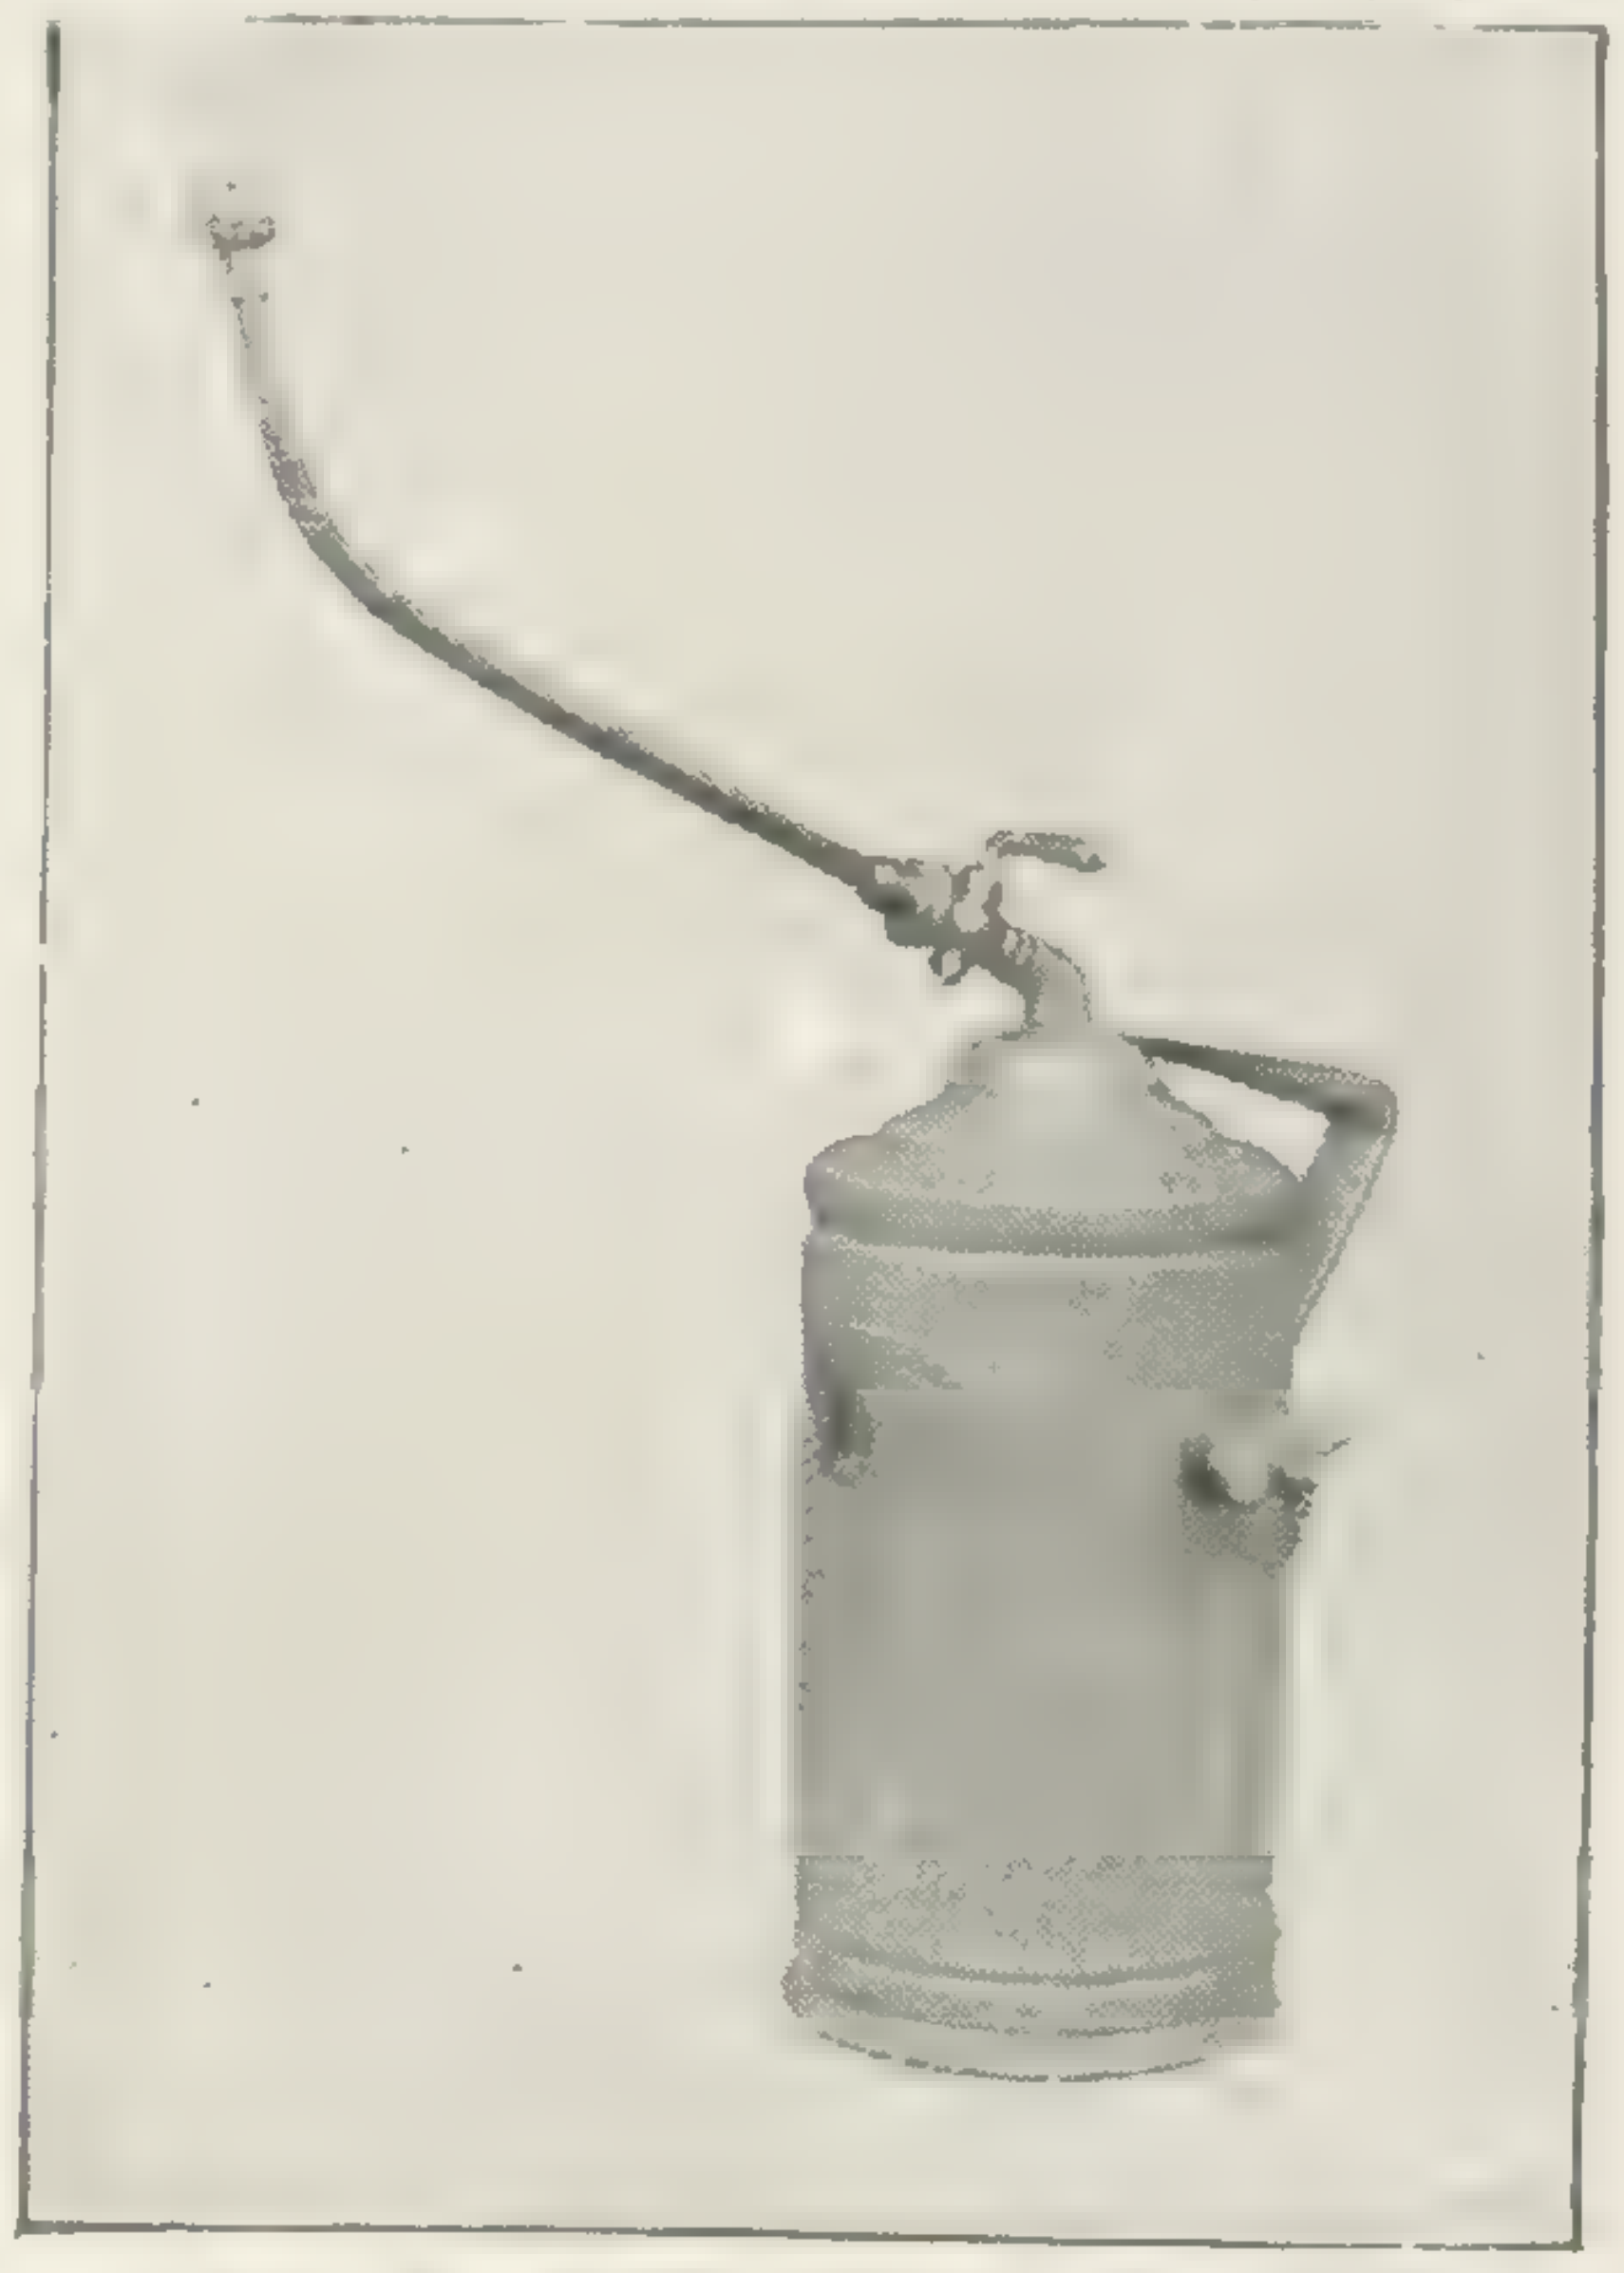
Patent No. 24637/07.

Hydro-Pneumatic Sprayers for Orchard, Garden, Greenhouse, or Conservatory. Large or Small Plantations. Commercial or Private Growers.

The Simplest and most Perfect Sprayers yet introduced.

No constant pumping; once charged, the machine empties automatically.

The **Alpha Knapsack** awarded **First Diploma** at Spraying Competition against the world at Hayes, Middlesex, Tuesday, September 28, 1909.



No. 3. 3-qrt. size, price 17/6.

PRICES.

No.		
1.	Orchid Sprayer, 1 quart	15/0
2.	Propagator's Sprayer, 2 quarts	16/6
3.	Hand Rose Sprayer, 3 quarts (illustrated)	17/6
4.	Lime Washer, etc., 3½ gallons, with fittings complete, including 3ft. Rubber Hose, 6ft. Bamboo Lance, brass-lined, with Powell's patent Spraying Jet and powerful Foot pump	58/6
5.	Knapsack Machine, 3½ gallons, with fittings complete, including 6ft. Rubber Hose, 2ft. Brass Lance, with Powell's patent Spraying Jet and powerful Foot-pump ...	60/0
6.	Portable Sprayer, 5 gallons, with fittings complete, including 6ft Rubber Hose, 6ft. Bamboo Lance, brass-lined, with Powell's patent Spraying Jet and powerful Foot-pump	75/0

Foot-pump for charging Nos. **1, 2,** and **3, 4/6** each.

Full Illustrated Price List upon receipt of card to—

Alpha Extinguisher Ltd.,
ROSS, HEREFORDSHIRE.

GOLD MEDAL ROSES.

Strong, healthy, well-rooted plants of all classes: Standards, Bushes, and Climbers. Also Fruit-trees, Shrubs, etc. Trained Fruit-trees are especially good this year. Send for Catalogue.

WILLIAM LOWE, Rose Nurseries, **BEESTON, NOTTS.**

TREE CARNATIONS.—Best varieties, rooted cuttings, 25, 4s. 6d.; 100, 15s. Plants in pots, 25, 6s.; 100, 22s., carriage paid.—G. S. EVANS, F.R.H.S., Bexley Heath.

GOOD SEEDS.

	Packet
CALCEOLARIA, Golden Glory (Hardy Hybrid)	2/6
REHMANNIA, Pink Perfection	1/-
PETUNIA, Lord Courtenay (bright pink) .	1/-
DAHLIA, Pæony-flowered Dutch Semi-double	1/6

Seed Potato Specialist,
MALLOW, CO. CORK.

ROSE NOTES.

On looking over the budded stocks worked last summer I find them more promising than for many seasons, and hope others are equally fortunate. The majority—even those that do not do so well, as a rule—have set to the stock nicely, and appear plump and sound. It is a mistake to cover dormant buds of this description with manure with an idea of protection, and I have known many serious failures caused by this practice. My own experience is the drier they are kept the more effectually is frost resisted; and the moisture-retaining qualities of manure is against this. Now is a very good time to spread a little well-rotted manure between the rows, and bury it just beneath the surface by very shallow digging. Of course, cut off the top of the stocks first so as not to go on the ground again very soon.

I was admiring a few dwarf-growing Polyantha roses in pots some time back, when the extremes in size of flower found among roses was borne in on my mind very forcibly. By the way, we have very few roses more suited for pot culture than these dwarf polyanthas. They keep such good form, and continue in bloom for so long. We can have roses from the size of a sixpenny piece up to seven or more inches over. Many of these miniature roses are perfect in shape, and some produce the prettiest rosette-formed flowers imaginable.

A few of the hybrid perpetuals bearing large flowers known to me include Antoine Mouton, blush pink; Paul Neyron, deep rose; Rev. Alan Cheales, lake and blush; Her Majesty, satin rose; Bén Cant, clear, deep crimson; Frau Karl Druschki, snow white; Captain Hayward, scarlet crimson; Gustave Piganeau, carmine; Magna Charta, bright rose; Ulrich Brunner, cherry-red. Teas and hybrid teas also include a few varieties which sometimes produce a phenomenally large flower, such as the Cleopatra, shown in the Queen's Cup at Windsor in the late Queen Victoria's reign. I cannot put my hand on my notes of that show, but the memory of the flower will not be lost. After I had carefully measured it, I almost feared to record the size in my report. The exhibitor, the Rev. F. Burnside, told me he had the flower there, but only the roots remained at home! Gustave Piganeau, too, is not fit for general culture, being one of the worst growers. Betty, coppery-rose, has only a few petals, but their immense size gives a very large flower. Comtesse de Turenne, satin rose; Madame Segond Weber, salmon-pink; Mildred Grant, flushed white; Yvonne Vacherot, white; Souvenir d'Elise Vardon, creamy-white; The Lyon Rose, coral-red, produces very large and well-formed flowers. There are a few extra large blooms among the singles, Maharajah is often quite five inches across. This is a grand crimson and maroon, and the best dark single we have. Hon. Ina Bingham, pure pink; Una, pale buff, are also large and good.

But I must not make a catalogue of these notes. When we turn to the growth of roses the extremes are more noticeable still. We have a rose called Little Alfred that is comparatively new, and I never saw it exceed nine inches in height. A contrast, indeed, to the strongest from the Wichuraianas and Banksias, with their growths of twenty feet and upwards in one season. From the remarkable hardiness of the Rugosas, to the tenderness of Cloth of Gold and Macartney alba simplex is very noticeable.

Once more we have tried grafting the Pernettiana roses, and have decided they are not suitable for this method of propagation. Soleil d'Or we ceased to try some time ago, but with the advent of the Lyon Rose all efforts were naturally made to increase stock, but it is not satisfactory with us, although the varieties of other classes are doing well, and these had even more careful treatment. Gottfried Keller behaved the same when we tried it as a newer rose, and we experienced just the same difficulty when trying the Austrian briers during a time of shortage. It was the same with Scotch briers when we wished to increase a certain colour. With the exception of the Scotch briers these roses, fortunately, produce a good number of sound, workable buds during summer, and when these are lifted and potted up in the dormant bud there is no waste of time in working up a stock. But I do not like this excessive propagation of all available wood, either as grafting or budding, feeling sure we should benefit by selection of the best growths.

ORIGINAL TYPE OF THE LEEK.

There would seem to be a great future before standard roses in pots. Indeed, it is surprising to me we have not seen them in more general use long ere this, considering how well they have figured at the various shows. They afford such a great decorative effect in the conservatory, standing well above other subjects, and their pots taking up so little room. Providing a good selection of colours, and lasting well, they also have the advantage of much more certain flowering than most roses. Where some were lifted this season, I would warn against any hasty forcing, or much of the wood will be lost. Grow them steadily the first year, and be sure the pots are plunged, as they have very little root run for so strong-growing a section as those most suited for the purpose.

This is about the most critical time for Marechal Niel under glass, as the growths are pushing actively, and get close to the glass sooner than anticipated. I saw what I thought a novel dodge the other day. A small clinker was depended from the lateral growths, being more or less heavy, according to the strength of the rose shoot. Hung on with a piece of raffia, these are easily cut off as soon as the shoot is drawn away from the glass a little. A. Piper.

TOMATO CULTURE.

For a number of years I grew about 15cwt. of tomatoes annually. This is not a great bulk compared to the produce of large growers for market; but it is large when confined to the glass structures of a private garden.

Of course space was valuable, and I soon realised that, where the plants were grown in a rather loose rooting medium they occupied room, shutting out light from other occupants of the houses. These tall plants did not bear a heavier crop than some very dwarf ones which were grown in very hard compost. The plants were well grown while in the small pots, and were then planted out in the firm soil, the latter being rammed down well while it was rather dry; if wet it would be unwise to so ram it. The result was that about three trusses of fruit set well on the lower 18in of each plant. Up to this stage, no feeding was done, and manures were not mixed with the compost good turfy loam. Afterwards feeding was regularly carried out, and, owing to the weight of fruit already set, the plants still made short-jointed growth, and set more fruits with equal freedom. Cultivators who do not possess much glass may follow these hints. G. B.

VINE BORDERS.

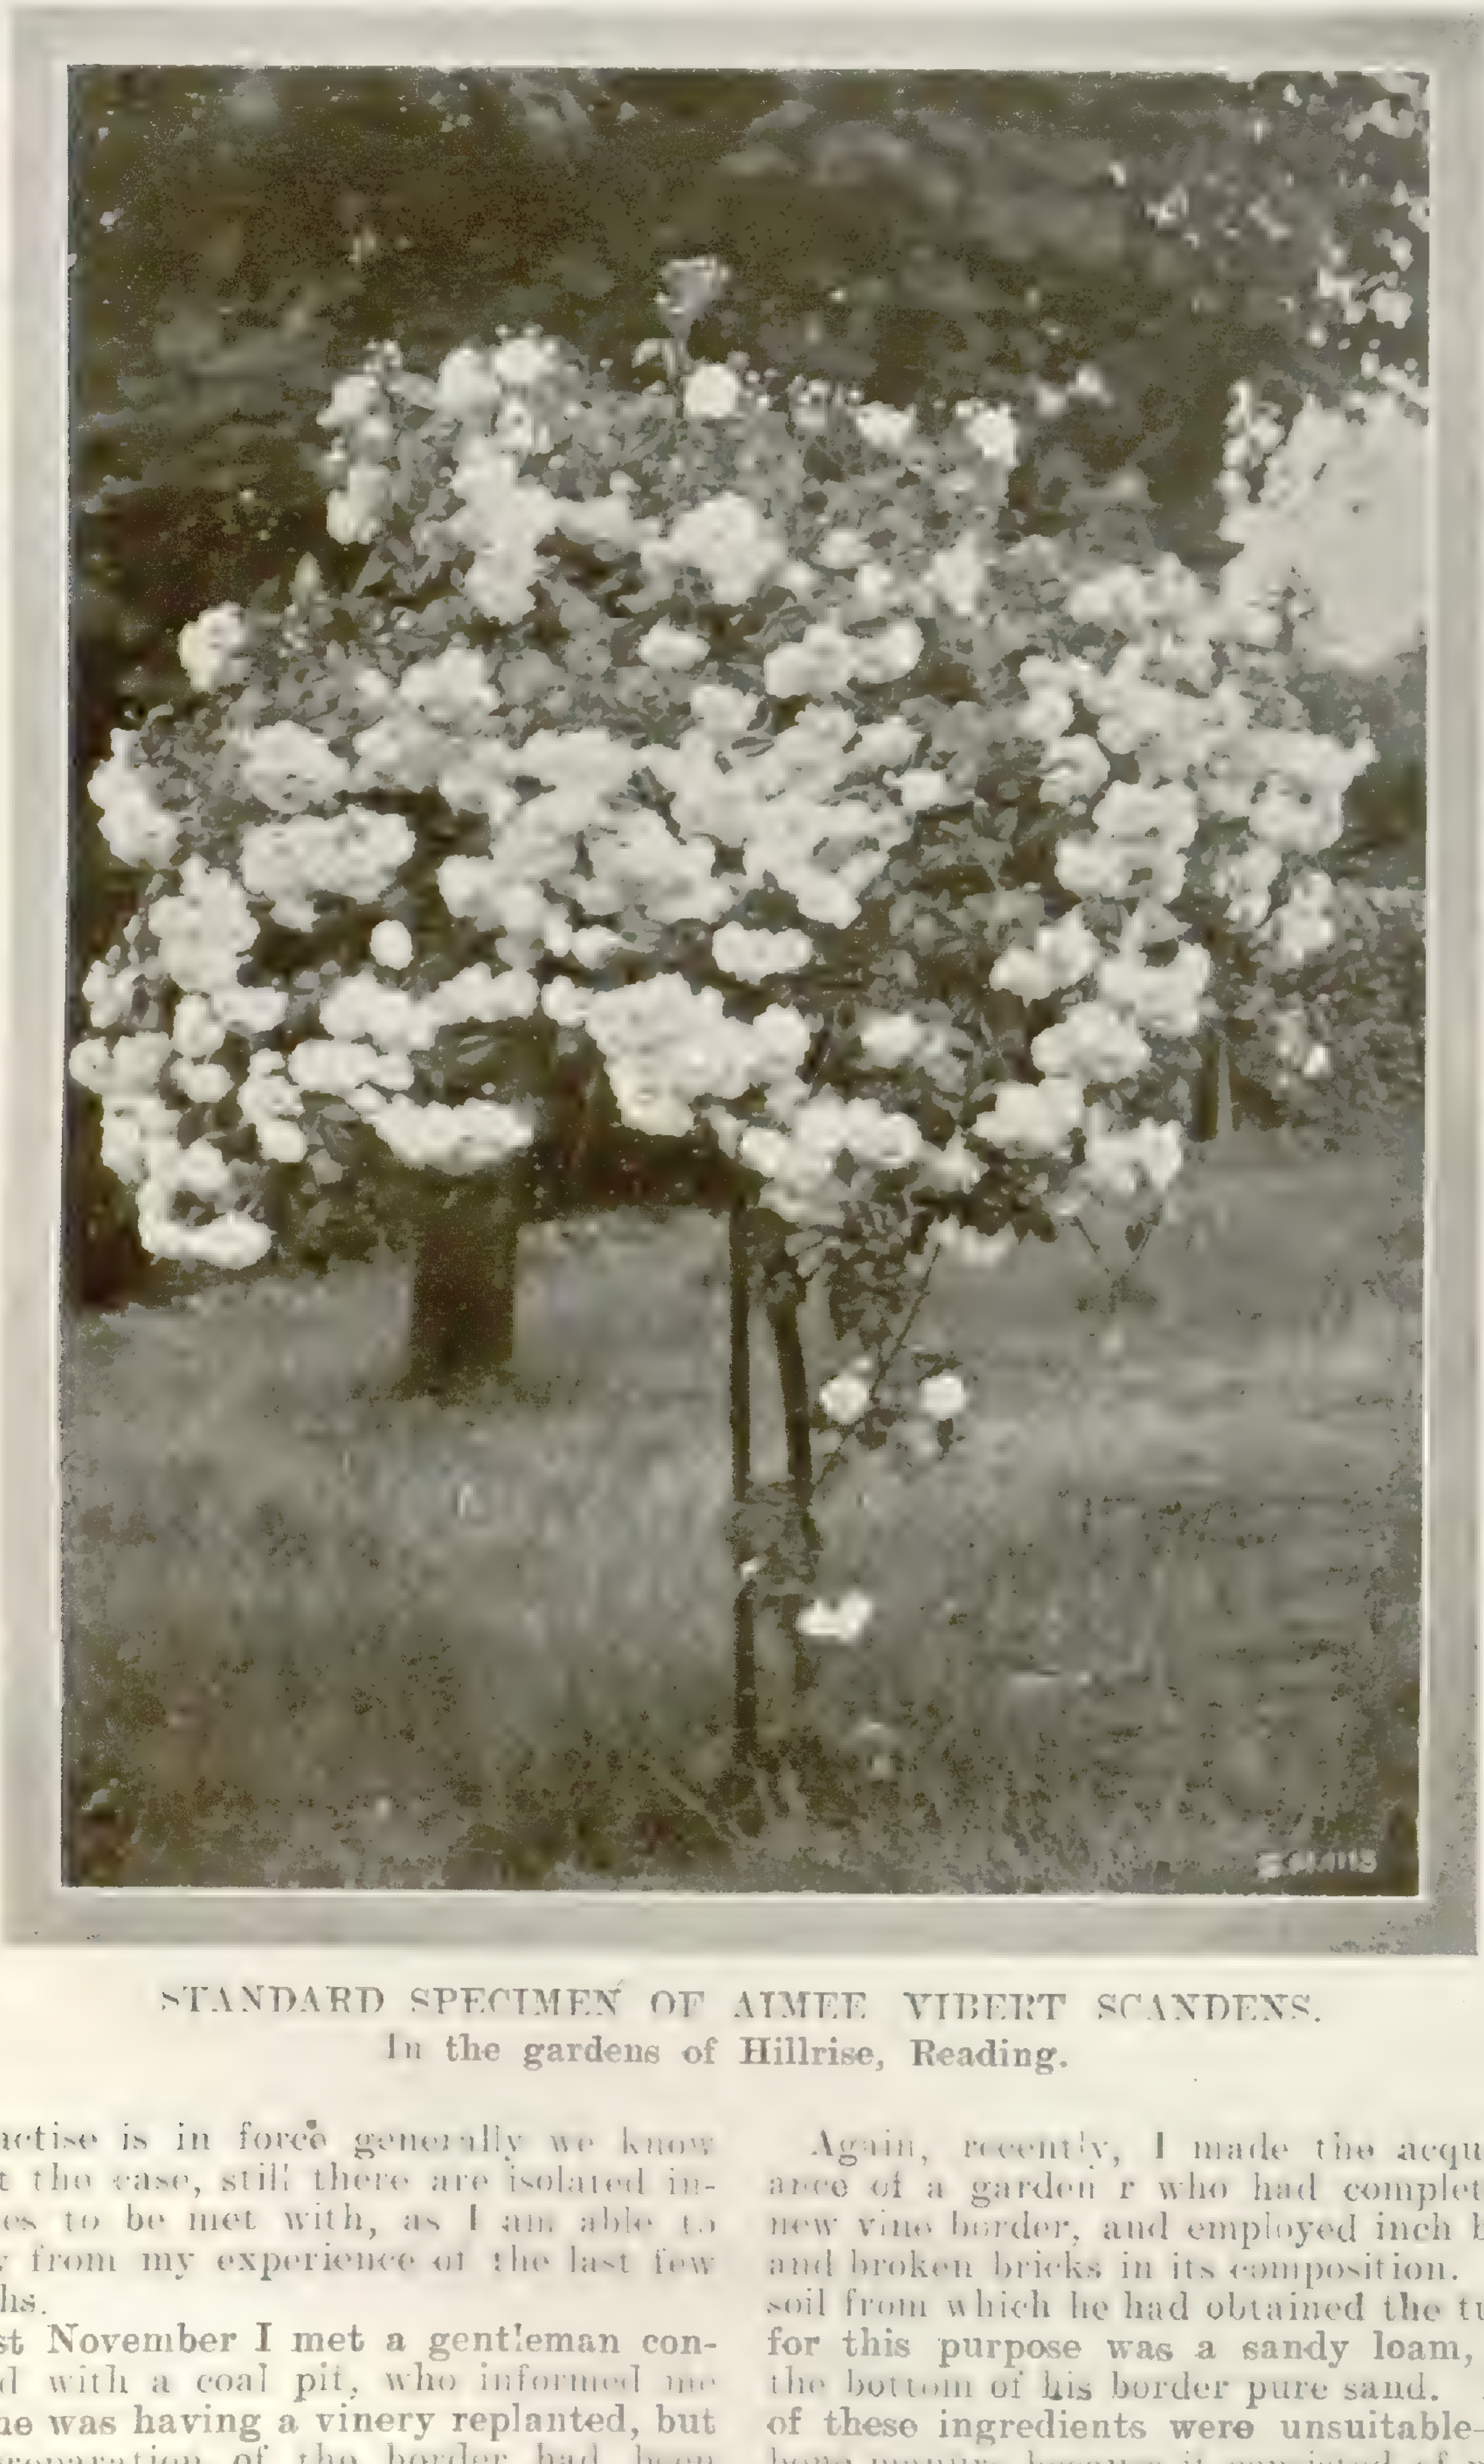
In spite of all the gardening literature of the present day, it is rather surprising to find some of the old and pernicious garden practices still in force. Half a century ago the grand old gardeners fancied they had done a clever thing when they buried the carcase of a horse in the vine border. Time taught them the contrary, and the gardening periodicals have done much to educate those who would read, that nothing more inimical to the welfare of the roots of the vines than this putrid mass could very readily be found. That such a practise is in force generally we know is not the case, still there are isolated instances to be met with, as I am able to verify from my experience of the last few months.

Last November I met a gentleman connected with a coal pit, who informed me that he was having a vinery replanted, but the preparation of the border had been delayed on account of a pig. The pig was sickly, and he waited for some time to see if it would die, as, in the event of it doing so, he intended putting it into the border. As the pig revived a little he made his border without it, but shortly after this abomination of the Jews had a relapse, expired, and, with due pomp and ceremony, was consigned to a grave in the vine border. The owner told me this with the zest which accompanies conviction, and while measuring, in his mind's eye, the penderous bunches and berries of grapes the immediate future had in store for him. When the evil influence of this carcase on the compost of his border was pointed out to him, the gentleman remarked that Mr. ———, gardener to ———, advised him in the matter. So, evidently, in this twentieth century a certain amount of elementary teaching in horticultural matters is desirable, if the wrong impressions of earlier days are to be overcome, and the poisonous character of decomposing carcases in soils made apparent to all.

Again, recently, I made the acquaintance of a gardener who had completed a new vine border, and employed inch bones and broken bricks in its composition. The soil from which he had obtained the turves for this purpose was a sandy loam, and the bottom of his border pure sand. Both of these ingredients were unsuitable—the bone manure because it consisted of pieces that would not dissolve during the lifetime of the vines, and the bricks because they supplied no plant food, and aggravated, rather than ameliorated, the porosity of the soil. Bones and basic slag are phosphate of lime, and the former should be ground to as fine a powder as the latter usually is, before they are utilised for either garden or farm purposes. Nitrates and chlorides are readily washed out of the soil by rains, but phosphates have an affinity for the earthy particles, and remain within the medium till assimilated by the roots of plants. In a fine state of division phosphates are readily available as plant food, and crops derive benefit from their presence. On the other hand, when they are present in large pieces, such, for instance, as inch and two-inch lumps, phosphatic-loving plants may languish in the soil in spite of the abundance of this plant food. Ground bricks are only used in very heavy soils to render them more porous. They are an evil, but when dealing with very tenacious stratums they counteract, to a more or less degree, the imperviousness of the mass.

When old plaster or lime rubble is available either of these will serve the purpose of drainage, and yield a supply of lime, and, in the case of old plaster, potash as well. It will therefore be seen that the primitive practice of incorporating broken or ground bricks with the soil of a vine border is out of harmony with modern enlightenment and methods, and may be regarded as a mark of antiquity only.

Pedestrian.



STANDARD SPECIMEN OF AIMEE VIBERT SCANDENS.
In the gardens of Hillrise, Reading.

ROSE CLIMBING AIMEE VIBERT.

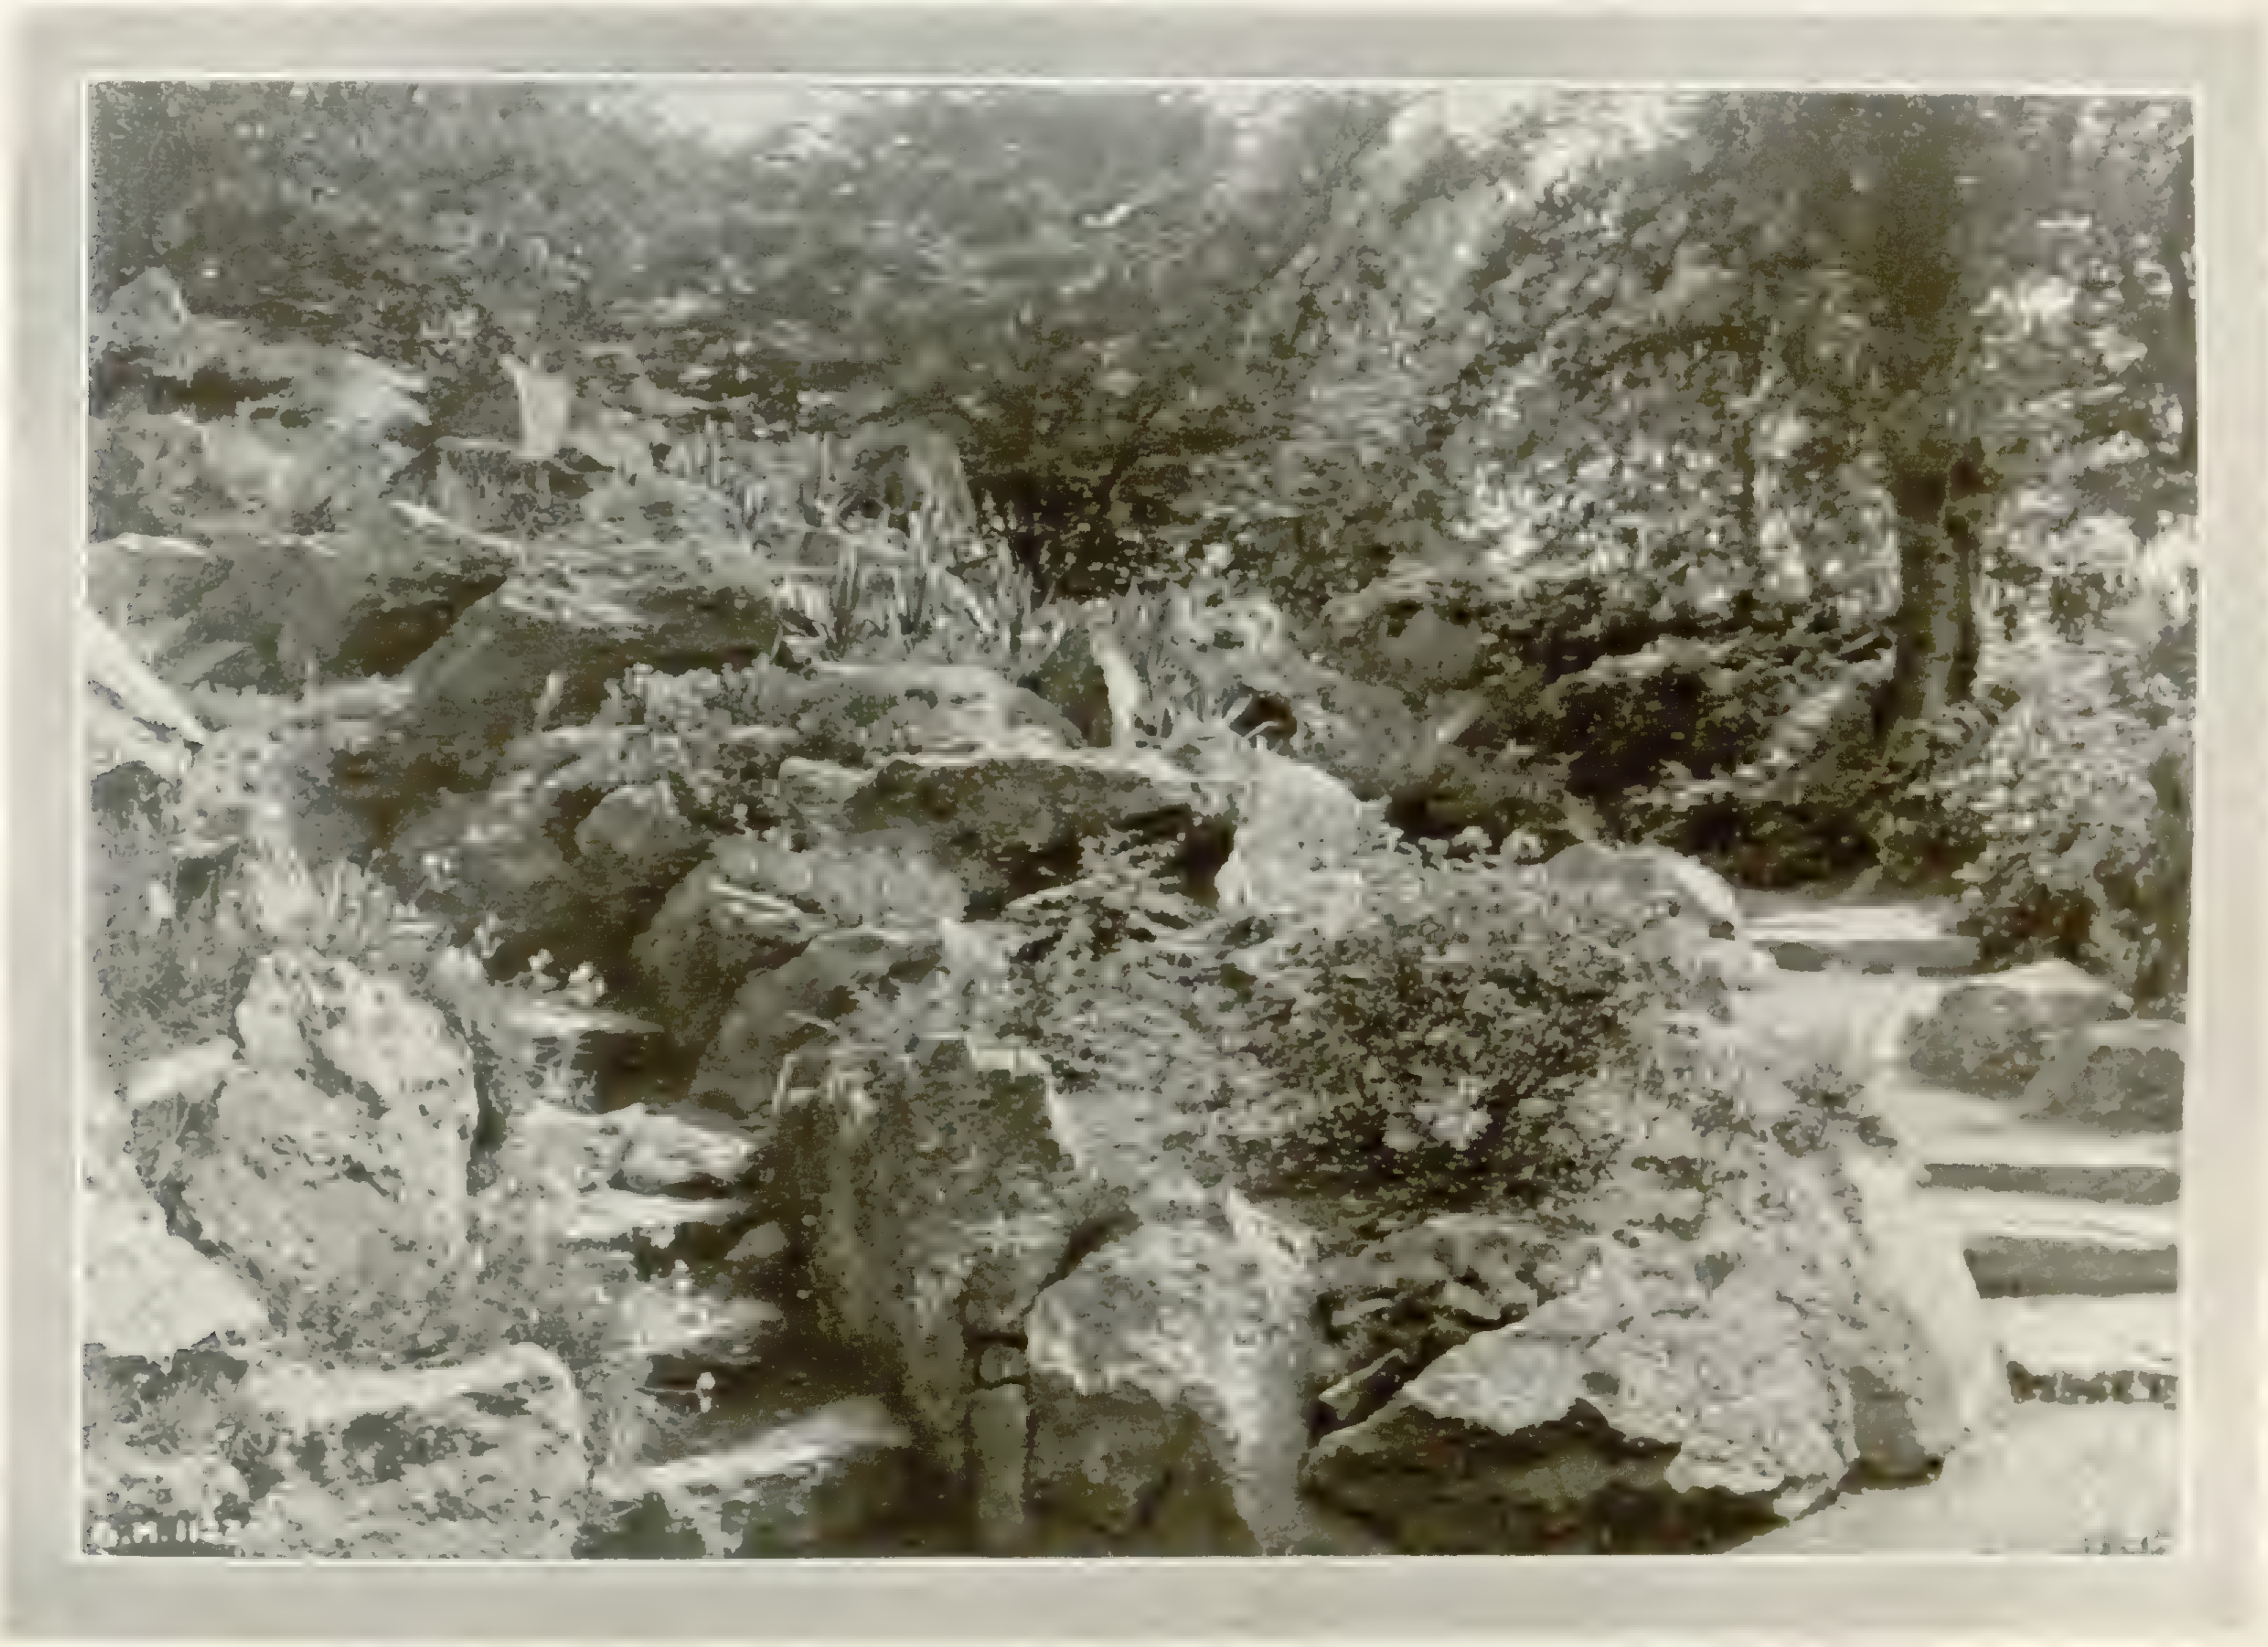
Rosarians have evidently much the same peculiarities with regard to their favourites as other sections of the flower loving community, and one of the most noteworthy of these is perhaps the reluctance with which a departure is made from traditional methods. In the earlier days of rose culture in this country, custom decreed that roses of slender rampant growth should be trained to walls and trellises, or be utilised in the formation of arches, while those of erect growth should be grown as bushes or in the form of standards. The climbing roses were then as now the best of the sections for clothing large spaces with flowers and foliage, but it did not necessarily follow that they could not be successfully grown in other ways. As a matter of fact, some of the best of them make the most effective standards, but we had to wait more than half a century before their suitability for this purpose was recognised. The climbing form of the beautiful pure white noisette Aimée Vibert is a case in point. Upwards of sixty years have elapsed since it was introduced into cultivation, and although possessing in a marked degree the qualities that render it of value for cultivation in standard form, it is only now and then that standard specimens are met with in gardens. In the ballot for the best white climbing rose, flowering in clusters that was conducted two years since by the National Rose Society, it obtained the premier position by an overwhelming majority. There can be no question as to its exceptional value for covering large wall spaces, pergolas, trellises, and arches, and it is certainly not less valuable for training to form weeping standards. The growth is light and elegant, and, being rather stouter, does not hang quite so straight down as does that of some of the Wichuraianas when grown in a similar manner. In freedom of flowering it has no superior in its class, and the bright glossy green leaves are retained throughout the greater part of the year. The specimen herewith illustrated is growing in the charming gardens of Hillrise, Reading, the residence of Leonard Sutton, Esq., and a better proof of the suitability of the variety for growing in standard form could not be desired.

G.

WATER SCENERY.

One of the most interesting features in connection with present-day gardening is the increasing popularity of scenic effects in the garden in which water plays a predominant part. It may be that all gardens are not adapted for the introduction of water effects, but in justification of its inclusion, when practicable, one must say that frequently the beauty of the garden is doubled by the judicious use and treatment of water.

There are so many opportunities in larger gardens for additional improvements along the line indicated, that one should not hesitate to make the fullest use of water scenery whenever the opportunity arises. The various aspects of water gardening present to the gardener decided and praiseworthy means of rendering the grounds under his control much more attractive to his employers and their guests, and of enlarging the sphere of interest in garden studies, to the mutual advantage of employer and employees. Take, for example, the possibilities of lily ponds and pools. In these one can devise such a garden of summer beauty as will dwarf the pretensions of any formal flower garden or a glowing border of perennials.



A VIEW IN THE ROCK GARDEN, BOTANIC GARDENS, EDINBURGH.

It is not my intention in these notes to urge upon the reader particular varieties of chosen plants, but rather to draw attention to the whole race of aquatics and moisture lovers, in the hope that it may further, in a small degree, the interest and love of this most charming phase of garden adornment. With reference to the association of true aquatics with the garden pond or pools, one is not forced to accept any stereotyped design or varieties, but rather to choose, from among the wealth of subjects that are available according to individual taste, both as to the types of plants employed, and their arrangement of colouring.

The nymphæas, or water lilies, which always have had so great a charm for the flower lover, should certainly be included in all schemes, though with the recent acquisitions, which embody so many sterling forms, the group assumes such dimensions that one has an exceptionally fine range to choose from. The effect of well-arranged pools, with the water gently shimmering under a summer sun, and their lovely burden of lustrous foliage and glorious blossoms, is one to be remembered. The colourings, too, run through such a delightful range of shades, including white, primrose, yellow, blush, pink, salmon, rose, crimson, etc., and enlivened by the suffusion of so many intermediate hues, that, given a fine collection, the grower might well be satisfied by the diversity and beauty of his lily pool. One might well be enthusiastic over the nymphæas, and then when the range of beauty included in the other aquatics, such as nuphars, villarsias, alismas, hottonias, aponogetons, hydrocharis, sagittarias, ranunculus, and typhas, is remembered, one at once realises that the possibilities of the water garden are indeed boundless.

Again, when one bears in mind the advantages of embellishing the margins of the ponds and streams, with the host of moisture-loving plants, the possibilities of water becomes better understood. The semi-aquatics, which grow well with their roots submerged in shallow water, include the glorious calthas, the mimulus, myosotis, cyperus, juncus, acorus, and butomus, the wonderful series of moisture-loving plants, which do so splendidly just above the water's edge, as the astilbes, cimicifugas, epilobiums, funkias, irises in variety, lobelias, primulas, trollius, lythrums, lysimachias, rodgersias, and gunneras, and beautiful osmundas and onocleas.

Careful selection and arrangement of some of the above subjects will prettily frame those lily pool pictures, and render the banks of the streams and brooks a veritable haunt of beauty. Certain it is that by the carefully considered use of waterways and water-loving plants, the province of the garden decorator is considerably extended.

P. S. Hayward.

EDINBURGH ROCK GARDEN.

The illustration of a portion of the remarkably fine rock garden in the Botanic Gardens at Edinburgh that we have now the pleasure of giving was intended to accompany the important paper by Mr. W. Irving on the making of large rock gardens, which appeared in our issue of the 26th ult. Owing to the pressure on our space we were compelled to leave it over, but it suffers nothing from the short delay in obtaining publicity, and our readers who are interested in this aspect of gardening will not fail to appreciate the object-lesson it affords in the arrangement of the steps by which access from the path is obtained to the higher levels. The Edinburgh rock garden has been greatly extended within a quite recent period, and the manner in which this has been accomplished has brought much praise to Professor Bayley Balfour, V.M.H., Mr. Harrow, and others concerned. The enlarged rock garden has indeed been so great a success that it has created much interest in Edinburgh, and as one result, the question of forming a new rock garden in one of the public gardens belonging to the city came before the Corporation at a recent meeting. The suggestion was favourably received, and it was referred to Mr. McHattie for consideration and report.

JOTTINGS: CRITICAL AND OTHERWISE.

In a recent article on spraying Mr. Frank Hammond observed that winter washing is not going to cure all the evils that fruit-growers suffer from any more than is grease-banding or any other operation. I quite agree with him, but I contend, nevertheless, that for the prevention of damage by the caterpillar of the winter moth, grease-banding is the best preventive remedy known. Quite recently I visited an orchard consisting of several hundreds of big standard trees. Last season caterpillars did a lot of damage, and with the object of preventing a repetition of the trouble, the occupier of the orchard resorted to grease-banding last autumn. Long before Christmas the bands were simply covered with moths, both male and female, and if one could have counted them the figures would have run into hundreds of thousands. It is quite natural to suppose that the destruction of all these moths must make a difference to the damage that their offspring would otherwise have done; and speaking of grease-banding, the fruit growers in the Evesham Valley are a pretty shrewd lot, who do not spend their money without a prospect of getting value for it. Nevertheless, the Evesham growers are grease-banders almost to a man, and it would be difficult to say what they would suffer through the winter moth pest if they relaxed their combined efforts in preventing its ravages.

A friend of mine, who was about to plant an orchard of standard fruit trees a short time ago, read advice to the effect that it was always advisable to get out the holes some time before planting, with the object of exposing the soil to the action of the weather. My friend followed the advice. Rain began as soon as the holes were dug, and for several weeks they stood full of water, during which period, of course, planting was impossible. Even when matters improved the conditions were most unpleasant, the soil being wet and sticky and difficult to work, with the result that the trees not only went in badly, and it took twice as long to plant them than would have been the case had circumstances been different. Another planter saw the danger of getting out holes for standard trees beforehand in a season when it has rained incessantly, and, after waiting for fine days, got out the holes as he wanted them, and planted the trees straight away. The result was that he completed his planting while his neighbour was waiting for the water to drain out of the holes, and the trees went in splendidly, with about half the cost for labour. Probably the scribe who gave the advice referred to above had planted trees in a dry autumn, not in the midst of a wet winter, but the logic is obvious, if you are not sure of the weather, and it is hardly possible to be, dig your holes as you proceed with planting rather than run the risk of having them stand full of water for several weeks.

I should like to supplement the remarks of "G. B.," on page 48, with reference to the good qualities of Court Pendu Plat as a dessert apple, and I am quite sure that this variety is worthy of extended cultivation. In several places in the West of England Court Pendu Plat is largely grown as standards in grass orchards, and it is one of the best dessert apples for this class of cultivation. One of the characteristics of the variety is that it flowers late, so late in fact that it is often dormant when other apples are in bloom, and it is therefore suitable for planting in low situations where late frosts are liable to do damage. Again, on account of its lateness, Court Pendu Plat is not so liable to suffer through insect pests as some others. I do not say that there are not better flavoured apples than this, but after Christmas, when Court Pendu Plat is at its best, it is quite good enough, and its bright colour and even character make it popular in the market. It is a splendid apple to pack, and when put up in small boxes (which class of trade appears to be gaining in popularity) the fruits present a very pleasing appearance. To give an idea of the keeping properties of Court Pendu Plat, I may add that some fine specimens of it, picked from orchard trees, were exhibited at the Royal Agricultural Show at Gloucester last June.

Quite elaborate in detail was the article from the pen of Mr. J. C. Newsham on the Cultivation of Exhibition Onions, and would-be prize winners would doubtless read it with advantage; but apart from the exhibition aspect, does anybody want big onions? I think not, and I question, therefore, whether it is worth while going to all the trouble and labour necessary to produce even modest bulbs of 2lb. apiece. Let me illustrate two cases. Last year two men set out to grow onions, and one of them was bitten with the big-bulb craze. He went to a lot of trouble in raising early plants, he trenched deeply, manured liberally, and attended to all the details known to big onion growers. As the result, he produced long drawn "ohs" of surprise and perhaps admiration from the people who saw the crop of monstrous bulbs. The other man sowed his onions in a box in February in a frame, pricked them out at the beginning of May six inches apart with fifteen inches between the rows on a well-prepared bed, and the after-cultivation consisted merely of hoeing. He probably didn't grow a single onion weighing a pound, but every bulb was practically the same size, the total weight of crop from the bed was in excess of the other man's return, and the well-harvested specimens of medium size had a commercial value which the two-pounders never possessed. The fact is, of course, that neither cooks nor housewives want two-pound onions, so what is the good of growing them except to win prizes, for the type of onion which stands triumphant on the show-board finds little or no favour either in the kitchen or the greengrocer's shop. All the same, I think the growing of big onions has not been without its benefits, because by a modification of the same system of culture one is able to grow a heavier weight of medium-sized and useful bulbs than is generally possible by sowing the seeds out of doors.

May I be allowed to say that the Sweet Pea number of the Gardeners' Magazine was just what such a number ought to be. Sweet peas predominated from beginning to end, but there was just that nice little variation of matter that is wanted to suit the taste of readers, who, though they may be sweet pea lovers, can think, and talk, and read about others things as well. As I see it, there are two worlds of sweet pea growers, one active and vigorous, the other quiet and unknown. The first section constitutes the authorities in the sweet pea world, the raisers, the exhibitors, writers of sweet pea literature, and, shall I also add, the cranks, for there are a few of these in the sweet pea world. The second division reminds me of the silent voters at election times, they make no shout, but do their bit in the cause they believe in. Our second world of sweet pea growers comprises thousands who never set up a flower at a show, never squabble about who was the raiser of such and such a novelty, but are rather content to grow the variety after it has passed the novelty stage, and can be purchased at a reasonable price. To these individuals the sweet pea is just a beautiful garden flower which they love for its own sake, and they would continue to love it even if the sweet pea craze came to an end, no more new varieties were introduced, and sweet pea shows became a thing of the past.

Speaking further of sweet peas, Mr. C. H. Curtis, the energetic secretary of the National Sweet Pea Society, recently observed: "Under present conditions, the multiplication of names for varieties that present only such differences as exist between Tweedledum and Tweedledee can only lead to one end, and that will be a slump in the named varieties, and an enormous loss to the trade." I quite agree with this outspoken remark, and I do not look at the matter from the point of view of either the trade or an exhibitor, but as one of the hundreds of sweet pea growers, who do not want to buy a variety under a certain name, grow it, and when it comes into flower find that they have already got it, or something so much like it that only an expert can see the difference, under a different title. That the similarity of so many so-called distinct varieties of sweet peas is a source of confusion and annoyance there can be no doubt, and another great mistake is the anxiety of raisers of sweet peas to send out novelties before they are fixed. Last year I had experience of this in three or four cases, and as a result of it I am now going to be content with being less up-to-date in the way of varieties, but I shall have the satisfaction of knowing that those I purchase are what they profess to be.

I wonder if there was ever a winter when some precocious primrose or other plant did not see fit to send up a solitary blossom or two out of their proper season. We, in the country, often see these things, but beyond a casual remark pay little heed to them. Not so the enterprising journalist who caters for the daily press. In the solitary wayside primrose in the winter, which is only a poor apology for a flower, after all, he sees material for copy, and the day after the world is made wiser respecting the doings of a little wild plant in some secluded hedge-row. Matters of greater importance are looked over in favour of this event, perhaps because they are more commonplace, and, in a way, a precocious wild plant blooming out of season is given wider fame, through the medium of the daily press, than the flowering of any choice exotic. It is funny, but even in the rush of election news the primrose which blooms in January has not been crowded out of the columns of the morning press. Its doings appear every winter, and there's always room for notice of the event.

H.

The American Cowslips, of which Dodecatheon media is the best-known species, are pretty dwarf growing plants that succeed in any cool moist loam. The flowers are carried upon slender unbranched stems in the form of drooping umbels, the individual flowers resemble those of the cyclamen in having the segments reflexed, with the anthers and pistil protruding beyond into a fine point. The seedling forms of D. media are taller-growing, the flower stems attaining a height of fifteen inches; the colour range is also greater, varying from white to lilac, purple and rose. Dodecatheons flower during May and June; they are perfectly hardy and perennial in character, the growth is deciduous, so that no evidence of them is left above ground during winter.—Thomas Smith.

THE CATKIN BEARERS.

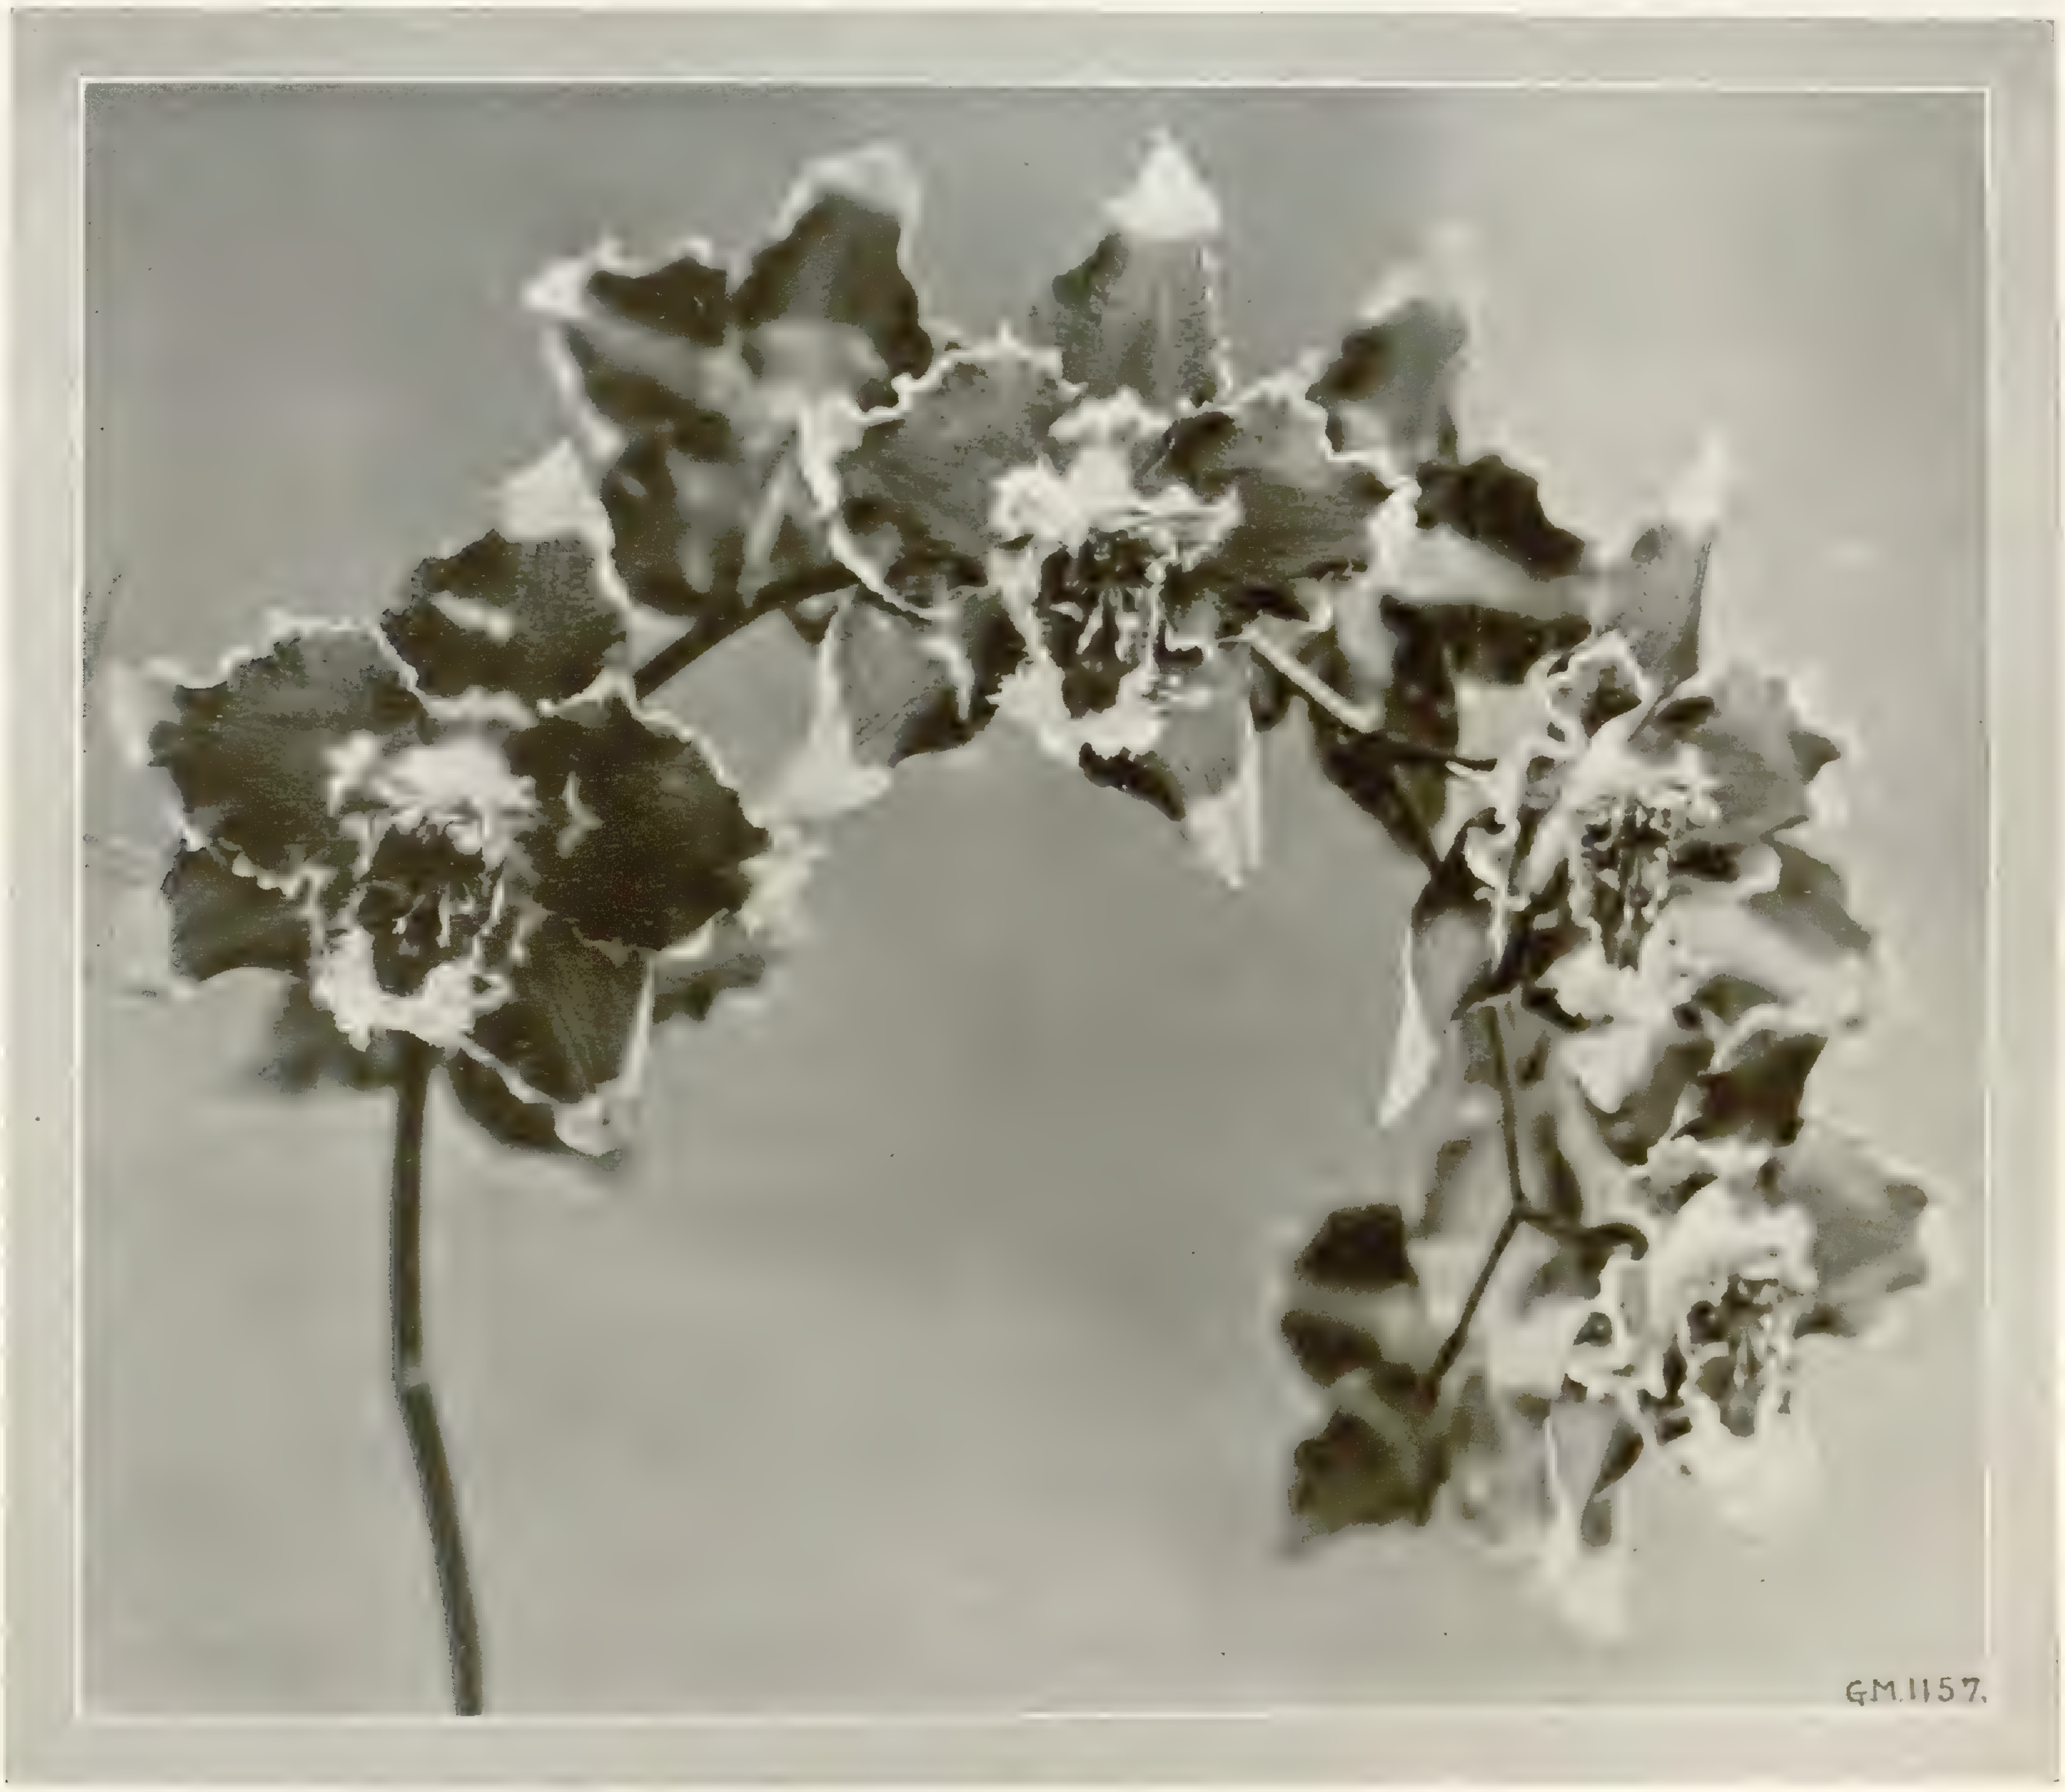
Attention is less frequently drawn to the various trees and shrubs which bear their flowers in catkins than to others which produce individual blooms of a more showy character, yet many of these catkin-bearing trees are decidedly ornamental when in bloom. Those which bear their flowers late in winter and early in spring are doubly valuable, for they serve to brighten up the garden at a naturally dull season. It is, as a rule, to the male-flowered catkins that we are indebted for the best effects, for in most instances the female inflorescences are small, and it is only by close inspection that the tiny styles, which are sometimes red in colour, are distinguishable. As these trees depend largely on the wind for the fertilisation of the flowers, it is only to be expected that pollen will be abundant, and this is the case. It is, in fact, the pollen-laden stamens, in many cases, which are responsible for the showy character of the catkins.

One of the most familiar examples of a catkin-bearing shrub is the common hazel, Corylus avellana, and many a copse and hedgerow is brightened during February and March by the yellow catkins, which may be up to three inches in length. In gardens, the filberts may be made to combine the use of flowering bushes in spring and fruiting plants in autumn, whilst in those places where the Constantinople Hazel, Corylus colurna, is grown, owners have the advantage of a good-sized round-headed tree covered with catkins. The poplars form a large group of catkin-bearing trees, and many of them are decidedly showy. The Balsam poplar, Populus balsamifera, bears catkins four or five inches long, while P. deltoidea, P. canescens, P. nigra, and various others, are showy. Perhaps the most ornamental of all the poplars is, however, the aspen, P. tremula, for in this instance the catkins are about four inches long, and pinkish in colour, with greyish scales. The catkins are likewise thicker than those of most of the other poplars, and they are borne in large numbers. The pendulous branched form is preferable to the type, for the branches hang in long streamers, which when covered with inflorescences are very effective.

Various willows make a brave show when laden with catkins, and some may be found in flower from January to June. The first to commence flowering is Salix cinerea var. Medemi. This has dense catkins two to two and a-half inches long, and one-half to three-quarters of an inch wide, and is at its best late in January and during February. The latest flowerer, on the other hand, is S. pentandra, which opens its blossoms in June, after the leaves have developed. Between these there are many kinds to choose from, good ones being S. aurita, S. babylonica, S. ramulis aureis, S. Caprea, S. daphnoides, S. discolor, S. fragilis, S. lanata, S. phyllicifolia, S. purpurea, and S. viridis. The female flowers on both poplars and willows are borne on different plants from the males, and are in greenish catkins. There is, however, one willow which combines male and female blossoms in the same catkin, this one being S. sesquitertia. The male flowers appear near the base of the catkin, and the female about the apex. Why this curious arrangement should occur is difficult to imagine, without it is that through being a hybrid the crossing of two or more species may have exerted some peculiar influence on the offspring. The shrub is stated to contain sap of three species, S. purpurea x aurita x phylicifolia.

Amongst the alders are several showy trees, the catkins, in most instances, being three inches or more long. Alnus glutinosa, A. cordifolia, A. incana, A. orientalis, A. tenuifolia, and A. viridis are all good. A very ornamental form of A. incana is found in ramulis coccineis. In this case the young bark is red, and contrasts well with the yellow flowers.

The birches, as a whole, are less showy than the poplars, willows, and alders, but the rare Betula Maximowiczi is an exception, for the catkins are three to four inches long, and almost a third of an inch in diameter. The frequently noted Garrya elliptica is well known by reason of its greenish catkins. It is a very ornamental shrub when in bloom, and a good evergreen. The oaks and hornbeams are other catkin-bearing trees, but as the catkins appear with the leaves they are less striking than those of the above-mentioned trees. The sweet chestnut, on the other hand, bears its catkins after the leaves have attained their full size, but they are five to six inches long, strong, and showy.



ODONTOGLOSSUM SPLENDENS.
Flowers brownish-red and purple. F.C.C., R.H.S., February 22. Messrs. Sander and Sons.

They are, however, attended by a disagreeable odour, which detracts somewhat from their value. Fagus sylvatica, the beech, is included in the group, but the same objections may be applied to this as to the oak, for the catkins are not sufficiently showy to make them specially noticeable amongst the young foliage. The walnuts and caryas both bear catkins, and several of them are distinctly interesting. They are, however, more or less green or yellowish-green, and the chief attraction lies in some of them being very long. Perhaps the most striking of all is Juglans cordiformis, which bears pendulous inflorescences nine inches to a foot or more long. By the above list it will be seen that there is a fairly wide selection of catkin-bearing trees and shrubs which may be used for decorative purposes. D.

GESNERA ROYAL ORANGE.

I was very much interested in the illustration and description of the above (page 127), as the habit and colour of the plant closely resemble an old favourite of mine, which I picked up in such an odd way that I think it possible for both to be the same thing. In 1878 I was foreman in the gardens of the late Sir Robert Jardine, Bart., at Castlemilk, Dumfriesshire, Scotland. In the spring of that year we had a consignment of orchids, and among the material attached to some of these the gesnera to which I refer sprang up. Thinking it might be worth cultivating, we carefully removed it with a piece of the bark and other matter in which it was growing, and gave it separate treatment. In November of that year we were well repaid for our care for, besides the ornamental foliage, the plant produced a mass of bloom of an orange-scarlet colour, in a pyramidal form of growth, rendering it a desirable object for either room or conservatory decoration.

It was determined to increase the stock, so after the growth was matured and had died down, all the bulbs were selected, put in a box containing leaf-mould, placed in a temperature of 60 deg. and watered when necessary. When sufficiently large to handle the young plants were potted up singly and grown on. The only thing in their culture to guard against was moisture on the foliage, as it destroyed the velvety gloss of the leaves, and tended to rot them. After leaving Castlemilk I was able to obtain bulbs of this gesnera, and grew it at Duncombe Park and Castle Howard, Yorkshire, for many years. During those years I gave some of my friends in various parts of the country a few bulbs to enable them to raise a stock, and in this way it became distributed. I never met anyone who could name this gesnera. Its usual time for flowering was the month of November. If it should be desired to compare Royal Orange with the variety I refer to I daresay plants could be obtained at Duncombe Park, Helmsley, Yorks, and Castle Howard, Yorks. In any case, Royal Orange would be a suitable name for the plant which turned up with the orchids at Castlemilk, and if this form should happen to be one and the same thing, Mr. Dickson will have done something in getting it enrolled as a variety.

J. Riddell.

Broad Beans.—A good breadth of these should now be sown in an open and well-prepared position; these will be found to give generally better results than the autumn-sown ones, which, too, have to contend with the ravages of slugs on most soils.
—George Ellwood.

SUMMER ONIONS.

Each season confirms the views that I expressed many years since with regard to the method and cultivation of this very important and universal vegetable. It was then the exception, rather than the rule, to sow the seed under glass, and transplant the young plants, in genial weather, during the month of April, but now we find quite the majority of vegetable growers adopting this practice, and certainly all the leading exhibitors. This system, independent of growers for exhibition, has very much to recommend it, and perhaps plants raised in this way are seldom injured, or very slightly, by the larvæ of the onion fly. Another very important factor is that early-raised plants have a much better chance of attaining full maturity, which means that their keeping properties are much better assured. This may either be adopted on a large or small scale, and I am fully persuaded that the extra trouble incurred will be more than repaid. Well-grown large bulbs are in every way superior to those which are imported annually from foreign countries, and if care is taken in harvesting and storing, there is no reason why these should not keep in good condition till the middle of April.

Raising Seedlings.

Opinions differ somewhat as to the time the seed should be sown, but for all general purposes I consider from the 10th to the end of February is the most suitable. If raised too soon a large percentage of the plants will frequently prematurely produce flower spikes, and when this is the case they are useless, except for immediate use. The great point is to prevent, after the seedlings appear, any check to their growth. The compost should consist of two parts good fibrous loam, one of well-decayed leaf-mould, one part old mushroom bed manure, the two latter to be passed through a fine-meshed sieve. Add sufficient coarse road or river bed sand to ensure a free passage for water. This should be thoroughly mixed, and used in a moderately dry condition. Suitable seed boxes should be employed, and these must be well drained, placing sufficient coarse fibre over the drainage to prevent the soil mixing with it. The boxes should be filled to within half an inch of the top, and made very firm. Scatter the seed thinly and evenly over the surface, which should be just covered with the soil, and pressed down firmly. Give a thorough watering, and place where there is a very gentle heat. An early fruit house, which is just about being started, will suit admirably. Immediately the young seedlings appear place them as near the glass as possible, and when of sufficient size they should be pricked out into other boxes. Use a compost similar, but of rougher material than with which the seed boxes were filled, and add a small quantity of bonemeal. Prick out three inches apart each way, again making them very firm. Grow on in a temperature of about 55 degrees, and frequently spray with tepid water. After they have made a good start, they should be removed to a more airy structure, a stout growth being most desirable. Occasional light dustings of soot will be beneficial, as will be the stirring of the soil with a pointed stick. Later on remove to an unheated frame, and give an abundance of air. Remove the lights entirely whenever possible, so that the young onions are thoroughly hardened before planting out.

Preparation of the Ground.

It is absolutely essential that the site upon which onions are grown be heavily manured and very deeply worked, and this should certainly be performed during the winter months. Good farmyard manure is quite the best for incorporating with the soil. The ground should be trenched to the depth of three feet at least, and two layers of manure worked in, and the surface left in as rough a state as possible. Should the land be destitute of lime, give a good surface dressing of this fresh from the kiln immediately after the trenching is performed, and one or two dressings of fresh soot should be applied during the interval of trenching and planting. A good open site ought always to be selected for this crop, and there is no reason whatever why the same plot should not be used for onions for many years.

Planting.

With regard to the exact date when planting should be carried out, much will depend on the weather and the locality in which one resides, but, as a general rule, this should be done some time during the month of April. Providing they have been well hardened, the frosts we are likely to have after this time, or cold winds, will not harm them. Fork over the surface, and afterwards rake it down to a fine tilth. The rows should be marked out, allowing a distance of from twelve to eighteen inches, according to the variety, and the distance between the plants in the rows should be about twelve inches. Lift carefully with a garden trowel, and plant very firmly. Do not allow the plants to droop, and should dry weather prevail damp them overhead two or three times during the day. The surface soil should be kept constantly stirred with the Dutch hoe, and receive light dustings of fresh soot weekly. After a good start has been made light applications of some approved vegetable manure will be beneficial, preferably during showery weather. Providing the land is well drained, as it should be, too much water can hardly be given during the growing season. Once a week liquid manure from the farmyard, properly diluted, should be applied. Endeavour to have the growth completed by the end of August, when the crop should be lifted and the bulbs thoroughly ripened by exposing them to the sun. Too much care can hardly be exercised in carrying out this work, as if only slightly bruised the bulbs will not keep, a fact which can hardly be too much impressed on those who have charge of them. When storing them away the bulbs should be nicely cleaned, and all loose skins removed, as well as the tops and roots. To perfect any that may be required for exhibition purposes they should be placed in boxes filled with wood wool or similar material, and placed near the glass in a cool, airy house.

Diseases and Insect Enemies.

Fortunately the onion is not susceptible to many diseases. The most common and troublesome perhaps is mildew. This must be carefully watched for, and immediately there are any signs of the mildew adopt remedial measures. Plants that are affected should be carefully pulled up and burnt, and the rest thoroughly dusted over with lime and black sulphur. The onion fly frequently does much damage to the crop when sown in the open under the old conditions, sometimes completely ruining the bed. Soot is generally recommended and may be applied with a great amount of success, providing it is used as a preventive, and not as a remedy. After the plants are once attacked nothing will save them. Soot is, moreover, an excellent stimulant, and when used with reasonable care does no damage, so that the [illegible] should be dressed immediately the seed sown or the young plants put out, and repeated weekly.

Varieties.

There are now a very large number of excellent stocks suited for producing large shapely exhibition specimens, the majority of which are of the Ailsa Craig type, which is quite the best. Stocks which have a tendency to be globular should always be preferred to flat types, not only for the sake of appearance, but for their keeping qualities also.

E. BECKETT.

Aldenham House Gardens, Elstree.

NEW PLANTS, ETC.

ODONTOGLOSSUM SPLENDENS.

A distinct and beautiful hybrid obtained from a cross effected between O. eximium and O. Wilckeanum. The flowers are comparatively large, and borne in graceful spikes, of good form, and the sepals and petals are richly coloured brownish red and purple on a cream-white ground. F.C.C., R.H.S., February 22. Messrs. Sander and Sons, St. Albans.

DENDROBIUM MRS. FENTON ARNTON.

An exquisitely beautiful hybrid, of which the parents are D. melanediscus and D. Findleyana. The flowers are of large size and elegant form, and are pale blush with rich purple blotch on the lip. A characteristic illustration appeared in our issue of February 26, but the name was wrongly given as Mrs. Fenton Horton. A.M., R.H.S., February 22. Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

ODONTOGLOSSUM EXIMIUM E. C. ROGERSON.

A handsome hybrid that had its origin in a cross between O. crispum and O. ardentissimum. The flowers are of large size and fine form, and the white sepals and petals are heavily blotched with rose-purple. A.M., R.H.S., February 22. E. Rogerson, Esq., West Didsbury, Manchester.

CATTLEYA SCHRODERÆ THE PRINCE.

A charming variety of this beautiful species, the petals and sepals are of great breadth and pale pink, and the lip light pink with deep purple blotch. A.M., R.H.S., February 22. H. S. Goodson, Esq., Fairlawn, Putney.

ODONTOGLOSSUM CERES.

A distinct hybrid, with O. Rossi and O. Rolfæ as its parents. The flowers are relatively large, the sepals and petals white tinted yellow, the petals marked with small claret-coloured blotches; the lip white, with yellow and purple markings. A.M., R.H.S., February 22. Messrs. Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM BLACK PRINCE.

An interesting hybrid, remarkable for its deep purple colouring. A.M., R.H.S., February 22. Messrs. Sander and Sons.

DISA LACERA MULTIFIDA.

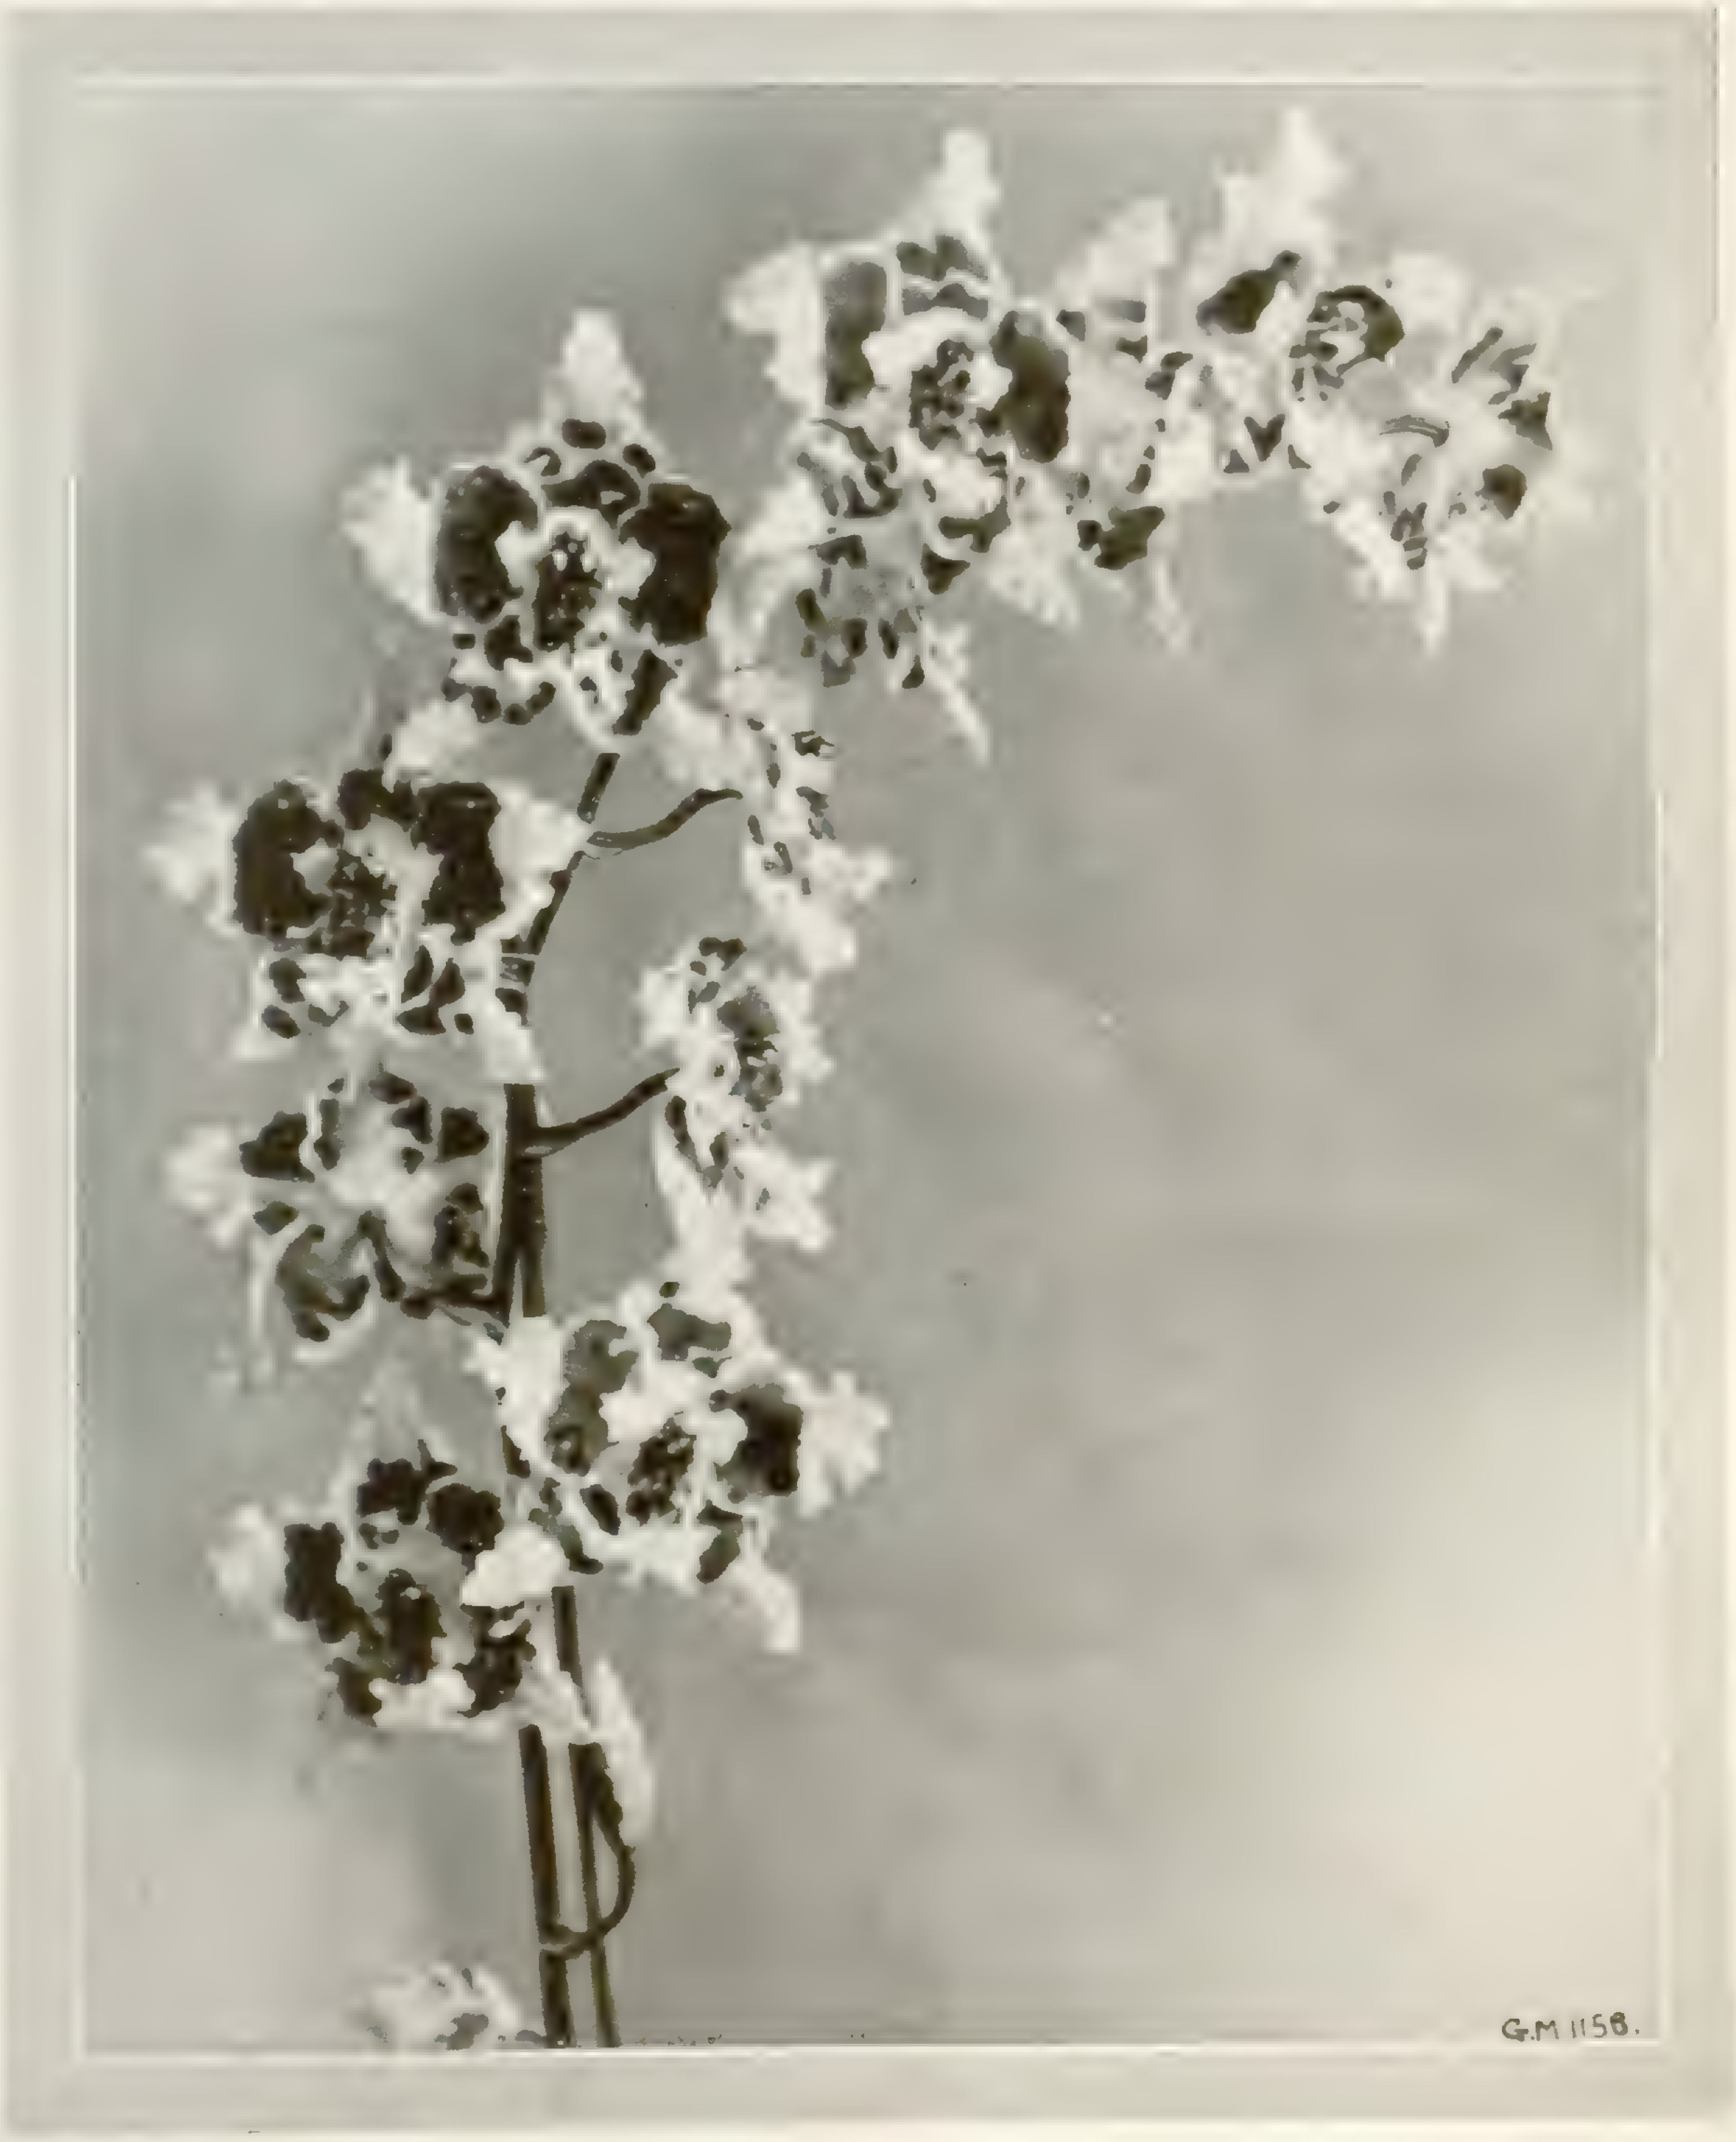
An interesting form of this species which has its home in Cape Colony. It has grass-like foliage, and medium sized blue flowers, with red fringed lip, the latter being borne on slender scapes ten or twelve inches high. A.M., R.H.S., February 22. Messrs. Charlesworth and Co.

CARNATION MRS. TATTON.

An extremely beautiful variety belonging to the Malmaison section, that has the promise of becoming highly popular both in market and private gardens. The flowers are of large size, borne on long stems, and of fine form. The colour is bright carmine-red passing to white at the margin. In the matter of colour, it resembles the well-known Marmion, but the blooms are of much finer form, and more perfect in finish. A.M., R.H.S., February 22. Mr. H. Burnett, Guernsey.

SMALL BORDERS FOR PEACHES.

I agree with Mr. Garner (p. 132) regarding the inadvisability of making borders for peach trees too large and of too rich material. Years ago it was a common custom to remove the whole of the soil about four feet deep, and as much as ten feet wide, for an inside peach border, replacing the natural soil with turf, manure, bones, charcoal, and so on. In those days close pruning also was much more in vogue than at present, and if trees made extra-strong growth, as they did, these gross growths were cut out.



ODONTOGLOSSUM EXIMIUM E. C. ROGERSON.
Flowers white blotched with rose purple. A.M., R.H.S., February 22.
E. Rogerson, Esq.

Now a much more common-sense method of treating both the borders and the trees has taken the place of that previously practised, and with much more desirable results. Nowadays, if a large established tree has to be removed to another site, and it does not give a crop of fruit the same season, much disappointment is the result. Borders for peach trees and vines are all the better for restriction: more satisfactory results are obtained because the roots are more effectually under control. How much superior is the produce from vines of Mrs. Pince grape in a restricted border, as compared with fruit obtained from vines having an unlimited root run, is a well-known fact. No one has demonstrated this better than Mr. Shingler, at Melton, not only with Mrs. Pince, but with many other varieties of grapes. It was not always so with cultivators of thirty or forty years ago.

The late Mr. Wildsmith, who probably grew out-of-door peaches at Heckfield as well as most gardeners, was a firm believer in the restricted border for his trees on a south wall. Every other year the border in front of the trees, on which grew low vegetables, strawberries, etc., was deeply trenched to within a yard or four feet of the wall, cutting off the roots that extended beyond that distance. This trenching, so persistently practised, was the cause of the fibrous nature of the roots of the peach trees, and by which the trees were enabled to carry annually such handsome crops of fruit. With restricted rooting space, ample drainage, and a greater freedom of branch extension root pruning is not nearly so much required as formerly under the opposite practice. Ample drainage is a boon, as much more benefit accrues from copious supplies of water and liquid stimulants given at the right moment than where the roots are enabled to run with impunity into a deep and heavy retentive subsoil, which cannot do other than produce growth of an undesirable character.

E. MOLYNEUX.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MILTONIAS.—Such species as M. candida, M. Clowesi, M. cuneata, M. Regnelli, and natural hybrids of this section, will now need repotting or top dressing, as the case may be. This work should be attended to before the new growths become too far advanced. It is not advisable to repot these plants annually, providing there is ample room in the pots, and the potting compost in a good state. It will suffice to remove the dead moss on the surface, and after removing any dead leaf bracts and decaying matter about the base, the plants should be examined for any scale insects about the base of the pseudo-bulbs, and be cleansed. This being done, replace the dead potting compost with chopped sphagnum moss. When the plants require more root space it is not always desirable to remove potting compost that is in good condition, for the less roots are disturbed the better. They may simply be transferred to pots of a larger size, taking care to surround the old compost retained with good free and open material, so that the air may have free passage. A compost consisting of equal parts of osmunda fibre, fibrous peat, chopped sphagnum, and broken oak leaves suits these miltonias admirably. Sufficient finely broken crocks and sand should of course be added to keep the compost porous. When potting is completed give a thorough watering with rain water, and bear in mind that all newly-potted plants should be protected from the direct rays of the sun during the hottest parts of the day, and ample moisture be maintained about them, syringing between the pots, and in bright weather a spraying overhead once or twice daily will be an advantage. When they have become established in their new compost ample light is necessary to assist them to harden their growths and aid them in the production and development of their flower scapes.

MILTONIA SPECTABILIS and its allied species M. Moreliana, deserve considerable more attention from growers than they receive at the present time. A few years ago good specimens of these were prominent at the principal summer exhibitions, but it is seldom indeed now that we see a respectable example. I have no doubt the difficulties found in inducing them to bloom satisfactorily accounts, to some extent, for their passing out of favour. They grow freely enough when treated under the same conditions as the majority of intermediate house subjects, but to obtain an abundance of flowers a Mexican house, or other structure where they have the benefit of strong light is essential. They should now have attention, and any repotting requirements attended to. Where they have had a prolonged season of rest the surface moss will have died, and this should be replaced with fresh chopped sphagnum. In repotting use shallow pans or baskets, as they do not require a great depth of potting compost. We find the compost mentioned in the preceding paragraph suits these also. A careful observation is necessary to keep the plants free from insect pests during the spring and summer months.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS. — The plants intended for the production of large blooms should now be all put into 3in. pots and kept growing slowly. They require to be strong, yet without grossness. It is advisable to look over them twice a day to ensure their having a sufficiency of water. This should be done early in the morning, and again in the afternoon, on each occasion syringing the plants gently overhead and damping the surface of the beds in the house if the weather is bright. A little air may now be admitted by the side ventilators on all favourable occasions, care being taken to prevent cold draughts. The plants should be turned round once a week to expose the growth on all sides to the sun, as this helps the wood to mature as it grows, which is essential. Strict attention must be given to keep greenfly in check. Attention to all minor points in detail is necessary, and do not use fire heat if a temperature equal to 45 deg. can be maintained at night without it.

LILIUM HARRISII.—The earliest bulbs of this lily may now be put into a warmer house, being careful to select only those which have a fair amount of roots, and are already developing foliage. If space has been allowed for top-dressing, this operation may be delayed until growth is more vigorous. Place a stake to each growth, and tie them up neatly.

FUCHSIAS that have rested through the winter months should now be turned out of their pots and cleared of all exhausted soil. Repot, and use good turfy loam, leaf-soil, and sand, with a moderate quantity of charcoal, syringing overhead morning and evening to encourage growth, but water sparingly for a week or two till root action commences.

FRANCOA RAMOSA.—Seeds of this elegant subject should be sown now. Those in 6in. pots will derive benefit from a shift into 8in. pots. Grow them on in a cool house for a time, then transfer to a frame.

CANTERBURY BELLS.—Plants that have wintered in frames should be shifted into the greenhouse. Canterbury bells make fine subjects for early flowering, and should have liquid manure given them twice a week.

HUMEA ELEGANS occupying 6in. pots should now be shifted into those 9in. in diameter, and be kept growing slowly in a cool house. Careful watering is essential to success.

LIBONIAS.—These should be cut back and the tops be utilised in the raising of young stock. The old plants may be shaken from the pots, the ball reduced, and be repotted. Those exceeding two years old should be thrown away.—W. Staward, Belford Hall Gardens, Belford, Northumberland.

THE FLOWER GARDEN.

GLADIOLI will, in warm sandy soils, winter safely if left in the ground in suitable localities. This practice is sometimes followed, but it is safer generally, and, on the whole, more satisfactory, to annually lift, and store the corms during the winter months, planting the strongest afresh the following spring. Where special borders are not set apart for these, vacant spaces in the herbaceous borders might be utilised, and if arranged in clumps of six or eight the brightness of the borders will be maintained after many of the herbaceous subjects have ceased flowering. In heavy soils a good layer of sand or sharp road grit should be placed under each corm, and, if possible, the bulbs covered with properly prepared light rich soil. This will greatly promote the production of cleaner and stronger sheaths and flower spikes.

TUBEROUS BEGONIAS required for bedding should now be examined. The season of 1909 was not at all favourable for the proper ripening of the growths or tubers, consequently the losses have been more numerous than usual. The tubers should be started in an intermediate temperature of not more than 60 degrees, or the resulting growths will be weak for the remainder of the season. An excellent way of increasing at this time of the year is by dividing up the tubers, allowing one or more growths to each portion. Sever with a sharp knife, and sprinkle a little powdered charcoal and sulphur over each newly-made cut. Put them singly in suitable sized pots, and replace in a similar temperature to that in which they had formerly been growing. No water need be given for a few days, but a sprinkling overhead on bright days will assist growth.

CANNAS required for sub-tropical beds will likewise require attention similar to that advised for begonias. Unlike the tuberous begonias, the stools are in excellent condition, although stored in a similar way, and the crowns are plump and strong. Many of these will require shifting on into larger-sized pots as the plants increase in size and the season advances, for on no account must they be given starvation treatment before being planted out in May or June. If the pots are overcrowded with roots, and the growth becomes weak before the planting season, no matter how favourable the summer, the plants will not recover. Arranged in masses in beds they give a very bold effect, but if grouped about the lawn, or in suitable places, of seven, nine, or eleven plants, with a grass space between each one, the resulting effect is very pleasing, and a change from the usual orthodox method of arrangement.

GENERAL WORK on the lawns and other spaces will be the completion of turfing, or similar work that has been delayed by the long spell of unfavourable weather. Edgings and verges of turf should be trimmed, and the planting of all deciduous subjects brought to a speedy close. Evergreen shrubs may be safely removed for some time to come, but all needed preparations for these should be made without delay. Laurels and hollies that are bare at the base might be headed back to the required height, or needless straggling growths removed.—W. Hedley Warren, Aston Clinton Gardens, Tring.

HARDY FRUITS.

AUTUMNAL RASPBERRIES.—All canes of these particular varieties should be cut off close to the ground early this month, and later on strict attention should be paid to thinning the resulting summer canes, which will commence to produce fruit from September onwards. Two excellent varieties to grow are German Everbearing and November Abundance. The Alexandra, a new variety, should be given a trial, the large fruits being of excellent flavour.

PLANTING.—The planting of all kinds of fruit trees should be completed without delay. The weather has been most trying for carrying out this work in a satisfactory manner. It has been possible to plant in sandy soils, but in soils of a heavy retentive character it has been quite out of the question. Where land of a heavy nature has to be dealt with it will be found advisable, and more advantageous, to defer planting until next autumn.

COB NUTS AND FILBERTS.—These should be planted in a soil that is well drained; they will succeed, and give good returns when planted in stony ground, and in rough poor soil. Shelter should be provided, such as that of adjacent trees or tall-growing shrubs, as they are subject to injury by frosts when in flower. The trees should be planted ten feet apart, and should be kept in their limit by pruning, or otherwise they will shade each other. The trees should be grown to a single stem, and all suckers removed as soon as they appear. established trees which bear heavy crops annually will be benefited with a good coating of decayed manure, or decayed leaves. The buds of nuts are attacked by a mite very similar to that of the black currant, and the same preventive precautions should be adopted.

BIRDS.—The bullfinch and sparrow are the most serious enemies to the fruit grower by destroying the buds; they are especially fond of the buds of the gooseberry and pear, and once they commence their work of destruction upon the buds of fruit trees it is a serious matter to combat them. Where possible, all soft fruit should be netted, and the birds trapped or shot. It is a good plan to syringe the trees with a wash made from lime and soot, with a little soft soap added, or the trees can be dusted over with equal quantities of lime and soot after a shower of rain. This renders the buds distasteful to the birds for a time, but it will be found necessary to repeat the operation several times if they continue to be troublesome.—Henry R. Farmer, Cardiff Castle Gardens.

ACTION AND MOVEMENTS OF WATER IN SOIL.

(Concluded from page 182.)

Surface Evaporation.

That the distribution of water in the soil changes rapidly at times, so that one layer has gained moisture at the expense of a contiguous layer, has been demonstrated in the following manner. Two cylinders were filled with a mixture of sand and humus in the proportions of 80 parts of the former to 20 parts of the latter. The samples were then properly saturated with water, and allowed to stand for two days. At the end of the second day the surface of both samples were stirred to a depth of one inch, and again allowed to stand. In two days from the time of stirring the surface one of the samples was firmly packed, the firming was done in the evening, and on the following morning the surface of the packed soil showed unmistakable signs of moisture. This is simply an example of what occurs when land is trodden or rolled. The increase of moisture towards the top, which follows soon after rolling, results from increasing the strength of capillary action by bringing the soil particles in the firmed layer closer together, and, as a result, more water is brought up from below, which leaves the lower layer drier. It must not, however, be understood that rolling moistens the ground as a whole, for it does just the reverse. Experiments have shown that more water is lost from rolled than unrolled soil. The reason of this is that the surface soil of rolled land is warmer and the velocity of the wind is not checked by lumps or other unevenness of surface. It is, therefore, good practice to follow the treading or roller with a rake or light harrow, which creates a sort of mulch, and thus lessens the amount of water lost by evaporation. At the same time, the previous firming of the loose soil increases the upward movement of the soil water, and thus brings the much-needed moisture to the roots of the plants.

It has been observed that after a shower the soil at some distance below the surface becomes actually drier. Professor King, in his valuable book, "The Soil," says: "The capillary flow of water may be so strengthened by a shower that the surface soil draws upon the deeper soil moisture at a more rapid rate than before, causing a translocation of the lower soil moisture, the lower soil becoming measurably drier." To obtain definite data on this point, we planned a series of experiments, in which three glass tubes, each twelve inches long, and three-quarters of an inch inside diameter, were used. These were filled with soil obtained from the experimental field. The soil was not dried before transferring it to the tubes. After this had been done a weighed quantity of water was sprinkled over the surface of the soil in the tubes. Six hours after adding this water samples of the soil were again taken, and in every case it was found that the surface five inches contained from 1.8 to 2.5 per cent. more moisture than could be accounted for by the addition of the water to the surface, while the lower five inches had lost a corresponding amount of water.

These observations may be explained in the following manner: When the surface soil has reached a certain degree of dryness, water ceases to rise in it rapidly from below, as shown in the experiments on capillarity. Then when a shower comes, or, as in this case, water is added in sufficient quantities to moisten the dry soil up to a point at which capillary action becomes strong again, an additional amount of water is brought from the moist soil below. So that the surface layer has not only the amount which fell as rain, but an additional amount of moisture drawn from the subsoil.

A very important practical lesson can be gathered from these facts. Suppose a hot, drying wind should follow the shower which has produced this translocation just described, the ground might in a few hours be left drier as a whole than before the rain. Because, not only the rain, but moisture from the subsoil, which is caused to be brought to the surface might be lost. On the other hand, if the soil is stirred at the surface as soon after the shower as may be without injury to tilth, most of the water which fell as rain, and that lifted from the lower layers, will be preserved for the use of the crop. On no account, however, should the stirring be done when the soil is too wet, as puddling, and subsequent baking, are likely to follow as a result of such an operation.

ORCHARD HEATING IN COLORADO.

The 1909 crop of fruit in the Grand valley in Colorado, from the Palisades above to Loma below, valued at $3,000,000 (one dollar equals 4s. 2d.) owes its existence to a unique battle which was waged against Jack Frost at a time when the fruit was at its tenderest age. By unusual generalship and the work of hundreds of enthusiastic volunteers, the temperature in these orchards was actually raised eight and nine degrees over twenty-seven miles of territory, and a precedent was established which will mean much to the future. In California it is said that the temperature has been raised heretofore in some single orchards two or three degrees, but never to eight degrees, and never before has the work been carried on over so great an area. Plans are now on foot to have every bearing orchard in the Grand valley protected by next season; not that there is any likelihood of frost every spring in this section, but because the protection against possible repetition of this year's experience is considered cheap insurance. Representatives of other fruit-growing sections have also recently visited the Grand valley, sent there from their several communities to learn more of the recent experiment.

The raising of the temperature over this large area was accomplished by means of some 300,000 smudge pots of many different types, some burning oil for fuel and some coal, and placed at intervals in the orchards. Oil was carried to the pots in wagon tanks equipped for the purpose. Spraying machines were also used in distributing the oil. A large supply of lighters was kept in readiness in a dry place. Many of these lighters were made by wrapping waste about a twisted wire.

All operations were directed from Grand Junction. Weather stations established over much of the territory, and equipped with thermostats, when the threatening weather arrived, made half-hourly reports on the temperature to Grand Junction. When finally the danger point was approaching, warning was sent to all the ranchmen to light the fires. Volunteers also in nearly all walks of life made their way in automobiles and wagons and on bicycles over the entire area. The trades and labour assembly adjourned its meeting, and worked all night rendering assistance. Men worked in shifts, some at night lighting the fires, and others in the daytime filling the pots. Even women assisted in the work. The campaign in all lasted four days.

So well did this orchard-heating idea work, that while the temperature outside the heated area dropped as low as 20 deg., within the heated area it did not go below 29½ deg. Seventy-five per cent. of all the fruit trees which were in bloom were cared for directly, while even orchards owned by those who were sceptical of the idea were saved by the fires in the adjoining territory.

There were a great many different kinds of pots used in this work. The number used per acre depends upon the size. Forty, sixty, or eighty pots per acre was the average. When coal is used, it is usually lump or nut. With coal at $4 a ton, some one has figured that it cost him $4 per acre to heat his orchard for a six-hour run. Some of the oil heaters are used to the number of sixty or eighty to the acre. In the opinion of some, it is better to have a small-sized pot and use more to the acre, say sixty or eighty, as just stated.

Taking one of the many kinds of pots as an example and figuring coal at $4 a ton, the cost of equipping with heaters and all other facilities for the first year for ten acres is estimated at $449.25, and for the second year $186.25. This provides in the initial cost for 800 heaters, or eighty to the acre. It also provides for forty tons of coal, kindling lighters, fifty pounds of waste, 200 gallons of oil for lighting, the storage for oil, and the building of a coal house. For the first year's equipment for oil pots, including 800 pots for ten acres, and fuel at five cents a gallon, the cost is estimated at $494.25, and for the second year $153.75.

Now that the question of raising the temperature even ten or fifteen degrees over a large area has been settled beyond doubt, the next problem facing the fruit growers is that of regulating the temperature and economy of fuel and labour. For example, there is no need of raising the temperature ten degrees when raising it two degrees will put the blossoms out of danger. Some are planning to meet this problem by having a large number of small pots and only light enough of them to keep the temperature above the danger point. Others have devised pots with a system of drafts, so that the heat may be increased or decreased as is necessary.

The fruit ranches of the Grand valley are very extensive. One, for example, contains 243 acres, and is valued at $250,000. Its crops include peaches, apples, pears, plums, cherries, and soft-shell almonds. An army of people is required to pick the fruit. By another season it is expected electric lines will be running out to the orchards all over the valley, and refrigerator cars will be carried right to the orchards. — "Scientific American."

Horticultural Club.—The next house dinner of the Horticultural Club will take place on Tuesday next at the Hotel Windsor, when Mr. C. Bogue Luffmann will give a lecture on "Old Age in Trees." The dinner will, as usual, commence at 6 p.m.

Peter Barr Memorial.—As already announced a fund is being raised for the purpose of providing a suitable memorial to the late Mr. Peter Barr, V.M.H. The promoters aim at a Barr Medal, to be awarded annually in connection with work among daffodils, and the maintenance of an orphan through the medium of the Royal Gardeners' Orphan Fund. The following is the preliminary list of subscribers: Mr. J. G. Baker, F.R.S., V.M.H., Messrs. Barr and Sons, Mr. J. T. Bennett-Poë, V.M.H., Mr. E. D. Bland, Mr. C. Bourne, Mr. E. A. Bowles, Hon. J. Boscawen, Mr. F. H. Chapman, Mr. E. T. Cook, Mr. W. B. Cranfield, Mr. E. M. Crosfield, Mr. Charles H. Curtis, Rev. C. T. Digby, Mr. C. Dixon, Miss Roberta F. M. Doyne, Mrs. J. Douglas, Mr. J. Douglas, V.M.H., Mr. C. T. Druery, V.M.H., Rev. G. H. Engleheart, V.M.H., Mr. J. Harrison, Miss Jekyll, V.M.H., Rev. J. Jacob, Mr. A. Kingsmill, Mr. Wm. Marshall, V.M.H., Mr. H. B. May, Mr. D. MacDonald, Mr. W. A. Milner, Mr. S. Mortimer, Messrs. J. and R. Pearson and Sons, Mr. R. Hooper Pearson, Mr. G. Paul, V.M.H., Mr. W. Poupart, Messrs. T. Rivers and Sons, Mr. Charles E. Shea, Messrs. Sutton and Sons, Mr. J. Sweet, Mr. Robert Sydenham, Mr. Harry J. Veitch, V.M.H., Mr. P. C. M. Veitch, Mr. James Walker, Messrs. Van Waveren and Sons, Miss Willmott, V.M.H., Rev. W. Wilks, and Mr. A. M. Wilson.

NATIONAL SWEET PEA SOCIETY.

The TENTH EXHIBITION will be held at ROYAL HORTICULTURAL HALL, July 12th and 13th.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, February 22.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Dr. A. B. Rendle, F.R.S., Dr. J. A. Voelcker, M.A., F.I.C., Messrs. A. Worsley, J. W. Odell, A. D. Michael, G. Gordon, V.M.H., W. Fawcett, J. Douglas, V.M.H., J. Fraser, L. Crawshay, W. Hales, J. T. Bennett-Poë, V.M.H., F. J. Baker, E. M. Holmes, R. H. Curtis, H. J. Veitch, V.M.H., and F. J. Chittenden (hon. secretary).

AZALEA GALL. — Mr. L. Crawshay showed a specimen of the gall on Azalea indica caused by Exobasidium japonicum. (See "Journal, R.H.S.," xxxiv. (1908), p. 45.) Several examples of this gall have been received lately, and the disease would appear to be spreading. The galls should be picked off and burned as soon as discovered.

CYCLAMEN COUM.—Messrs. Jackman sent a pan of Cyclamen coum album multipetalum, a form differing from the type in having seven or eight petals instead of five, so that the flower appeared much rounder than usual.

ACACIA DEALBATA.—Mr. Worsley remarked that he had noticed in Portugal two forms of this plant, one having a smooth bark somewhat silvery in colour, the other rough. There seems to be no record of these variations, and the flowers shown exhibited no marked variation.

ALLEGED RUST-PREVENTING WOOD.—Dr. Voelcker enquired whether any member could give any information concerning a Formosan wood which he exhibited, called in the vernacular "Sianlam," which it was alleged, had the peculiar property of preventing the rusting of iron and steel. Dr. Henry had informed him that he had come across a wood in Formosa under that vernacular name, which belonged to Macilus Thunbergi. Shavings of this wood were steeped in water so as to extract a gummy secretion, which Chinese ladies used for dressing their hair, but he had never heard rust-preventing powers ascribed to the wood. Mr. Holmes took the specimen shown in order to examine it further. Dr. Voelcker also made some remarks upon variation in primroses, said to be correlated with different soils. The committee desired to see specimens if possible.

LICHENS ON AZALEA MOLLIS.—An enquiry re the destruction of lichens (Parmelia physodes) on Azalea mollis was received from Fleet, Hants. It was recommended that the plants should be sprayed with a solution of copper sulphate (1lb.) in water (25 gallons), while the plants were leafless.

MALFORMATION OF PRIMULA SINENSIS.—Mr. L. Crawshay reported that he had examined the specimen of P. sinensis (stellata) shown at the last meeting, and found at the base of the umbel two green bodies which appeared to be very greatly reduced and aborted inflorescences. The linear segments which formed part of these abortions probably represented perianth pieces, the terminal knob on each possibly representing the epipetalous stamen. At the base of these segments, arranged indefinitely owing to the distortion of the placenta, were numerous sessile bodies, probably representing ovules. Mr. Crawshay showed drawings in illustration of his report.

MALFORMED CYPRIPEDIUM.—From Lord Avebury, P.C., came specimens of Cypripedium barbatum malformed. One flower showed the anterior sepals completely divided. They were referred to Mr. Crawshay for examination.

The Horticultural Club.

The annual dinner of this club was held at the Hotel Windsor on Tuesday, the 22nd ult., under the presidency of Sir John Llewelyn, Bart., about a hundred members and guests being present, including a number of ladies.

Prior to the dinner the annual meeting of the club members was held, and a very satisfactory report of the club's progress was given, indicating a material increase in the membership, and a financial position which left nothing to be desired. A particular feature of the report was the interesting and educational character of the lectures which had followed the various monthly dinners during the season, and had now been a principal factor for many years in providing subjects for discussion among the experts present, to the material benefit of all concerned, the club, in this way, combining utility with sociability on the best possible lines.

Thanks to the kindness of Messrs. J. Veitch and Sons, the tables were beautifully decorated with flowers, a special group of rhododendrons figuring in front of the president as a graceful tribute to the special hobby in that connection, in which he has made a decided mark as collector and raiser. The inevitable speeches were interspersed with an admirable entertainment, humorous and musical, which was much appreciated. Mr. W. J. Jefferies, in a brief and happy speech, proposed the toast of the Royal Horticultural Society, to which Sir Albert Rollit responded in his usual telling and humorous fashion, provoking much hilarity by the anecdotes, intermingled with apt remarks on the importance of the society, and its value to the world as a central institution on the largest and best based foundation of all existing ones. References were made to the proposed great international horticultural gathering of 1912, and the hospitality which will then be extended to our foreign guests. Sir John Llewelyn then proposed "The Horticultural Club," dwelling on its value as forming the social centre of the Royal Horticultural Society, and the Rev. Joseph Jacobs responded. Mr. George Monro proposed the chairman's health, which was drunk with all honours. Mr. Edward White welcomed the visitors in the name of the club, and Mr. Smith, a Canadian guest, happily responded, thus concluding one of the most pleasant and most successful functions in the annals of the club.

Gardeners' Royal Benevolent Institution.

The annual concert, held under the auspices of the Liverpool Auxiliary, took place at the Bear's Paw Restaurant on Saturday last, and added another to the successful evenings in aid of the funds of the institution. Alderman F. Smith, J.P., presided over a crowded and delighted meeting. The committee spared no effort in making the meeting attractive by providing an excellent programme, and brightening the hall with plants and flowers. In the production of the floral display they were ably assisted by Messrs. R. P. Ker and Sons, Messrs. B. Webb and Sons, Mr. C. A. Young, and members of the committee.

In the Chairman's address he emphasised the good work that is being done by the institution, and he hoped, by their further effort, the work might still be increased. He referred at some length to the efforts the Corporation of Liverpool are making in developing a taste for flowers by their exhibitions, window boxes, and plants in tubs. With reference to the employees engaged in the parks and gardens, he said he was in favour of payment being made according to skill; he considered the efficient and trained man was worthier of a higher scale of pay than the beginner or raw workman. He further expressed his sympathy with many of the poorly paid private gardeners. On the motion of Mr. C. A. Young chairman of committee, seconded by Mr. J. J. Guttridge, superintendent of Liverpool parks and gardens, a hearty vote of thanks was tendered to the chairman, and this, on being put to the meeting, was carried with acclamation.

Reading Gardeners' Association.

There was again a very large attendance at the fortnightly meeting held in the Abbey Hall, on Monday, February 21, the president, Mr. Alderman Parfitt, occupying the chair. The minutes of the last meeting having been read and confirmed, several new members were elected. The Hon. Secretary mentioned that a sad case, the almost simultaneous death at Chertsey of a gardener and his wife, leaving a family of six young children, had been brought to his notice by a member of the society. Although the case was outside the radius of the association, a collection was taken in the hall, resulting in £2 14s. being sent to the assistance of the children.

The President then introduced the lecturer for the evening, Mr. John W. Tayleur, B.Sc., of the University College, Reading, his subject being "The Nature and Uses of Manures." Mr. Tayleur, in a very interesting discourse, gave most instructive details of the complex subject of manures, his remarks being most lucidly placed before the audience, and rendered, if possible, more clear by the excellent diagrams, etc., wherewith he illustrated his lecture. [illegible] first with the essential elements w[illegible] which plant life cannot exist, Mr. Tayleur passed to the classes of artificial manures generally recognised, viz., nitrogenous, phosphatic, potash manures, and calcareous, referring afterwards to the several examples which occur under these headings, and giving full particulars concerning different qualities and uses of the various manures.

Advice was also given to those desirous of making their own mixtures so that the best results might be obtained at the smallest outlay.

At the conclusion of his lecture Mr. Tayleur was, on the proposition of the President, accorded a very hearty vote of thanks.

Mr. H. C. Loader, head gardener to M. H. F. Sutton, Esq., Erlegh Park, exhibited a nice group of lachenalias, etc., and Mr. W. Barnes, The Gardens, Bear Wood, staged some beautiful forced rhubarb, seakale, and salads.

British Gardeners' Association (London Branch).

At the last meeting of the London branch of the B.G.A. the question of a dust-proof carriage drive formed the subject of an interesting discussion. One member suggested that, in view of the increase of motor traffic, wood blocks would prove the most serviceable; this would give a smooth, durable surface, and one that could be easily kept clean. Up to the present gas tar was considered to have proved the most satisfactory material. Where this is used it is essential that a good hard-wearing surface should be first secured, such as may be obtained by a good layer of granite consolidated by a steam roller. The surface is then flooded with boiling tar, and afterwards sprinkled over with sand. The great objection to the use of tar in a public park is its unnatural appearance, and the possibility of injury to neighbouring vegetation.

The next meeting will take place at Carr's Restaurant on Thursday, March 10, at eight p.m., when an address will be given by Mr. W. S. Palmer, of Finsbury Park, on "Trees and Shrubs." The following question has also been submitted for discussion at this meeting: "Assuming that all plants owe their origin to one common ancestral stock, how can we account for two such distinct classes of plants as the monocotyledons and the dicotyledons?"

Bristol Gardeners' Association.

A largely-attended meeting was held on February 24, at St. John's Parish Rooms, presided over by Mr. Hayball. A lantern lecture upon "Lawns and Lawn Grasses," was given by Mr. Shipway, representative of the Reading Gardeners' Association. Mr. Hanking very ably manipulated the lantern. Mr. Shipman dealt with the formation of lawns, drainage, levelling, surface preparation, turfing v. seeding, differences of lawns, sowing, varieties of grasses, upkeep of lawns, manures, thin turf, weedy turf, mossy turf, earth worms, fairy rings, lawn implements. It was interesting to learn there are nearly 2,000 varieties of grasses, also that whereas seeding only cost from £10 to £15 per acre, turfing cost £100. The slides shown on the screen included views of the lawns at Oxford College, also of several well-known places, varied with views of golf courses, tennis and croquet lawns, cricket pitches, bowling greens, and archery grounds.

For two orchids Mr. Curtis was first and Mr. Gostling second. For spray and button holes, under gardeners only, Messrs. Whiting, Newman, and Isaac were placed in the order named. In the point competition Mr. Gostling was given three points, and Messrs. Curtis and Woodward two each for orchids. Mr. Shipway was awarded a special certificate for a collection of dried weeds, the same going to Messrs. Garaway for a new red cineraria named Matador.

Dutch Bulb Growers' Society.

The following awards were made at the recent meeting of the Tulip Committee at Haarlem:—

Award of Merit to single early tulip, La Discretion, a seedling variety, cherry colour, with broad white border; single early tulip, Golden Horn, a new variety obtained from Tulip Rosamundi Huikman, flowers light yellow and rose, a splendid forcing variety; and to Darwin Tulip William Copland, an early flowering and good forcing variety.

FORTHCOMING ENGAGEMENTS.

SATURDAY, March 5.—French Horticultural Society of London.

TUESDAY, March 8.—Royal Horticultural Society's Spring Bulb Show (two days); Committees meet at 12 o'clock; lecture at 3 p.m. on "Plant Hygiene," by Mr. F. J. Baker.

WEDNESDAY, March 9.—Continuation of the Royal Horticultural Society's Bulb Show.

Royal Society of Arts Meeting.

East Anglian Horticultural Society.

THURSDAY, March 10.—British Gardeners' Association, London Branch.

MONDAY, March 14.—United Horticultural Benefit and Provident Society; Annual Meeting at the Royal Horticultural Hall, at 8 p.m.

WEDNESDAY, March 16.—Royal Society of Arts Meeting.

THURSDAY, March 17.—Torquay Spring Show.

Linnean Society Meeting.

TUESDAY, March 22.—Royal Horticultural Society; Narcissus Committee at 11.30; Fruit, Floral, and Orchid Committees at 12 o'clock; Masters' Lecture at 3 p.m. on "The Adaption of the Plant to the Soil," by Mr. A. D. Hall, M.A., F.R.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, March 23.—Stour Valley Gardening Society's Exhibition of Vegetables at the Royal Horticultural Hall.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

VARIEGATED CHRYSANTHEMUM. — T. M., Halesowen: We have often seen variegated leaves on chrysanthemums, but we do not remember a plant so finely variegated as the one you appear to have. The leaves are quite handsome, and you should certainly propagate a small stock of plants, and, if possible, exhibit good specimens at exhibitions next autumn. Try a few as summer bedding plants, keeping the growths pinched. If the variegation improves with brighter weather, the variety may be specially useful for summer and autumn effects. Most probably the flowers will not be particularly effective, but a few plants should be grown in bush form for flowering in November and December, so that a good idea of the value of the variety as a flowering plant may be estimated. Do not give away any of the stock.

WISTARIA SEEDS.—J. W. L., Bishopsteignton: It is by no means exceptional to find the wistaria seeding in the South of England, but really fine, well-ripened seeds like those sent are not often seen. We have seen a wistaria growing practically in London carrying its pods of seeds, but we do not remember whether the seeds have ever ripened in this instance.

STOCKS.—J. S., Carnforth: We are giving the matter attention, and you will receive a reply in due course.

MOWRA MEAL.—A. F., Kent: We are glad to have been of service to you, and to receive your letter.

THORN HEDGE BARE AT BASE.—S. E. G., Wexford: It would serve no useful purpose to plant young thorns close up to the base of the old hedge; indeed it would be a great waste of time and money. The "laying" of a hedge is special work, and any amount of description would hardly enlighten you. It means bringing the upper parts of the hedge down to the base, bending and partially cutting the leading stems, and tying them in with tar string or wire in the case of old plants, and doing this in such a way that, when finished, the hedge presents a neat appearance, and is well filled with growth from top to bottom. As soon as new growth commences, the whole of the hedge will then become a mass of greenery, instead of being bare and brown at the base. The best advice we can give is that you obtain the services of a local "hedger," and let him contract for the work of making your hedge useful and presentable.

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

EFFECTIVE, PRACTICAL CONSERVATORIES.

Ladies and Gentlemen waited upon by appointment

HEATING APPARATUS installed by experienced workmen in Horticultural, Public, and Private Buildings.

No. 47A.—Lean-to, 10ft. by 7ft. £9 10 0
These Houses are sent out well made, painted three coats, Glazed 21oz. glass, and Carriage Paid.

CARRIAGE PAID on orders of 40/- value to most Goods Stations in England.

HANDY DICTIONARY OF GARDENING.—A. J. W., Tenterden: We can heartily recommend the "Encyclopædia of Gardening" as the handiest work of the kind we know, and as useful as it is handy. The price is 3s. 6d., and it can be obtained from Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.

RED CINERARIA.—A. G., Boston Spa: The specimen shows a very bright and distinct colouring, and seeds of it should be saved and sown. There is room for a great deal of selection, because the flowers sent were of poor quality. The plant should have been isolated, and the seedlings resulting from it should be very carefully selected, saving only the best in form and colour for seed purposes. We have seen a brighter variety than yours, practically a scarlet; it was exhibited at the great exhibition at Ghent in 1908 by Messrs. Vilmorin and Co., of Paris, and is now obtainable through the leading seedsmen who advertise in our columns.

PRESIDENTS OF THE R.H.S. — S. W. W., Liverpool: The first president of the Royal Horticultural Society was the Earl of Dartmouth, who held office from 1804 to 1811; he was followed in order by Thos. Andrew Knight, 1811-1838; Duke of Devonshire, 1838-1858; H.R.H. the Prince Consort, 1858-1861; Duke of Buccleuch, 1862-1873; Lord Bury, 1873-1874; Lord Aberdare, 1874-1885; and Sir Trevor Lawrence, Bart., V.M.H., who has been president since 1885.

NAMES OF PLANTS.

T. B. P.—A Stanhopea, probably S. eburnea.

J. R., Croydon.—1, Pteris longifolia; 2, a pteris, not recognised; 3, Adiantum formosum; 4, Gymnogramma calomelanos; 5, Adiantum cuneatum grandiceps.

M. P., Cromer.—1, Erica mediterranea; 2, Crocus Sieberi; 3, Chorozema Chandleri; 4, Lachenalia Nelsoni; 5, Dendrobium nobile.

W. T., Lampeter.—The odontoglossums are varieties of O. crispum, neither are of special merit or value; 3, Pellæa cordata; 4, not recognised, send again later; 5, Nephrolepis exaltata.

J. H., Forest Row.—1, Rhododendron dauricum; 2, Pieris floribunda; 3, not recognised; 4, Acacia dealbata; 5, probably Rhynchospermum jasminoides; 6, not recognised. The specimens were all very poor ones.

OBITUARY.

MRS. ROBERT LINDSAY.

We learn with regret of the death of Mrs. Lindsay, wife of Mr. Robert Lindsay, who for many years was curator of the Royal Botanic Gardens, Edinburgh, and now resides at Kaimes Lodge, Murrayfield, Midlothian. Mrs. Lindsay had not been in the best of health for some time past, but the news of her death will come as a shock to many who have visited Kaimes Lodge and enjoyed the company of Mr. and Mrs. Lindsay. These will join with us in sympathising with Mr. Lindsay in his loss. Mrs. Lindsay died on the morning of February 20.

MR. DUGALD McCORQUODALE.

We much regret having to announce the death of Mr. Dugald McCorquodale, London director of Messrs. Mackenzie and Moncur, Lim., the prominent hothouse builders. He died on Saturday, February 26, after a prolonged illness. Mr. McCorquodale was a Fellow of the Royal Horticultural Society of London, and was well known and respected by the large number of horticulturists whom he daily came in contact with, principally in London and the South. He was a Scotsman of outstanding character, a native of Argyleshire, and a well-known figure at all the leading flower shows and horticultural gatherings. He leaves a widow and two daughters.

THOMSON'S CELEBRATED MANURES.
For full advertisement see page 218.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Chief Office: HOLBORN BARS, LONDON.

INVESTED FUNDS EXCEED £74,000,000.

SUMMARY of the REPORT presented at the SIXTY-FIRST ANNUAL MEETING, held on 3rd March, 1910.

ORDINARY BRANCH.—The number of policies issued during the year was **76,087,** assuring the sum of **£7,044,603,** and producing a new annual premium income of **£415,015.** The premiums received during the year were **£4,710,107,** being an increase of **£93,770** over the year 1908. The claims of the year amounted to **£3,018,981.** The number of deaths was **8,375,** and **17,629** endowment assurances matured.

The number of policies in force at the end of the year was **882,804.**

INDUSTRIAL BRANCH.—The premiums received during the year were **£7,171,770,** being an increase of **£246,015.** The claims of the year amounted to **£2,877,978,** including **£176,401** bonus additions. The number of claims and surrenders, including **4,545** endowment assurances matured, was **382,233.** The number of free policies granted during the year to those policyholders of five years' standing and upwards, who desired to discontinue their payments, was **151,865,** the number in force being **1,506,408.** The number of free policies which became claims during the year was **41,386.**

The total number of policies in force at the end of the year was **18,375,229;** their average duration exceeds eleven and a half years.

The assets of the company, in both branches, as shown in the balance-sheet, after deducting the amount written off securities, are **£74,201,701,** being an increase of **£2,242,842** over those of 1908.

The Directors are pleased to announce an increase in the rate of bonus of both Branches of the Company as follows:—

In the Ordinary Branch a reversionary bonus at the rate of **£1 14s.** per cent. on the original sums assured has been added to all classes of participating policies issued since the year 1876. This is an increase of two shillings per cent. over the rate declared for the past three years.

In the Industrial Branch all policies of over five years' duration which become claims either by death or maturity of endowment from the 4th of March, 1910, to the 2nd of March, 1911, both dates inclusive, will participate. This bonus will be paid by way of addition to the sums assured of:—

£5 per cent. on all policies becoming claims upon which at least five but less than ten years' premiums have been paid.

£10 per cent. on all policies becoming claims upon which at least ten but less than fifteen years' premiums have been paid, and

£15 per cent. on all policies becoming claims upon which at least fifteen years' premiums have been paid.

Messrs. Deloitte, Plender, Griffiths and Co. have examined the securities, and their certificate is appended to the balance-sheets.

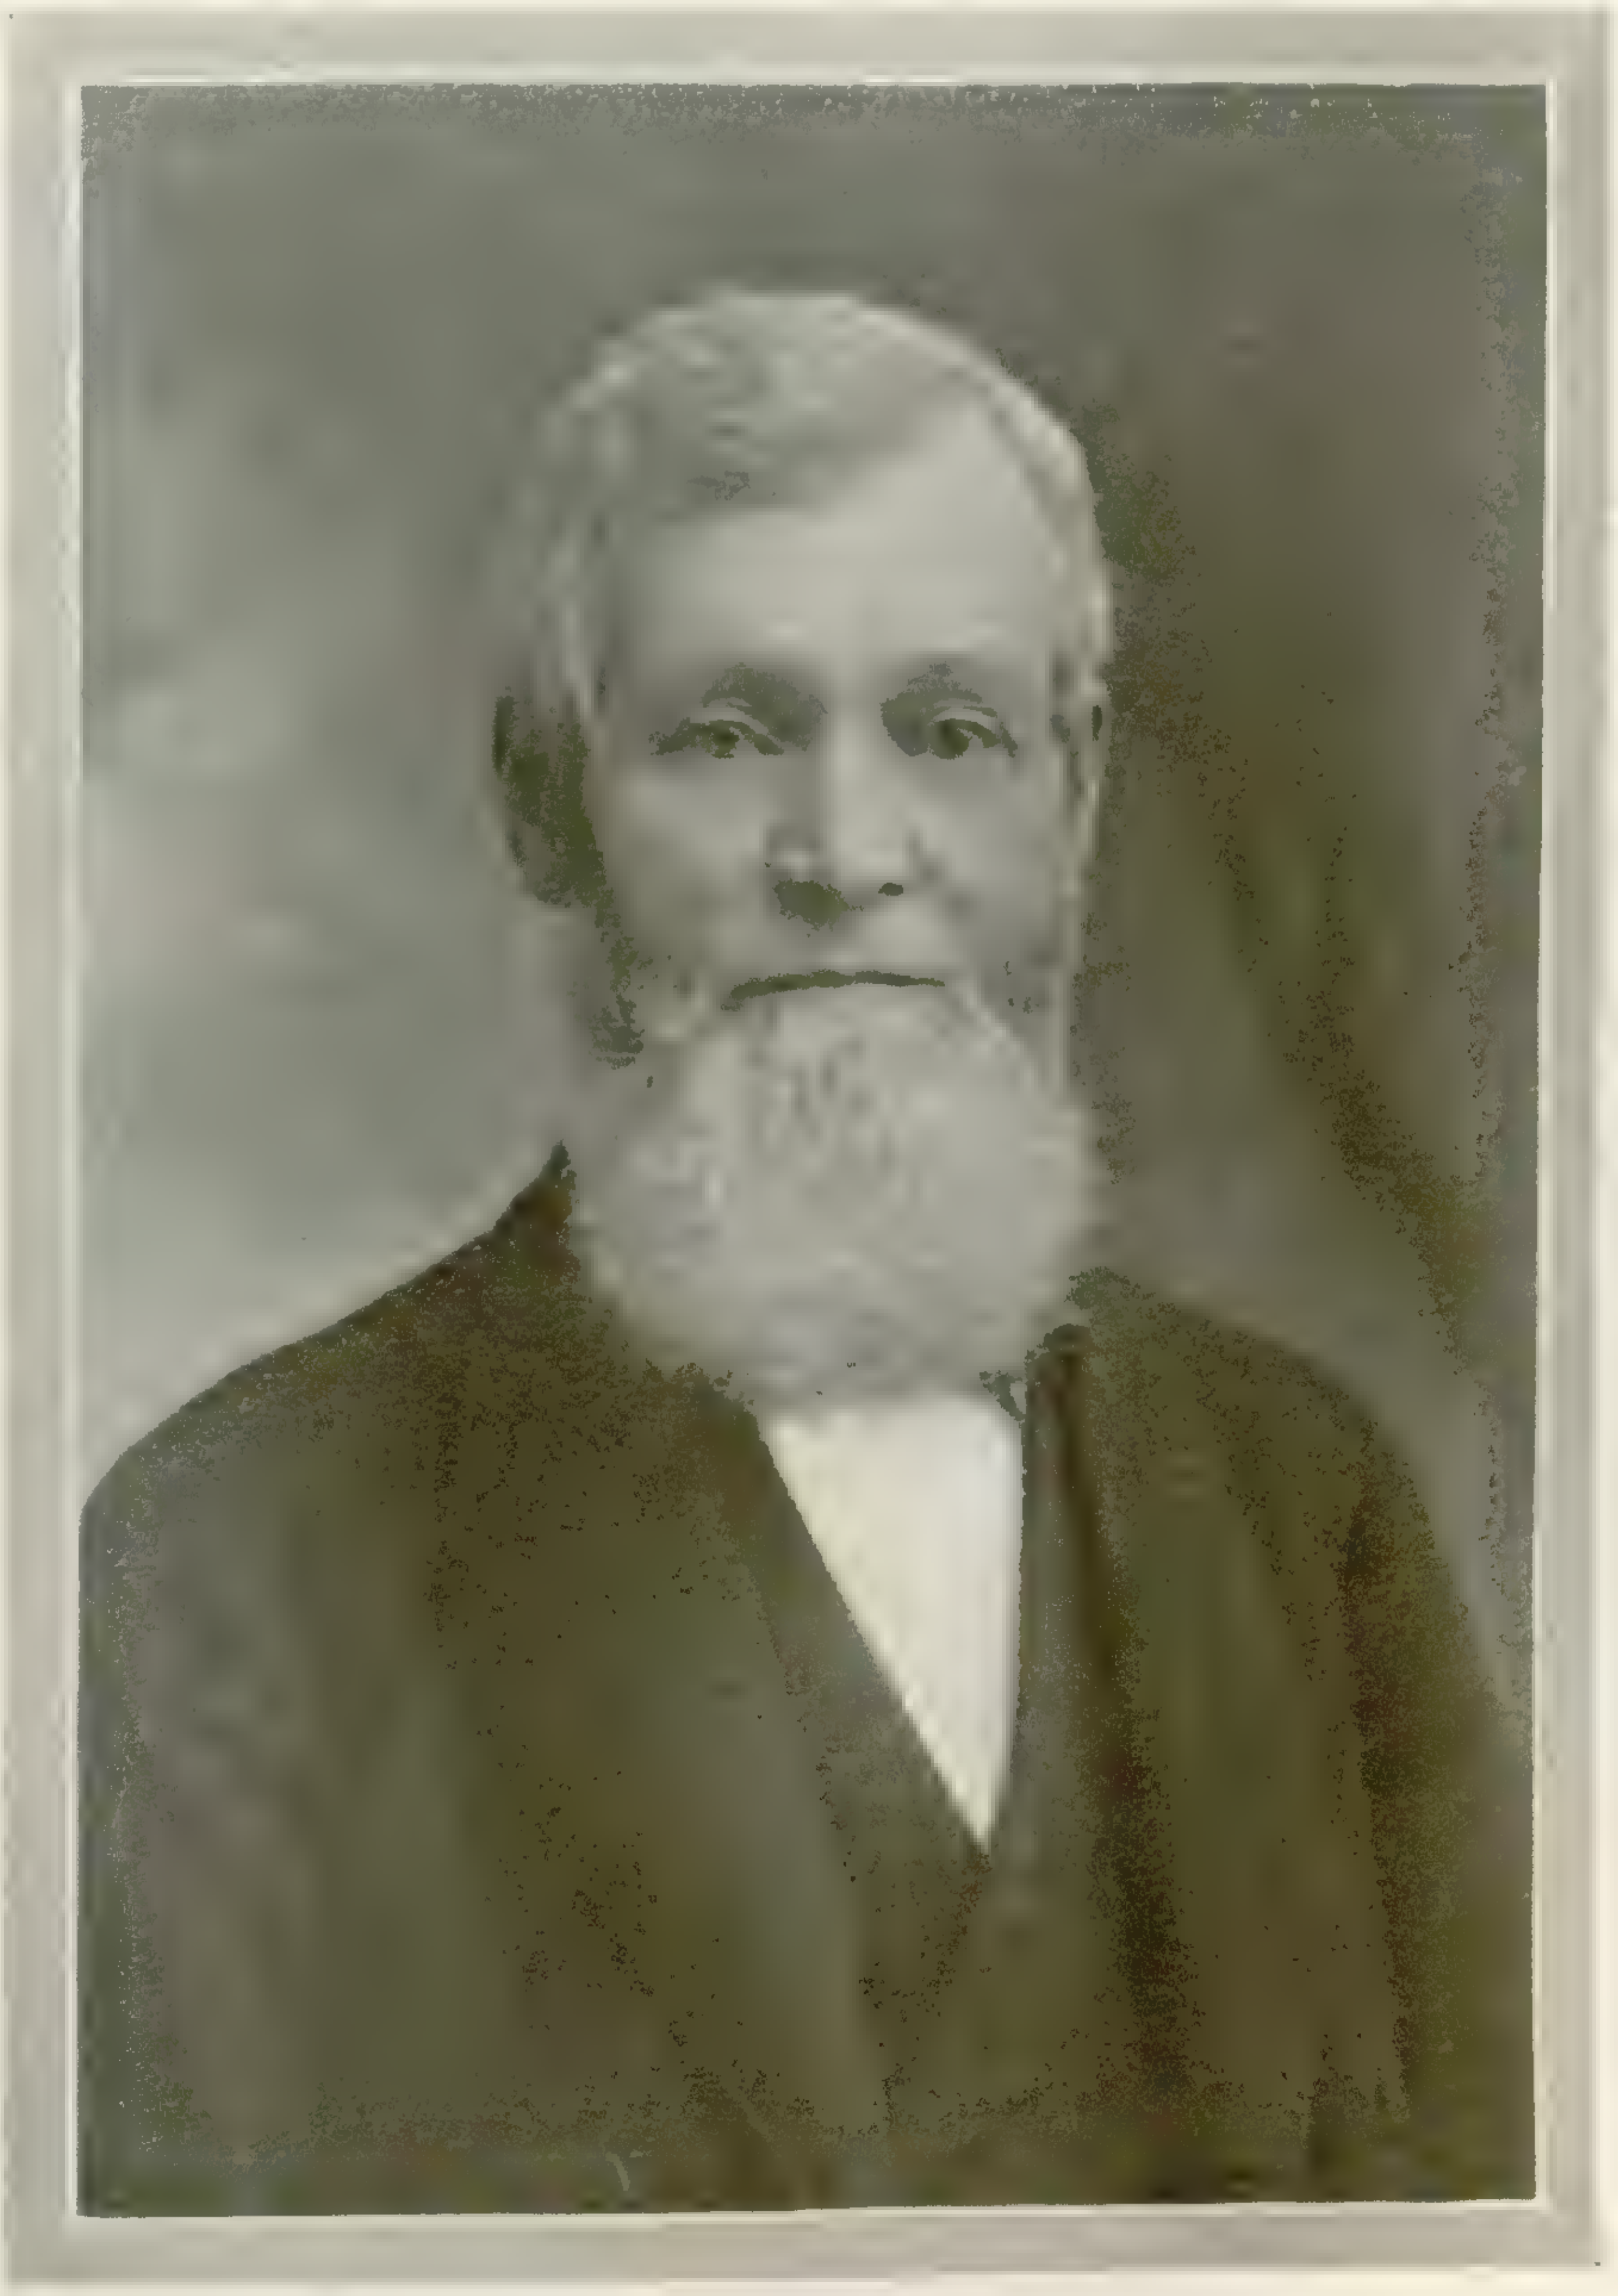
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Plant Skins.

Apart from the very obvious skins with which we become familiar when peeling an orange, banana, walnut, or other familiar dessert fruit, there are other skins which are less obvious, and are designed for protection of the delicate cell growths which form the origin and foundation of all plant structure. The primary cell itself is of necessity provided with a skin, in this case a delicate membrane devised to enclose the cell contents of sap or sap equivalent and the all-important nucleus or life centre. In the cells which build up plants, the skin is definite enough, and new cells are formed preliminarily by the formation of a cross wall of similar skin by the division in the first place of the nucleus and the eventual formation of this separative wall between the two divisions, thus, as each half perfects itself, forming two cells, and so on. If, however, this sort of skin formation continued indefinitely, the result would be a soft and practically structureless mass, quite incapable of assuming the form and carrying out the varied functions of a plant proper of the higher grades of vegetation. Hence we find that the cell has the power of varying this skin, thickening it and strengthening it; often, indeed, to such an extent, as in the case of wood cells, solidifying itself entirely. Or the cell may modify itself by assuming varied forms, and at the same time fortifying its wall or skin so as to build up supporting veins, which at one and the same time strengthen the fabric and provide channels for the sap supply from below, and the diffusion back again of the modified sap to all parts of the plant for the nourishment of the flowers, the maturation of the seed, and the strengthening of the fabric generally. Under the microscope a cross section of every leaf will show a definite arrangement of cells, with strengthened skins to form a general protective skin proper, and we shall further see that this skin is profusely supplied with little breathing orifices or stomata, through which surplus water is exhaled in one direction while the essential item of plant structure, carbonic acid gas, is absorbed from the atmosphere. This outer skin varies immensely in the different orders and species of plants. In some it is perfectly smooth, as in the holly, in others it is roughened as in the laurustinus; in some it is much corrugated, as in the primrose, and, in short, if we examine every different species of plant in our gardens, we shall find each one with a different skin to its foliage. Then, too, in the process of evolution, the leaf skin has become armed against foes of varied kinds, and also protected against climatal excesses. Thorns, bristles, hairs, and even dense woolly coverings may occur as skin growths, and these may extend to the skins of the stems as well as those of the foliage, and thus prove formidable obstacles to invading insects or effective protection against heat by preventing over transpiration through the pores aforesaid, or against frost, by acting as a blanket. There are, however, protective skins of other kinds. Just as we see in the animal kingdom the thick protective hides of the rhinoceros or elephant, so do we see in all the trees, more or less thick cuticles of bark, from that of the cork oak, with its corrugated slabs of indurated cells, to the thin, delicate, silvery coat of the birch, and all grades in between. In the fruits we see other skins of very diverse nature; no fruit is without one, and many fruits are supplied with a number. The walnut, for instance, has three, one next the seed, a thin skin proper, bitter as gall. As an additional protection, over this is the intensely hard shell, and until the fruit is ripe and this hard shell thoroughly indurated, a thick green husk of strong and unattractive flavour. The chestnut, and indeed most nuts are similarly skinned within and armour-plated without as a double or triple protection against would-be devourers of the precious seed in the centre. In some cases, such as the common equisetums, the clever cells have devised some means of dissolving the flint in the soil, carrying it up through the roots, and fortifying with it the skins of their stems and foliage; probably a very efficacious protection against the rasping tongue ribbons of the snail tribe, as well as the jaws of other insects. The skins of plants, indeed, as we have shown, are as full of multiform and multifold wonders as even the wonderful flowers to whose formation they contribute.



MR. JAMES DOUGLAS, V.M.H.

Mr. James Douglas, V.M.H., is so widely known and highly esteemed by those who have the pleasure of his acquaintance that a large proportion of our many readers will welcome the portrait of him that we have the satisfaction in giving in this issue. Many years have elapsed since Mr. Douglas entered on his horticultural career in the nursery of Mr. Tait at Kelso, and throughout this long period he has been steadfast in his devotion to floricultural and horticultural pursuits, and has done such splendid work as to fully justify the high position he has long occupied in horticultural circles. The auricula was a great favourite in the Kelso district when Mr. Douglas was at Mr. Tait's, and he thus became interested in the flower, and this interest has been fully maintained until the present time. For some forty years Mr. Douglas has been one of the leading cultivators of auriculas, and has been successful in winning prizes well-nigh innumerable for them, and, what is of still more importance, he has raised a large number of show varieties of quite exceptional excellence, as evidenced by the position they occupy in the leading collections. Coming to London towards the close of the fifties Mr. Douglas entered the nurseries of Messrs. James Veitch and Sons at Chelsea, and assisted in staging the collections exhibited by that firm at the flower show held on the occasion of the opening of the Royal Horticultural Society's gardens at South Kensington in 1860. Subsequently, he attended nearly all the shows held in the gardens, sometimes as an exhibitor and sometimes as a member of the committee, and he has also had the pleasure of visiting the gardens as a member of Council. In 1888 Mr. Douglas was appointed to a seat on the Council of the Royal Horticultural Society, and as this was the year in which the society quitted the South Kensington Gardens, he had to bear his share of the anxieties inseparable from those troublous times. He remained a member of Council for nine years, and had the satisfaction of seeing the society reinstated in public favour and entering on prosperous times. First a member of the Fruit Committee, Mr. Douglas was transferred to the Floral Committee, of which body he is a member at the present time. From the Chelsea nurseries Mr. Douglas was transferred to the gardens of Busbridge Hall, near Godalming, and on the death of the owner in 1863 he was appointed to the charge of the gardens of Great Gearies, Ilford, where he remained upwards of thirty years, an appreciative recipient of many generous considerations from his employers, who recognised in him a conscientious and unceasingly active man of business in the garden. Here he specially distinguished himself as a cultivator and exhibitor of various classes of subjects, but his greatest successes were with fruits, florists' flowers, and orchids. It is not possible to touch on particulars with regard to his successes at Great Gearies, except to say that the first prize won by Mr. Douglas was for a pine-apple at Regent's Park in 1866. Early in the nineties, on the death of the owner of Great Gearies, Mr. Douglas established the Edenside Nurseries at Great Bookham, where he has devoted his attention chiefly to carnations and auriculas, and achieved success of a high order, both as a raiser and cultivator. Mr. Douglas has been a member of the committee of the Royal Gardeners' Orphan Fund, and has served many years as a member of the committee of the Gardeners' Benevolent Institution. He was also for several years the secretary of the National Auricula and National Carnation Societies (southern sections). It should be added that Mr. Douglas was included among the first sixty recipients of the Victoria Medal of Honour in Horticulture in 1897.

Torquay Gardens.—As announced in our issue of the 5th inst., we shall give in our next week's issue the first of two illustrated articles on the public and private gardens in and around Torquay. The second article will appear in the issue for the 26th inst. The gardens of which illustrated accounts will be given will include those of Cockington Court, Eltham, Greenway, Lupton House, Normount, Pilmuir, Roby Hall, Walton Lodge, Torre Abbey, and the gardens belonging to the town.

Blanks at Flower Shows are by no means uncommon, and they so greatly militate against the success of these gatherings that they should, as far as is practicable, be guarded against. There are, as competitors are fully aware, two kinds, and the blanks we have in view are those caused by exhibitors failing to fill their entries. Dependant as exhibitors are in many cases upon the weather, which is experienced during the week or so preceding the date of the exhibitions, in having their products in proper condition, they are not wholly to blame when they fail to compete in all the classes in which they have entered. But in many cases the blanks, so painfully apparent in walking through the tents, are caused by the possibilities of the exhibitors' accomplishments not having had careful consideration at the time the entries were made. This want of care should be checked as far as possible, and we note that with this object in view, the Council of the Royal Caledonian Horticultural Society stipulate in the show regulations that "each exhibitor must, along with his entry form, deposit five shillings, which will be returned if he stages all the entries made by him, otherwise it will be forfeited." A similar regulation might be made by many other societies.

Trial of Single Chrysanthemums.—The National Chrysanthemum Society has made arrangements for a trial on a most comprehensive scale of single chrysanthemums, the primary object being to determine varieties that are too much alike. The September and October varieties will be grown out of doors by Messrs. W. Wells and Co., Lim.; the November varieties will be grown in pots by Mr. H. J. Jones, and the December varieties by Messrs. H. Cannell and Sons. In order that these trials may be conclusive in their results, the society will be greatly obliged by nurserymen or raisers possessing varieties not catalogued by the above-named firms sending to them direct cuttings now or plants later in the spring. Those who send varieties for the purposes of these trials should attach the names and give such particulars regarding growth, habit, etc., as are likely to prove useful.

Wolverhampton Floral Fete will be held on Tuesday, July 12, and the two following days, and will be on the same comprehensive scale as in previous years. The great class for a display of miscellaneous plants in and out of bloom, and flowers, with prizes of £40, £30, £20, and £10, occupies, as usual, a prominent place in the schedule, as does that for a group of ornamental foliage plants and ferns, in which the prizes aggregate £57 10s. A new and important class for a rock and water garden has been provided, and "Alpines and other plants and flowers of suitable kinds only to be used." The prizes are £21, £14, £10, and £5. Other new classes include a display of carnations, six vases of carnations, ten dishes of fruit, and a collection of caladiums.

National Amateur Gardeners' Association. — The programme of this enterprising and useful society is of interest as evidence of the excellent work that is being done in the promotion of gardening among amateurs. There are competitions and lectures monthly at Winchester House, Old Broad Street, and an annual exhibition, which will be held in the Royal Botanic Society's Gardens, Regent's Park, on July 9. The hon. general secretary is Mr. F. A. Poulton, Rosemount, Park Road, New Barnet, Herts.

Edgbaston Botanical Gardens.—We have received an illustrated booklet descriptive of these gardens, and the pleasure we have had in perusing the brightly written description of the chief features and admiring the excellent illustrations has been greatly marred by the intimation that the support given is not more worthy of the city. It is surprising to find that there are only 800 members, whose subscriptions amount to about £900, while the annual expenditure amounts to about £2,000.

Croydon Gardeners' Society. Appreciating the value of lantern slides as aids in increasing the interest and usefulness of the lectures given at the fortnightly meetings, the executive of the Croydon Gardeners' Society set itself the task of providing a lantern for their display. It was decided to have an electric lantern of the highest class, and the project was received with so much favour that the necessary funds were soon forthcoming. The lantern was installed at the meeting held on the 1st inst., and the installation had created so much interest that the large hall at Sunflower Temperance Hotel was crowded. Some 200 slides were shown, and the greater proportion of these were views of Croydon gardens. The first slide thrown on the screen was a portrait of the King, the members and their friends singing the National Anthem. Other portraits shown included the president and some prominent members of the executive. This should prove a valuable asset, and the example that has been set at Croydon might with advantage be followed by many other of the large gardening societies. The society has for some years past had a high-class microscope which has proved most useful to the members.

Influence of Grass on Fruit Trees.—Reference has on several occasions been made in these pages to the influence of grass upon the growth of orchard and other fruit trees, as demonstrated by systematic experiment. This influence has invariably been detrimental to the growth of the trees, and in the experiments that have been carried out by the National Fruit and Cider Institute Report, the results obtained by other investigators have been confirmed. The orchard of the institute was planted in 1904 with vintage varieties of apples and pears, and afforded an opportunity of investigating the effects of grass on the growth of trees. At the time of planting, circular holes, 6ft. in diameter, were dug, and this space was kept cultivated. At the end of a year after planting it was arranged that at least one tree of each variety should be treated in each of the following ways: (a) The cultivated area around the tree should remain 6ft. in diameter, (b) the cultivated area should be extended to a circle 9ft. in diameter, and (c) the cultivated area should be allowed to grass over. The measurement of the girth of the trees (at a height of 5ft. 6in.) is not the most satisfactory means of demonstrating the effect of the treatment, but it was adopted as being the one involving the least labour. The results, stated in percentage were as follows: In March, 1906, all the trees had an average girth of 100, and in March, 1909, the average girth was, cultivated area, 9ft., 194; cultivated area, 6ft., 177; and grass-covered area, 165. There can, it is stated in the report, be no doubt from these figures that the grassing over of the original cultivated area of 6ft. diameter resulted in an appreciable check to the rate of growth, while the extension of the cultivated area to 9ft. diameter was beneficial. This seems to show that it is the fine rootlets actively engaged in the absorption of food substances which are the most affected by the presence of grass.

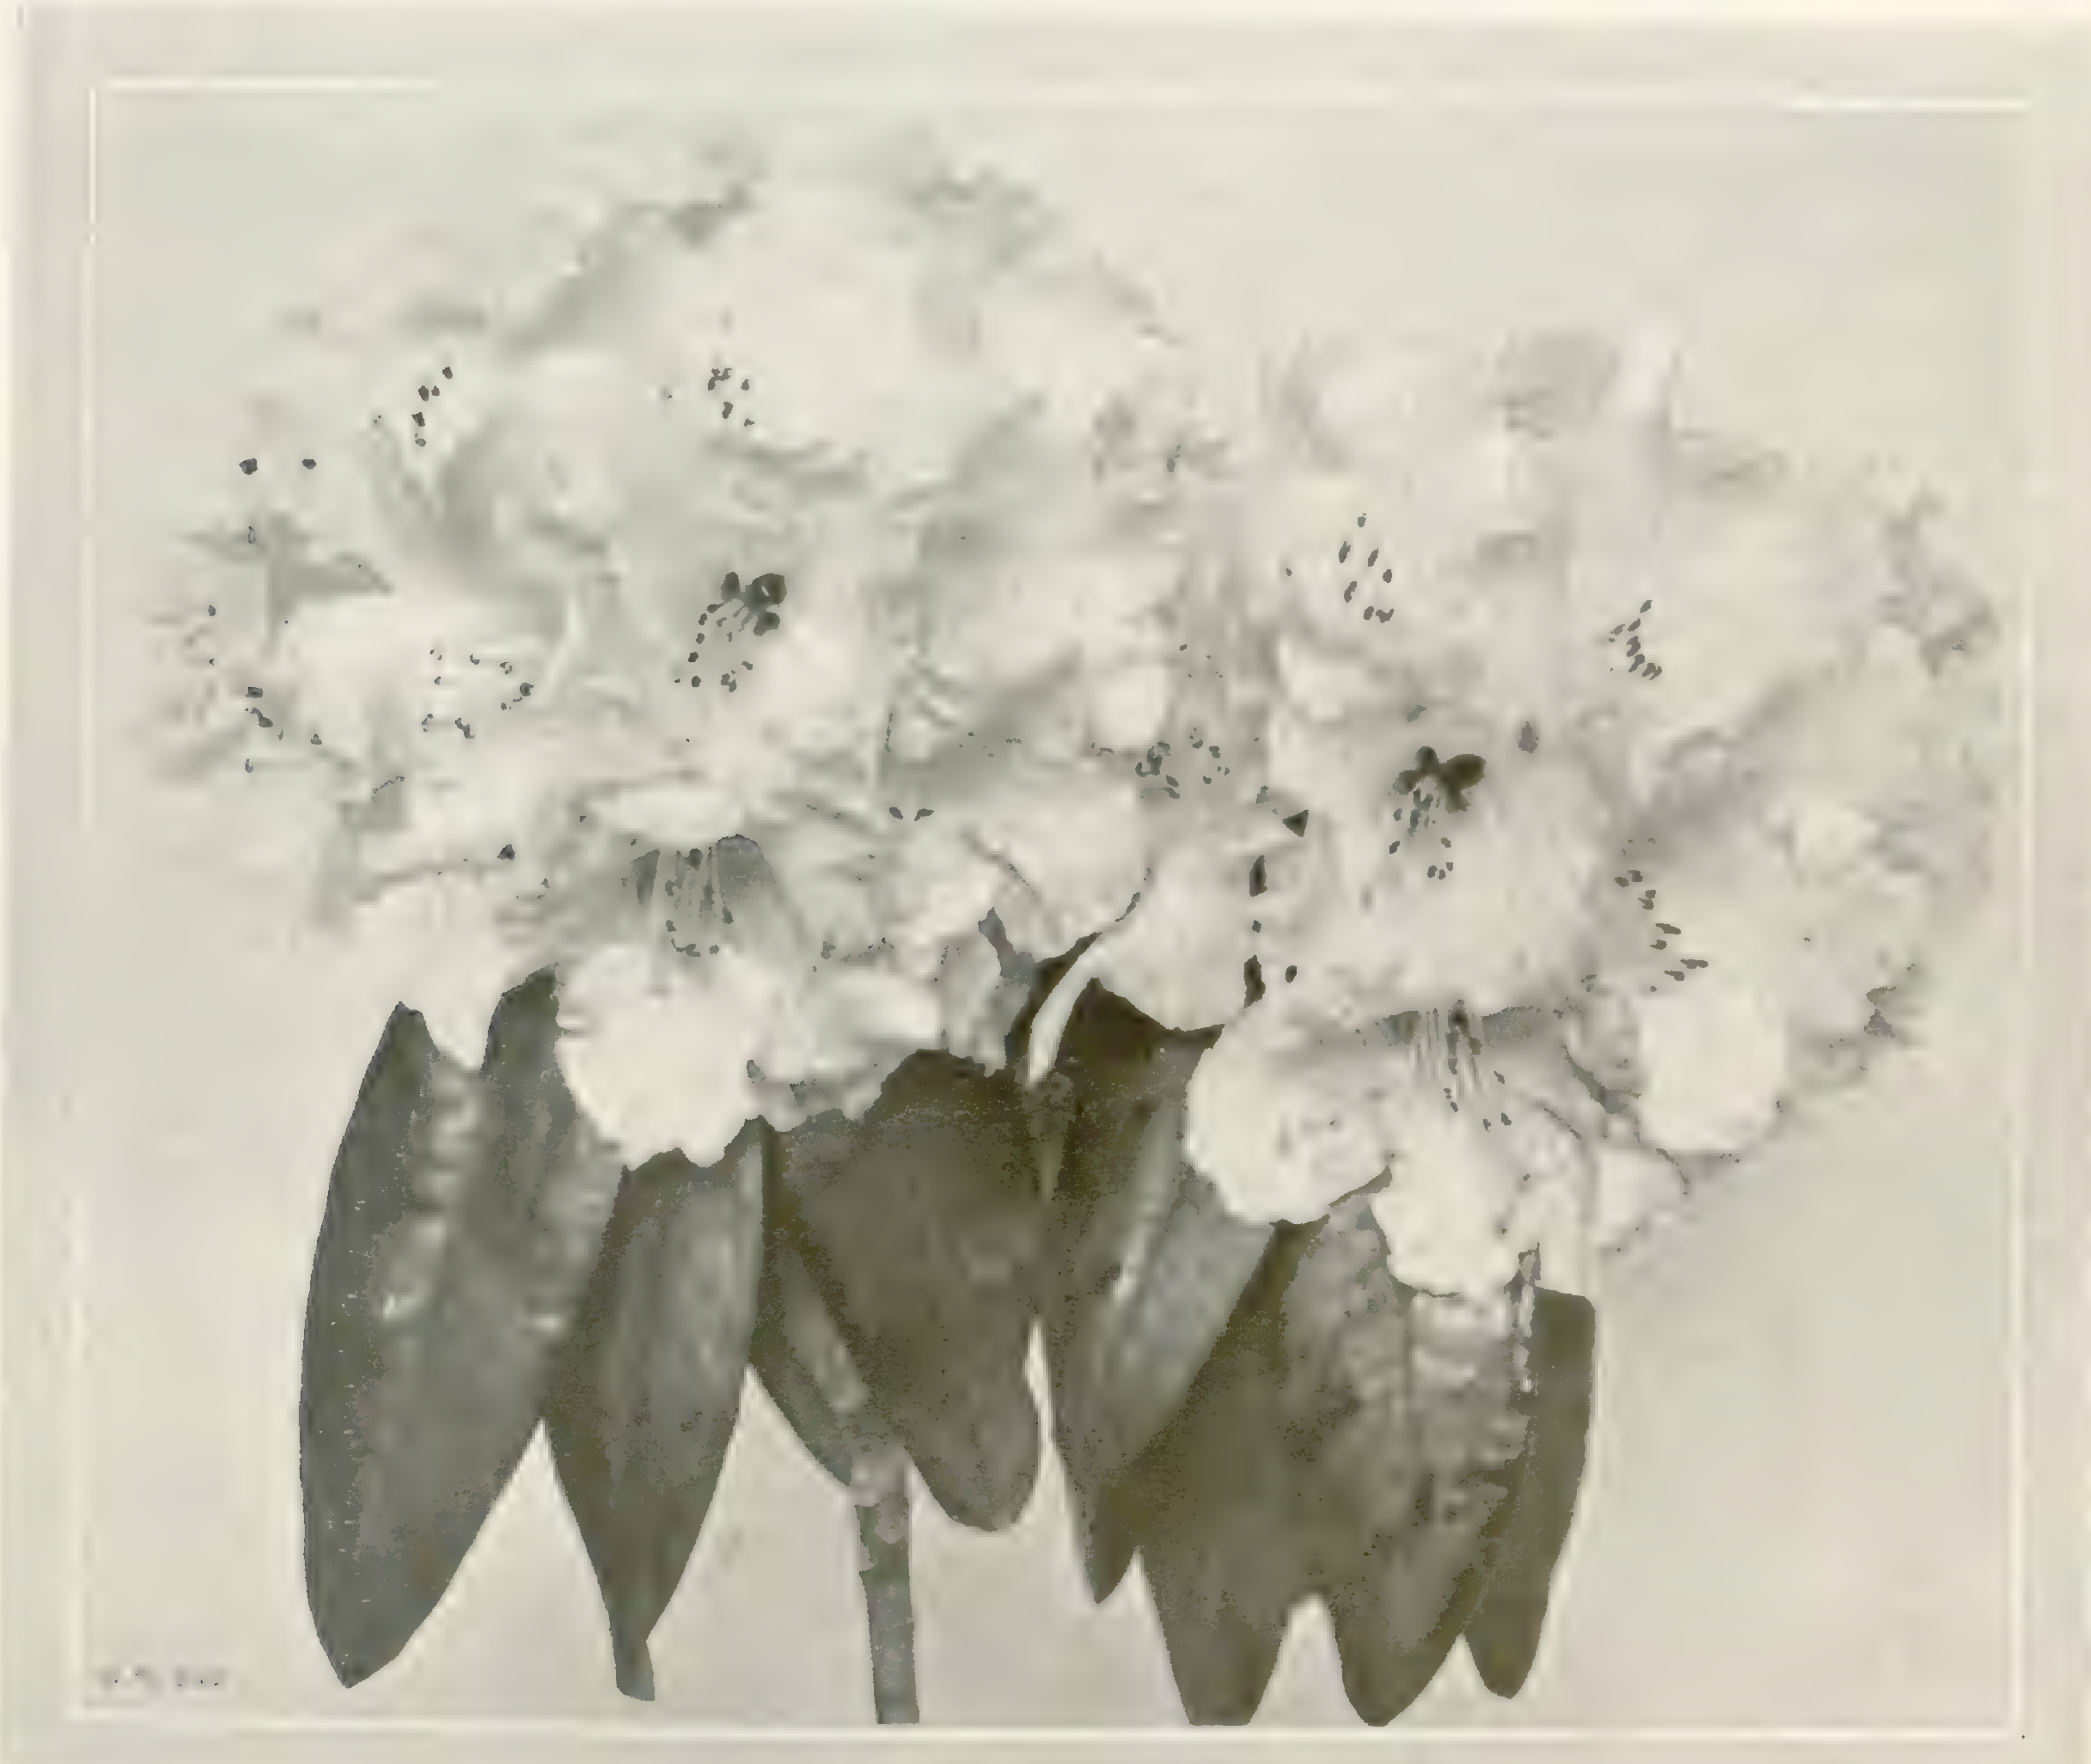
Vandalism at Blackford Hill.—The quarrying operations at Blackford Hill that are being carried out under the direction of the Mid-Lothian County Council have evoked a vigorous protest from Scotch botanists. Growing on the hill are a considerable number of British plants that are rare in a wild state, and it is feared that the excavations in progress would result in the eradication of some of them. At the monthly meeting of the Botanical Society of Edinburgh, Mr. T. Bennett Clark, C.A., the president, called attention to the matter. In the course of his remarks he pointed out that at a time when nature study was of such importance and so much in vogue in connection with every educational institution, it would be an inestimable loss were the locality, where grew so many rare plants, destroyed. At the spot where excavations were now going on existed the principal station on Blackford Hill for Lychnis viscaria one of the rarest British flowering plants. At one time it occurred in several stations in this country, but had now been destroyed or had disappeared from most of these, and at present it probably only existed in an indigenous state at one other place in Great Britain besides the station at Blackford Hill, now threatened with destruction. It was thus quite probable it might entirely disappear from the area of Blackford Hill in a short space of time if the present operations went on. Another plant was Sedum album, of which only one patch grew upon Blackford Hill, and that was in danger of being entirely destroyed. These two plants were perhaps common enough in gardens, but were among the rarest native plants. It would be a matter of deep regret if so interesting a survival of our native flora were swept away and lost to science. A committee, consisting of Mr. Bennett Clark, Mr. Symington Grieve, and Mr. Rutherford Hill, was appointed to bring the matter before Edinburgh Town Council, and, if need be, before the Scottish Office.

Horticultural Exhibition at Liverpool.—In connection with the Royal Agricultural Society's Show at Liverpool next June, it has been decided that the horticultural exhibition should be open from Wednesday, June 22, to Saturday, June 25. The classification will be similar to that provided at Gloucester last year, with the addition of classes for the best collection of eight kinds of vegetables and for the best collection of eight kinds of fruit. The Hon. John E. Boscawen, of Tregye, Perranwell, Cornwall, has been appointed steward of this section, and Mr. Peter Blair, of Trentham, has been appointed manager. The latest date for receiving entries will be Saturday, June 4, and the schedule, entry forms, and full particulars can be obtained from Mr. Thomas McRow, secretary, Royal Agricultural Society, 16, Bedford Square, London, W.C.

Greens and Green-keeping.—Under the title of "The Practical Green Keeper," Messrs. J. Carter and Co. have just issued the third edition of their work on the upkeep of all kinds of lawns, greens, etc., used for various games. The book is by Mr. Reginald Beale, F.L.S., a member of the firm, and contains a vast amount of useful information of the utmost value to those who have the care of golf courses, tennis courts, bowling greens, cricket pitches, croquet lawns, football grounds, etc. Soils, grasses, manures, seeds and seeding, weeds and weeding, and many other matters are skilfully and pleasantly discussed, and the text is freely illustrated with diagrams and reproductions from photographs.

RHODODENDRON MRS. HENRY SHILSON.

Messrs. R. Gill and Sons, Tremough, Penryn, Cornwall, have raised many beautiful rhododendrons, and have been especially successful with the species, hybrids, and varieties belonging to the Himalayan group. R. Beauty of Tremough, R. Duchess of Cornwall, R. Duke of Cornwall, R. Gill's Triumph, R. Gilli, R. Glory of Penjerrick, R. Goliath, R. Mrs. Henry Shilson, and R. Mrs. R. Gill are a few of their finest they have produced, and, in addition, they have raised several new varietal forms of R. arboreum and R. Thomsoni. R. Mrs. Henry Shilson, figured herewith, is a delightful soft pink variety, and the colour has been well described as La France pink, in reference to the shade seen in the lovely La France rose. The flowers are large and of excellent form, and borne in trusses of splendid shape and size. It is a strikingly beautiful rhododendron, and a fine companion to the richer-hued R. Duke of Cornwall and R. Gill's Triumph.



RHODODENDRON MRS. H. SHILSON.
Flowers soft pink.

EARLY SPRING IN THE GARDEN.

"Fair now is the Springtide, now earth lies beholding
With the eyes of a lover the face of the sun;
Long lasteth the daylight, and hope is enfolding
The green-growing acres with increase begun."
W. MORRIS.

Of the spring as a time of beauty it needs more than average originality of mind to speak without becoming trite, or worse, and it is only the poet, in posse if not in esse, who can show us features we have not noticed before, or say what is in many people's minds, but clothed in language which appeals to us with such charm that we try to stamp it upon our mental retina lest we forget it. When Tennyson said

"A million emeralds break from the ruby-budded lime,"

he was certainly saying nothing original, nor pointing out anything that we had not all seen with our physical eyes—which are so often "no eyes"—in common with the horse that is looking over a gate for hours at a time, but probably few of us had actually noticed the full beauty of the limes after sunrise on a dewy morning in early spring until the poet pointed it out to us. And so when he says:

"When rosy plumelets tuft the larch,
And rarely pipes the mounted thrush."

and Browning in Italy in April, thinking of the English spring, exclaims:

"Hark, where my blossom'd pear-tree in the hedge
Leans to the field and scatters on the clover
Blossoms and dewdrops—at the bent spray's edge—
That's the wise thrush: he sings each song twice over
Lest you should think he never could recapture
The first fine careless rapture!"

When, I say, our poets utter such thoughts in such language we are enriched for life by their imagination, the wonderful products of which we can make our own.

But the amateur, whose enjoyment of his garden takes the form of working, too often finds it far too busy a time for any meditation, which is unprofitable from the point of view of the season's plans. There is generally all too much work to do which would have been better done last November—a time when, unless he is a seasoned hand or an enthusiast of considerable staying power, he was tired of his hobby for the year. Much work which ought to have been done then cannot be done now with such good results, but there is, nevertheless, plenty to satisfy the most zealous, and possibly some of the most important work escapes notice altogether. It will be sufficient to give a few instances of more or less routine work which is often left till much too late or never done at all.

We have all observed on a fine March day how quickly freshly-stirred ground dries, while ground which has not been so moved remains in a sour-looking condition for a long time, and most doubtless know it is because the conduction of moisture from below to the surface is arrested by the breaking-up of the soil, so that contrary to appearance this loosening of the surface preserves the moisture in the soil below. Now we know that in an ordinary season the ground occupied by established plants, bushes, trees, etc., gets all too dry before the summer is far advanced. Hence at the earliest opportunity after March comes in the surface of the raspberry and bush fruit plantations, strawberry, rhubarb, and asparagus beds, and the soil round about dwarf fruit trees of all sorts, should be hoed all over, and where a mulch was put over last autumn it should by this time be sufficiently tender to permit of its being chopped up with the hoe and mixed with the soil. The result will be a sweetening of the soil which will be very beneficial. Of course care is necessary where there are plants below the surface, e.g., asparagus; but the stumps of last year's growth will generally serve as danger signals. With the hardy flower borders, beds of bulbs, and other spring flowers, the same kind of work should be done with a little hand-fork. This general stirring of the surface soil should only be done when there is the prospect of at least a whole day's drying weather, after which moderate rain will not destroy the friable state of the surface, but, alternating with night frosts, will probably increase it. In this way we shall preserve the moisture which will be wanted later on. But where ground is going to be dug, or prepared for sowing seeds, it should not be touched till it is getting in nice workable condition, as we want enough moisture to rise to the surface and be evaporated to make it so.

Then there is another matter far enough removed from the quotations and remarks at the beginning of these notes, and that is the application of artificial manures. With many of these applications in the summer, or even late in the spring, are of little value, but some may be used with excellent results in March, especially where no animal manure can be applied otherwise than as a top-dressing. It is too late to apply kainit and basic slag unless they can be dug in, and that in a damp soil; but nitrate of soda—that excellent stimulant and plant food, should be applied at the rate of an ounce to the square yard to rhubarb, asparagus, and strawberry beds, and gooseberry, currant, and raspberry plantations, so that it may be well washed into the soil before the dry weather comes, and also to lettuce, cabbage, and other early vegetables, as the supply of nitrate in the soil at this season is usually very low. All fruit trees should be given a dressing of superphosphate of lime or bonemeal, and the ground hoed immediately after the application, though it is getting late for the latter unless the season is a damp one. The lawn, too, may have a dressing of superphosphate in the early part of March, and even kainit if the season is wet, and then after it has been partially washed in the grass may be given its first rolling, which will complete the work of the artificials. A dusting of nitrate of soda or sulphate of ammonia may follow a little later.

Another matter which is often forgotten, or left till it is too late, is the pruning of the early-flowering shrubs, most of which, flowering as they do principally on the young wood, should not be pruned in the summer or autumn, but directly after flowering is finished, in order to encourage the formation of good strong shoots during the spring and summer. Winter jasmine, winter sweet, flowering currant, Kerria japonica, Forsythia suspensa, and the barberries are instances, and no time should be lost after they have flowered, as they will be using their vitality to no good purpose.

There is no need to touch upon the more general work of the garden at this season, such as the sowing of seeds, the pruning of roses, and the like, as there is no fear of their being forgotten, but many little matters are often neglected that if attended to would make a considerable difference in the success of the year. One is the cleaning up of all rubbish that may harbour insect pests of any description, and either burning or deeply burying it. Closely allied to this is the turning out, or moving, everything that may have afforded shelter to slugs and snails for the winter, as well as setting traps for them—heaps of bran, cabbage leaves, tiles, etc.—as there is no time like this to raid them. The thinning-out of the shoots of perennials should be done as early as it can be seen which are the strongest, while there is no better time in the case of many of them for taking off small rooted pieces for propagation, these making nice plants by the autumn for next year. Another tedious operation is the thinning of fruit blossom on dwarf trees as soon as the separate flowers on the trusses can be removed, always leaving the strongest. The birds, too, which may have left the buds on the currant and gooseberry bushes untouched all the winter, often make a set for them when they begin to swell, probably owing to the exhaustion of other supplies of food at this season. The bushes should be dusted with lime and soot on a damp morning.

The doing of these and many other often forgotten, and more or less uninteresting, operations in the garden will by no means lessen one's enjoyment of the spring when we have the leisure to enjoy it. A busy man once said that the greatest enjoyment the garden furnished him was the contemplation on Sunday of the work done during the past week. A majority of people spend their Sundays to much less advantage, and an hour or two of the day passed in this calm and restful way will not have been spent in vain, even from a higher point of view, if we bear in mind Wordsworth's lines:

"Think you, 'mid all this mighty sum
Of things for ever speaking,
That nothing of itself will come,
But we must still be seeking?"

ALGER PETTS.

BLUE HYDRANGEAS.

Many cultivators of hydrangeas strive to obtain blue flowers, and fail to do so, while others possess plants that bear huge heads of blue blossoms. Sulphate of iron, alum, and iron filings have been applied to the soil by some cultivators with success in some instances, and failure in others. For more than ten years I had charge of a large garden in Hampshire, in which nearly one hundred huge bushes grew in the open borders. A few specimens measured quite nine feet across, and bore scores of heads of flowers nearly every year. There were always a few large clusters of flowers on these plants which measured about fifteen inches across. The bushes were not cut back.

Some of them grew in extremely dry borders, and others in ground constantly saturated with water, which soaked through it from two large ponds. A number bore intensely blue flowers, with a few pale pink ones on the same bushes; while others, growing only a dozen yards away, had deep pink blossoms, and this mixture of colour and variation was the same both in bushes growing in dry, as well as in damp soil, year after year. On the same estate, nearly two miles from the gardens, hydrangeas of large size grew in cottagers' gardens, and bore blue flowers chiefly. The water used in the gardens soaked through the valley in the woods, some of the ground there being boggy. Where the water dripped for a time from the taps on to the gravel beneath, the stones turned to a deep reddish-brown colour; the water was very hard, and contained iron. I have seen fine blue-flowered hydrangeas in Bournemouth in a sandy border, but never any to equal those here referred to.

G. B.

KELWAY'S
BEAUTIFUL GLADIOLI.

The magnificent spikes of the large flowered Kelway Gladioli are pre-eminently the flowers for decoration. All Kelway bulbs are grown in this country and are therefore far hardier than those imported from warmer climates; they may be relied upon to thrive in English soil and they are specially suitable for growth in towns.

Beds or groups of a colour are a glorious sight from July to the time of frost.

NOW IS THE TIME TO PLANT.

Choice named collections at 3/-, 4/6, 6/-, 7/6, 9/-, 12/-, 18/-, and 26/- a dozen; from 22/6 to 140/- per 100.

YOUNG PERPETUAL CARNATIONS.

The influence brought to bear upon the early youth of plants seals, to a very large degree, their future destiny.

A cool-grown, hardy young carnation may not have quite such an attractive appearance to the untrained eye as stock potted in very rich soil and grown in an abundance of moisture and heat. The latter will make a heavy soft spring growth which too often misleads the inexperienced. Yet it is like comparing a spoilt boy with an athlete. To obtain the best results from perpetual carnations, it is imperative that you commence with good stock, and such can only be obtained by normal treatment. You cannot expect to buy such at the same price as you would the more quickly and cheaply grown stock.

Previous to potting the rooted cuttings they should be hardened to withstand light and air, so as to minimise the check. It is most essential that a young perpetual carnation should be grown in a strong, direct light, and, if the cutting has been rooted hardy and cool, only slight shading from the strongest sun for a few days is required, while it is never wise to allow them to be in a great heat for lack of air even when freshly potted. I believe a two-inch pot is the best to put the rooted cuttings in. The roots should be washed free of sand by dipping them into water. The best compost to use is pure, good loam and sharp sand. It is not wise to pot deep or too hard, but both in moderation.

The young plants are best stood on ashes and given a little space between the pots. We, as yet, have not found a substitute for good light and air. It is these two elements which will do more to build up a hard, sturdy young plant than all the elaborate potting composts or overhead syringings in the world.

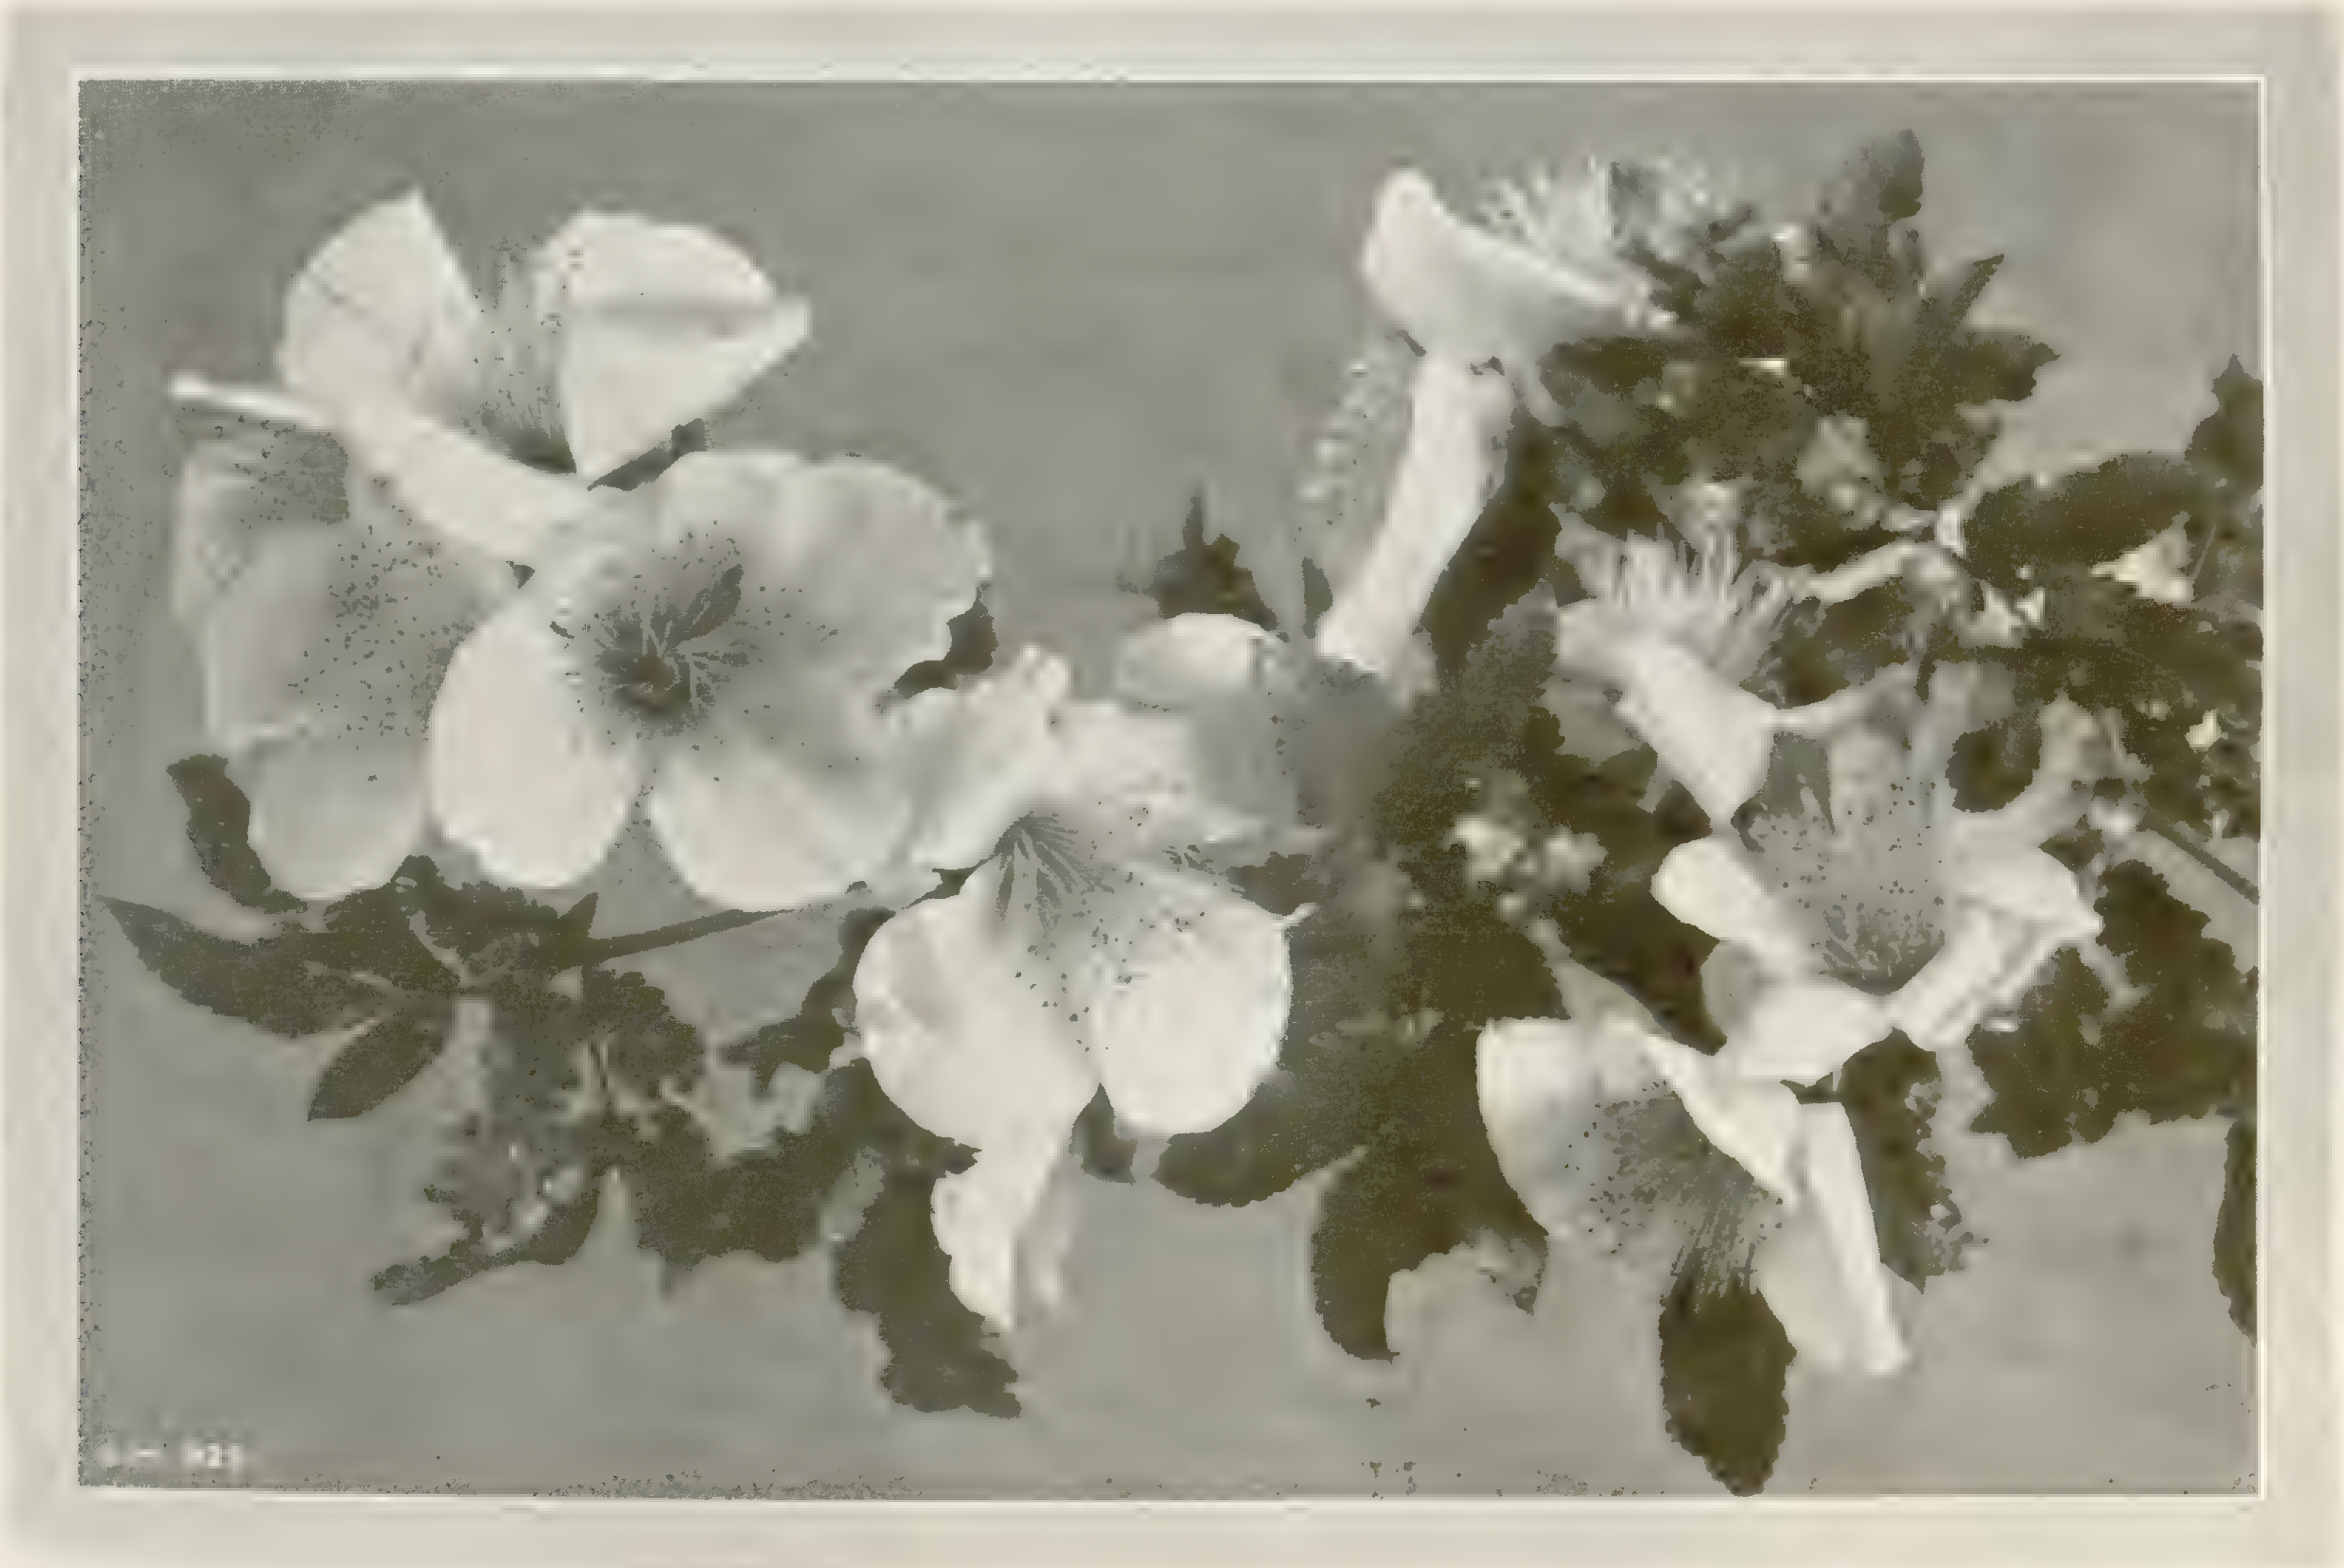
Some will think it waste of time and labour to put a young carnation cutting into a two-inch pot, with the knowledge that it will require to be shifted into a three-inch pot some two or three weeks later, but the difference between plants potted into small pots in the first place and those over-potted is surprising.

The best night temperature is from 40 to 45 degrees. This will appear ridiculously low to some who are of an impatient nature, yet a sturdy-grown young plant, with practically no spaces between the leaves, will eventually make the larger specimen, and this can only be obtained by cool, light, airy conditions.

Montagu C. Allwood.

EUCRYPHIA PINNATIFIDA.

This distinct and beautiful Chilian shrub is so well deserving of a place in all gardens which enjoy the advantages of a kind climate that it would be possible to urge some justification for writing at length with regard to its merits. There is, however, no occasion for doing so, as all that is necessary may be said in a comparatively few words. The shrub was introduced to this country from Chili thirty years ago, and if it has not been planted so extensively as could be wished, a sufficient number of plants are in cultivation to admit of a correct estimate being made as to its adaptability to the climatic conditions that obtain in this country. It has proved as hardy as a considerable proportion of the shrubs that are generally regarded as hardy, but its constitution is not such as will admit of its being successfully grown throughout the United Kingdom. As in the case of some other of the Chilian shrubs that have been introduced to this country, it has a preference for a soft and somewhat humid atmosphere, such as that of Devon and Cornwall. It will grow fairly well in many parts of England other than the western counties; but the progress is slow where the shrubs are exposed to the keen winds characteristic of the eastern counties, and also when they have to bear the low temperatures that are sometimes experienced in the midland and northern counties. Hence when we wish to see really fine specimens we must seek them westward. In both Devon and Cornwall there are many good specimens, but the most noteworthy is probably at Trewidden, the Cornish seat of T. B. Bolitho, Esq. This has a height of between eighteen and nineteen feet, and measures about twenty feet through; and it blooms with remarkable profusion. Good results are obtained in the southern counties of England, and at Buxted Park Mr. Prinsep has been remarkably successful. Broadly stated, this eucryphia may be planted south of the Thames, and in the western counties of England with the full assurance of success. There are many hundreds of gardens north of the Thames in which the shrub may be expected to succeed, and in these it should have a trial. If it succeeds, the specimens will form most attractive features, and should the results not prove satisfactory, they can be removed and replaced by hardier subjects. Good turfy loam to which peat and leaf-mould has been added will form the best compost. The proportions should be three parts each of loam and peat, and one part of leaf-mould. In gardens that are much exposed a position where the specimen can be screened from the east winds should be selected if practicable. The flowers range from two to three inches in diameter, have clusters of stamens with white filaments, and are produced at the end of July or during August, according to the season and the district. Our illustration is a reproduction of a photograph of a spray that was shown by Messrs. J. Veitch and Sons, Lim., at a meeting of the Royal Horticultural Society in July last.



EUCRYPHIA PINNATIFIDA.
A beautiful Chilian shrub, bearing pure white flowers.

THE PREPARATION OF VEGETABLES FOR EXHIBITION.

(Concluded from page 170.)

◆

Kidney Beans.

The middle of April is sufficiently early for the first sowing of this vegetable, while subsequent sowings can be made every two or three weeks until the end of June: the seeds should be buried to a depth of one and a-half inches, while a space of two feet should be left between the rows, and three inches between each drill. After cultivation will consist of thinning out the young seedlings to a space of twelve inches apart, and the most successful pods will be those of a fleshy green, and fair-sized appearance, the pods being fresh and brittle.

Runner Beans.

The soil and situation most suitable for this vegetable are similar to those required for kidney beans. From the first week in May until the end of July sowings may be made at eight or nine inches apart. Eight-feet poles are usually employed, upon which the plants are trained, but if these are not obtainable, the beans may be kept short, and of dwarf habit, by frequent pinching. After cultivation is the same as in the case of kidney beans.

Beetroot.

A sowing should be made at the end of April in a rich, light, sandy soil, one that has been well dug and manured for a previous crop of celery being preferable. The drills should be from sixteen to eighteen inches apart, and the seeds covered to a depth of one to one and a-half inches with fine soil. After cultivation will consist of thinning the plants to about ten inches apart, and in October selected roots may be lifted and buried in sand or dry soil in a cool shed until required for exhibition. In heavy, retentive soils it is impossible to grow beetroots of uniform size and shape without boring holes, which must be filled with sifted soil, one plant being allowed to each hole. Well-formed roots of a medium size and fine texture, with a dark colour and fibre circles wide apart will be most successful as prize winners.

Leeks.

For purposes of exhibition the leek is perhaps one of the most important vegetables, more especially in the northern districts, where its culture seems to be more popular than in the South. Sowings are usually made about the middle of January, while some growers adopt the practice of growing young plants in pots, placing three to four seeds in each pot, and removing all except the strongest seedling when they become established. Good results are secured by mixing with the soil a generous proportion of leaf-mould, or perhaps a quantity of manure from an exhausted mushroom bed. After sowing, the pots are sheltered in a forcing house and grown in heat until the end of April. For planting out, a specially prepared trench must be dug to a width of two feet and a depth of one and a-half spits. The bottom of the trench is filled with fresh horse or cow dung, pressed firmly into a solid compact mass, and alternative layers of manure and soil are then dug in until the trench is full. Holes are dibbled fifteen inches deep and eighteen inches apart, and the young plants inserted therein. Stiff brown paper collars are now necessary in order to secure a large proportion of blanched stem, and as the plants grow the collars are pulled up, and the earth drawn up round the base of the plants. Nourishment may be provided in the form of liquid manure, but these applications must be made judiciously in order to avoid a coarse or rank growth. Thick stems of an even growth, with a good length of well-blanched stalk, free from spots or bulbous indications at the base, will prove most successful.

Onions.

In order to produce prize onions sowings should be made in the early part of January in a gentle heat. At the end of February the seedlings may be pricked out into some good fertile soil, that in which last season's chrysanthemums have been growing being admirable in this respect. The onions may be planted about three inches apart each way, while a fairly equable temperature of about 56 degrees should be maintained, the plants being kept as near the glass as possible. After transplanting them into cold frames at the end of March, and encouraging a strong healthy growth, they should be carefully lifted with a trowel, without disurbing the roots, and planted out in April after a shower of rain.

When well established, nourishment may be provided in the form of fortnightly dressings of liquid manure, soot, or some approved chemical fertiliser, feeding being discontinued at the end of July. Eight or nine days prior to the exhibition the bulbs should be lifted and placed bottom upwards; this will render the bulbs and skins firmer and the necks smaller, while to ensure success they should also be globular, clear, and of uniform size. A clear, shining, and transparent skin is obtained by removing the coarser outer skin of the bulb about a month before lifting.

Parsnips.

These require a long season of growth, and must be sown as early in February as possible. The ground should be trenched to a depth of nearly three feet, and a good layer of manure placed in the bottom; with a powerful dibber holes are made about three feet deep and eighteen inches apart, these being filled with some good soil, in which should be mixed a good proportion of leaf-mould and sand, a little wood ashes and soot being also beneficial. The holes must be filled and the compost rammed in firmly. A few seeds are sown in the centre of each hole; as soon as the young seedlings show the first rough leaf they must be thinned out to two or three plants, and at a later stage to one strong vigorous-growing plant. Little attention will then be required beyond keeping the ground free from weeds, and, when required for exhibition, they should be carefully lifted, washed with a soft cloth, and kept as moist as possible. Smooth, well-coloured, and even-sized roots will be most successful.

Peas.

As a general rule, sowings of peas should take place about the middle of May in ground which has been well dug and manured in the usual manner during the previous autumn. The peas should be sown about two inches apart, and when they have attained a growth of a few inches they may be earthed up and staked in the usual way; a good dressing of soot prior to watering will assist in developing a deep green colour, and to conserve moisture, the application of lawn mowings will be found beneficial. The rows should be kept ten feet apart, the intervening space being utilised for other subjects. Pods of good uniform size, green and fresh, and well filled with tender seeds will be most successful.

Potatoes.

Late varieties of potatoes are usually the best for exhibition purposes; medium-sized tubers should be selected and started in February in a gentle heat. In the first week in April they may be planted out three feet between the rows, and one foot between the sets in ground which has been previously well trenched and manured. Little attention will then be necessary beyond the usual hoeing and earthing up. Some slight protection must be afforded for the first few weeks from the effects of frost, and the tubers should be earthed up about the middle of May, all the blooms being detached at the same time. Lifting must be performed very carefully, and the tubers should be thoroughly cleansed, the most desirable qualities being a good even shape and size, with shallow eyes, and a clean and spotless appearance. J. G. Newsham.

Old Basing, Hants.

HOT WATER FOR NEWLY-PLANTED VINES.

In many instances vine borders are made during the winter months, as there is generally more time to deal with work of this kind then than at any other period. The carting of the turves employed for this purpose has often to be effected in frosty weather, so that the ground over which they have to pass may not be cut up. Under these conditions the turves are frozen through, and if the border is made straight away its temperature cannot fail to be very low. The fresh horse droppings incorporated in the compost in some of the borders tend to increase the warmth in the mass, but rarely to such a degree as to render it fit for the roots of growing vines. No matter how vigorous the canes or healthy the roots of the vines planted in such a medium, the result is bound to be everything but encouraging.

Many examples of vines existing under those conditions have come under my notice, and when the temperature of the border has had to be tested to verify the cause of the weakness of growth, it has been found as low as 40 degrees. In all cases where the borders have been made when the compost was cold, I have found a good soaking with water at a temperature of about 90 degrees at the time the vines were planted an excellent antidote. Sometimes I have given a second soaking in about a week's time after the first, and put a foot in thickness of fresh stable manure on the surface to preserve the warmth in the soil. Under this treatment the young vines have broken strongly, made laterals as thick as my forefinger, and finished off as brown as a nut. To anyone who has prepared his vine borders during the cold winter months I would strongly suggest giving the foregoing idea a trial, if hot water can possibly be obtained, even although it should mean considerable trouble to secure it. Pedestrian

Campanula isophylla. — For edging stages this species is most useful. A batch of cuttings should be put in, placing four in a 2½in. pot. When rooted keep them on a shelf near the glass for a time, and then shift into 4½in. pots. Old examples that are neat and robust can be shifted into larger pots.—W. Staward.

There is no better guide to the kitchen garden than Vegetables and their Cultivation, by T. W. Sanders. It is a complete treatise on the general management of the garden, and the successful culture of vegetables, saladings, and herbs for home use. Price 5s. net, by post, in box 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

DEEP VINE BORDERS.

So well known is it that the best of grapes are in many cases grown upon vines that have their roots confined to moderately shallow borders, and that borders of this description are less expensive to form than are deep ones, that were anyone venturesome enough to recommend the latter, he, to say the least, would not likely be complimented upon his advice. All the same, and though I advocate the use for this purpose of moderately shallow borders, I think that too much stress is sometimes laid upon their necessity, as well as upon the ingredients used in their composition. In this, as in other similar cases, some cultivators appear to have faith in but one way of attaining satisfactory results. I have cause to arrive at somewhat different conclusions to these with respect to vine borders, from experience gained at The Hendre, upon which I will pass some brief remarks.

In the first place, if I am allowed to digress slightly from my subject, I would say that upwards of thirty years ago, when paying a visit to Mr. Roberts, who had at that time charge of the gardens at Gunnersbury Park, he showed me vines infested with phylloxera, and pointed out its effects upon their roots and leaves. So impressed was I with some unnatural conditions to the leaves, and their resemblance in this respect to an unaccountable irregularity in those of the vines at The Hendre, that upon returning home I at once went to the vineries, and there, by the aid of a lens, found the dreaded pest. After the vines in five vineries were destroyed, and other radical measures had been taken to thoroughly eradicate the phylloxera, new borders were made on the piecemeal principal. One of them was placed wholly inside a house having dimensions of 39ft. by 15ft., owing to circumstances that could not be remedied, and, after being provided with ample drainage material, had, unfortunately, as we considered, a depth of four feet of compost, which merely consisted of heavy turfy loam, liberally mixed with mortar rubble, and old porous bricks finely broken, together with what few wood ashes we could command—a not very elaborate composition.

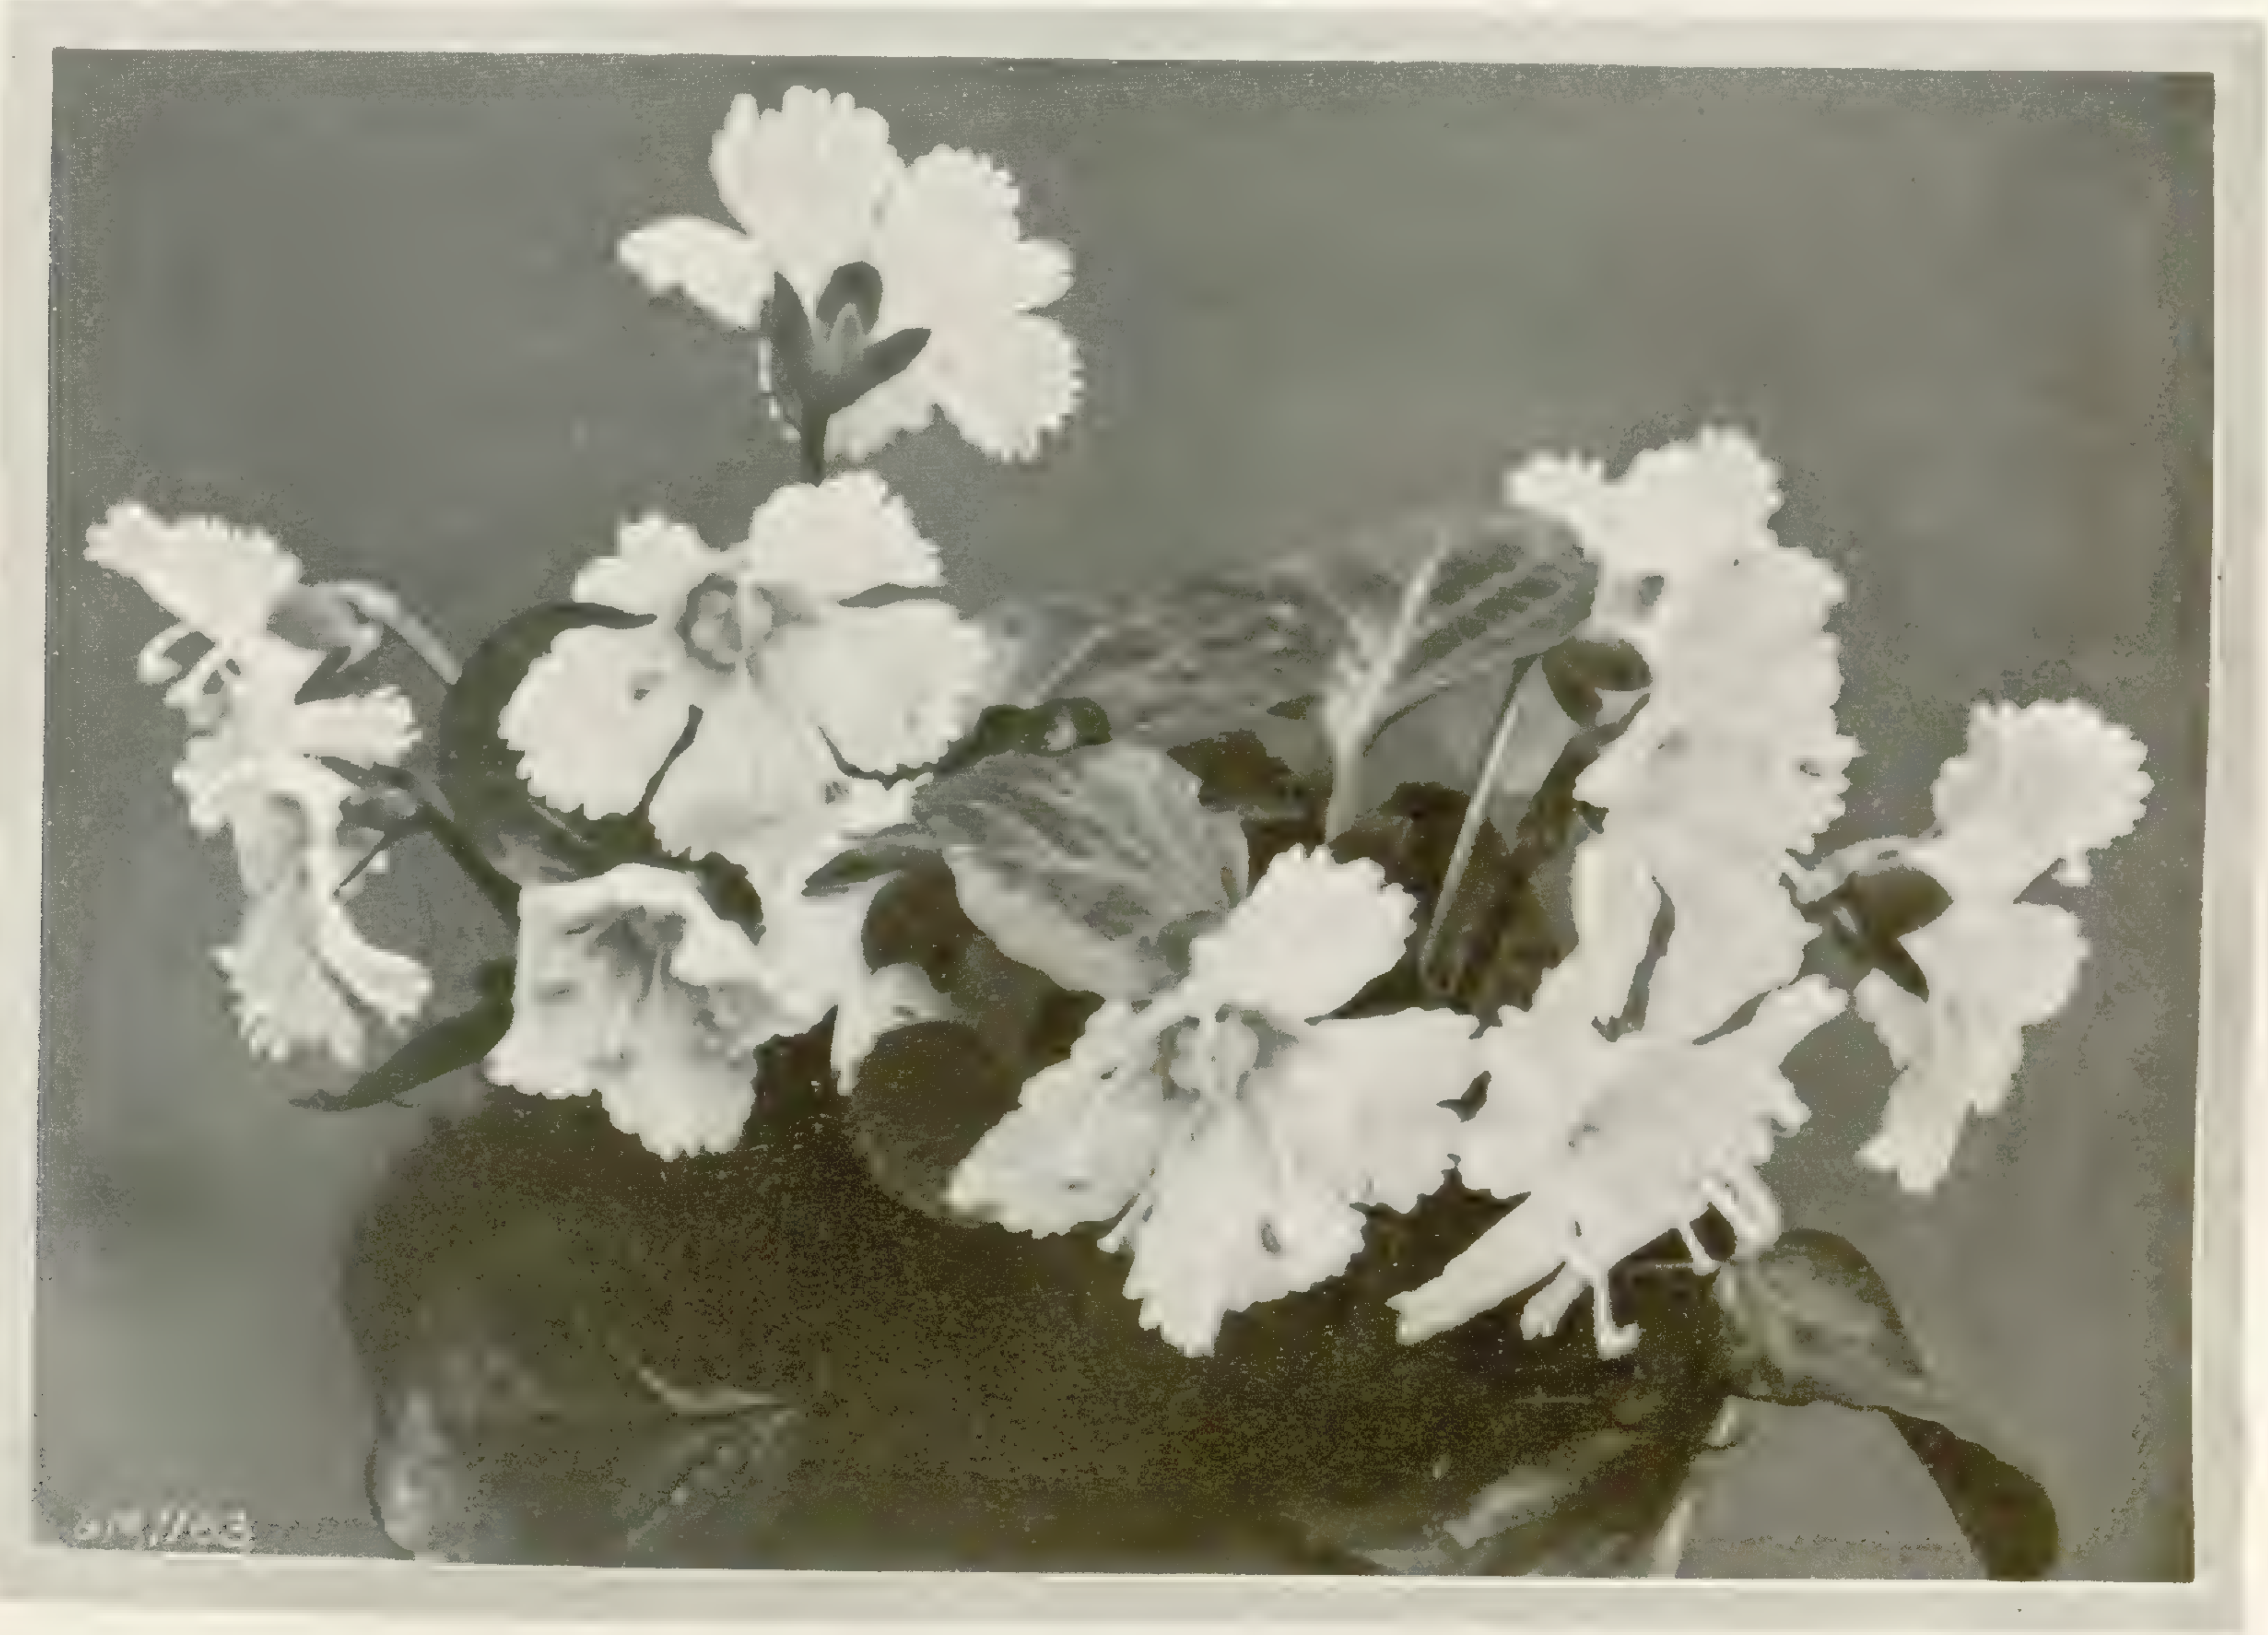
The vines planted in this border at that date, viz., thirty-one years ago, still occupy the house, and their roots have at no time been disturbed, further than that occasioned by yearly top-dressing the border with fresh compost, and all we know about their condition is that we find at such times a plentiful supply of fibrous ones on the border's surface. The vines, with one exception, are trained upon the single rod system, and are spur-pruned in the ordinary manner. They were, however, some years since cut down, and provided with young rods. Owing to the way the house is constructed, the vines have bare stems of five feet before reaching their trellis, and some of these stems at the present time are eleven inches and twelve inches in circumference. The vines have yearly yielded moderately heavy crops of good fruit; in fact, some of the best grapes grown at The Hendre in my time have been produced by these vines, and four of the seven varieties that we staged last autumn at the Royal Horticultural Society's Hall, and for which a silver-gilt Knightian medal was awarded, were cut from them.

The vine borders here, with respect to their composition, are all made upon the lines of the one described, no rich ingredients having been used, and the vines until they reached a full bearing state, and had well filled their borders with roots, had no manurial assistance. Since that stage was reached, however, they have been regularly supplied with top-dressings of artificial fertilisers or with liquid manures.

In writing these notes I do not wish to convey the opinion that I prefer deep vine borders to moderately shallow ones; that would give an erroneous impression. I merely wish to point out to the inexperienced that it is not strictly essential to adhere to one mode, however good it may be, of making borders in order to grow good grapes, and that one need not hesitate to venture upon grape growing, provided he has only comparatively simple means of carrying it into practice. I was recently questioned by an amateur gardener upon this subject, who, from what he had read and been told, had arrived at the conclusion that it was useless for him to attempt to grow grapes with ordinary conveniences though he was desirous of doing so.

T. Coomber.

The Hendre Gardens.



SHORTIA UNIFLORA GRANDIFLORA.

A beautiful variety, remarkable for the relatively large size of its flowers. A.M., R.H.S., March 8. Mr. Grandfield.

APPLE WARNER'S KING.

Undoubtedly, as a tree, this variety makes a splendid bush, pyramid or standard. But I think more espaliers should be grown in gardens, as the branches of these are held more firmly against the strong winds; and there are few varieties of which the fruits are so liable to be blown down as those of Warner's King when growing on the branches of pyramids and standards. Next to espaliers, bushes with their stout branches are the best. I have known small growers who have lost all their best fruits from standard trees owing to the winds blowing them down before they were ripe or fit to gather.

If I wished to grow Warner's King for exhibition I should certainly have a few espaliers in addition to the other forms of trees. Where there are standards, pyramids, and bushes, some protection from the strong gales should be given. This applies to all kinds of fruit trees, practically, but to Warner's King especially.

G. B.

POLLINATION.

Pollination, or that process by which the ovule or embryo seed is fertilised by a pollen grain, formed, it may be, at a considerable distance, and even on a separate plant, ranks undoubtedly among the most subtle phenomena of plant life. The conveyance of the one sexual element to the vicinity of the other is effected by innumerable diverse contrivances involving mediation of insects of various kinds and that of wind and water. In this connection it is undoubtedly the insect agency which has done most in the evolution of flowers from simple forms of little charm to complex ones of extreme beauty. The keynote to this has been the fact that the greater the conspicuousness of a flower, the greater has been its fitness to attract the insect world, and hence by gradual steps floral development has proceeded on the lines of brighter colours, larger blooms or groups of blooms, and greater floriferousness generally, until we have been endowed with that wonderful wealth of beauty we now possess.

Here it may be argued that much of this is due to human selection, but it must not be forgotten that, quite independently of that, there are innumerable perfectly wild and unsophisticated flowers which are fully equal to man's selective triumphs, though due entirely to that sympathetic interrelation between insect taste, so to speak, and floral response to which we have alluded. One of the most remarkable phases of pollination consists in the devices of flowers, not merely to attract insects by their conspicuousness, but to furnish other attraction in the shape of honey glands so placed as to ensure that when they are reached the adjacent pollen shall attach itself to the insect visitor, and so be conveyed, as a rule, to another and distant flower, involving cross-fertilisation rather than self-fertilisation.

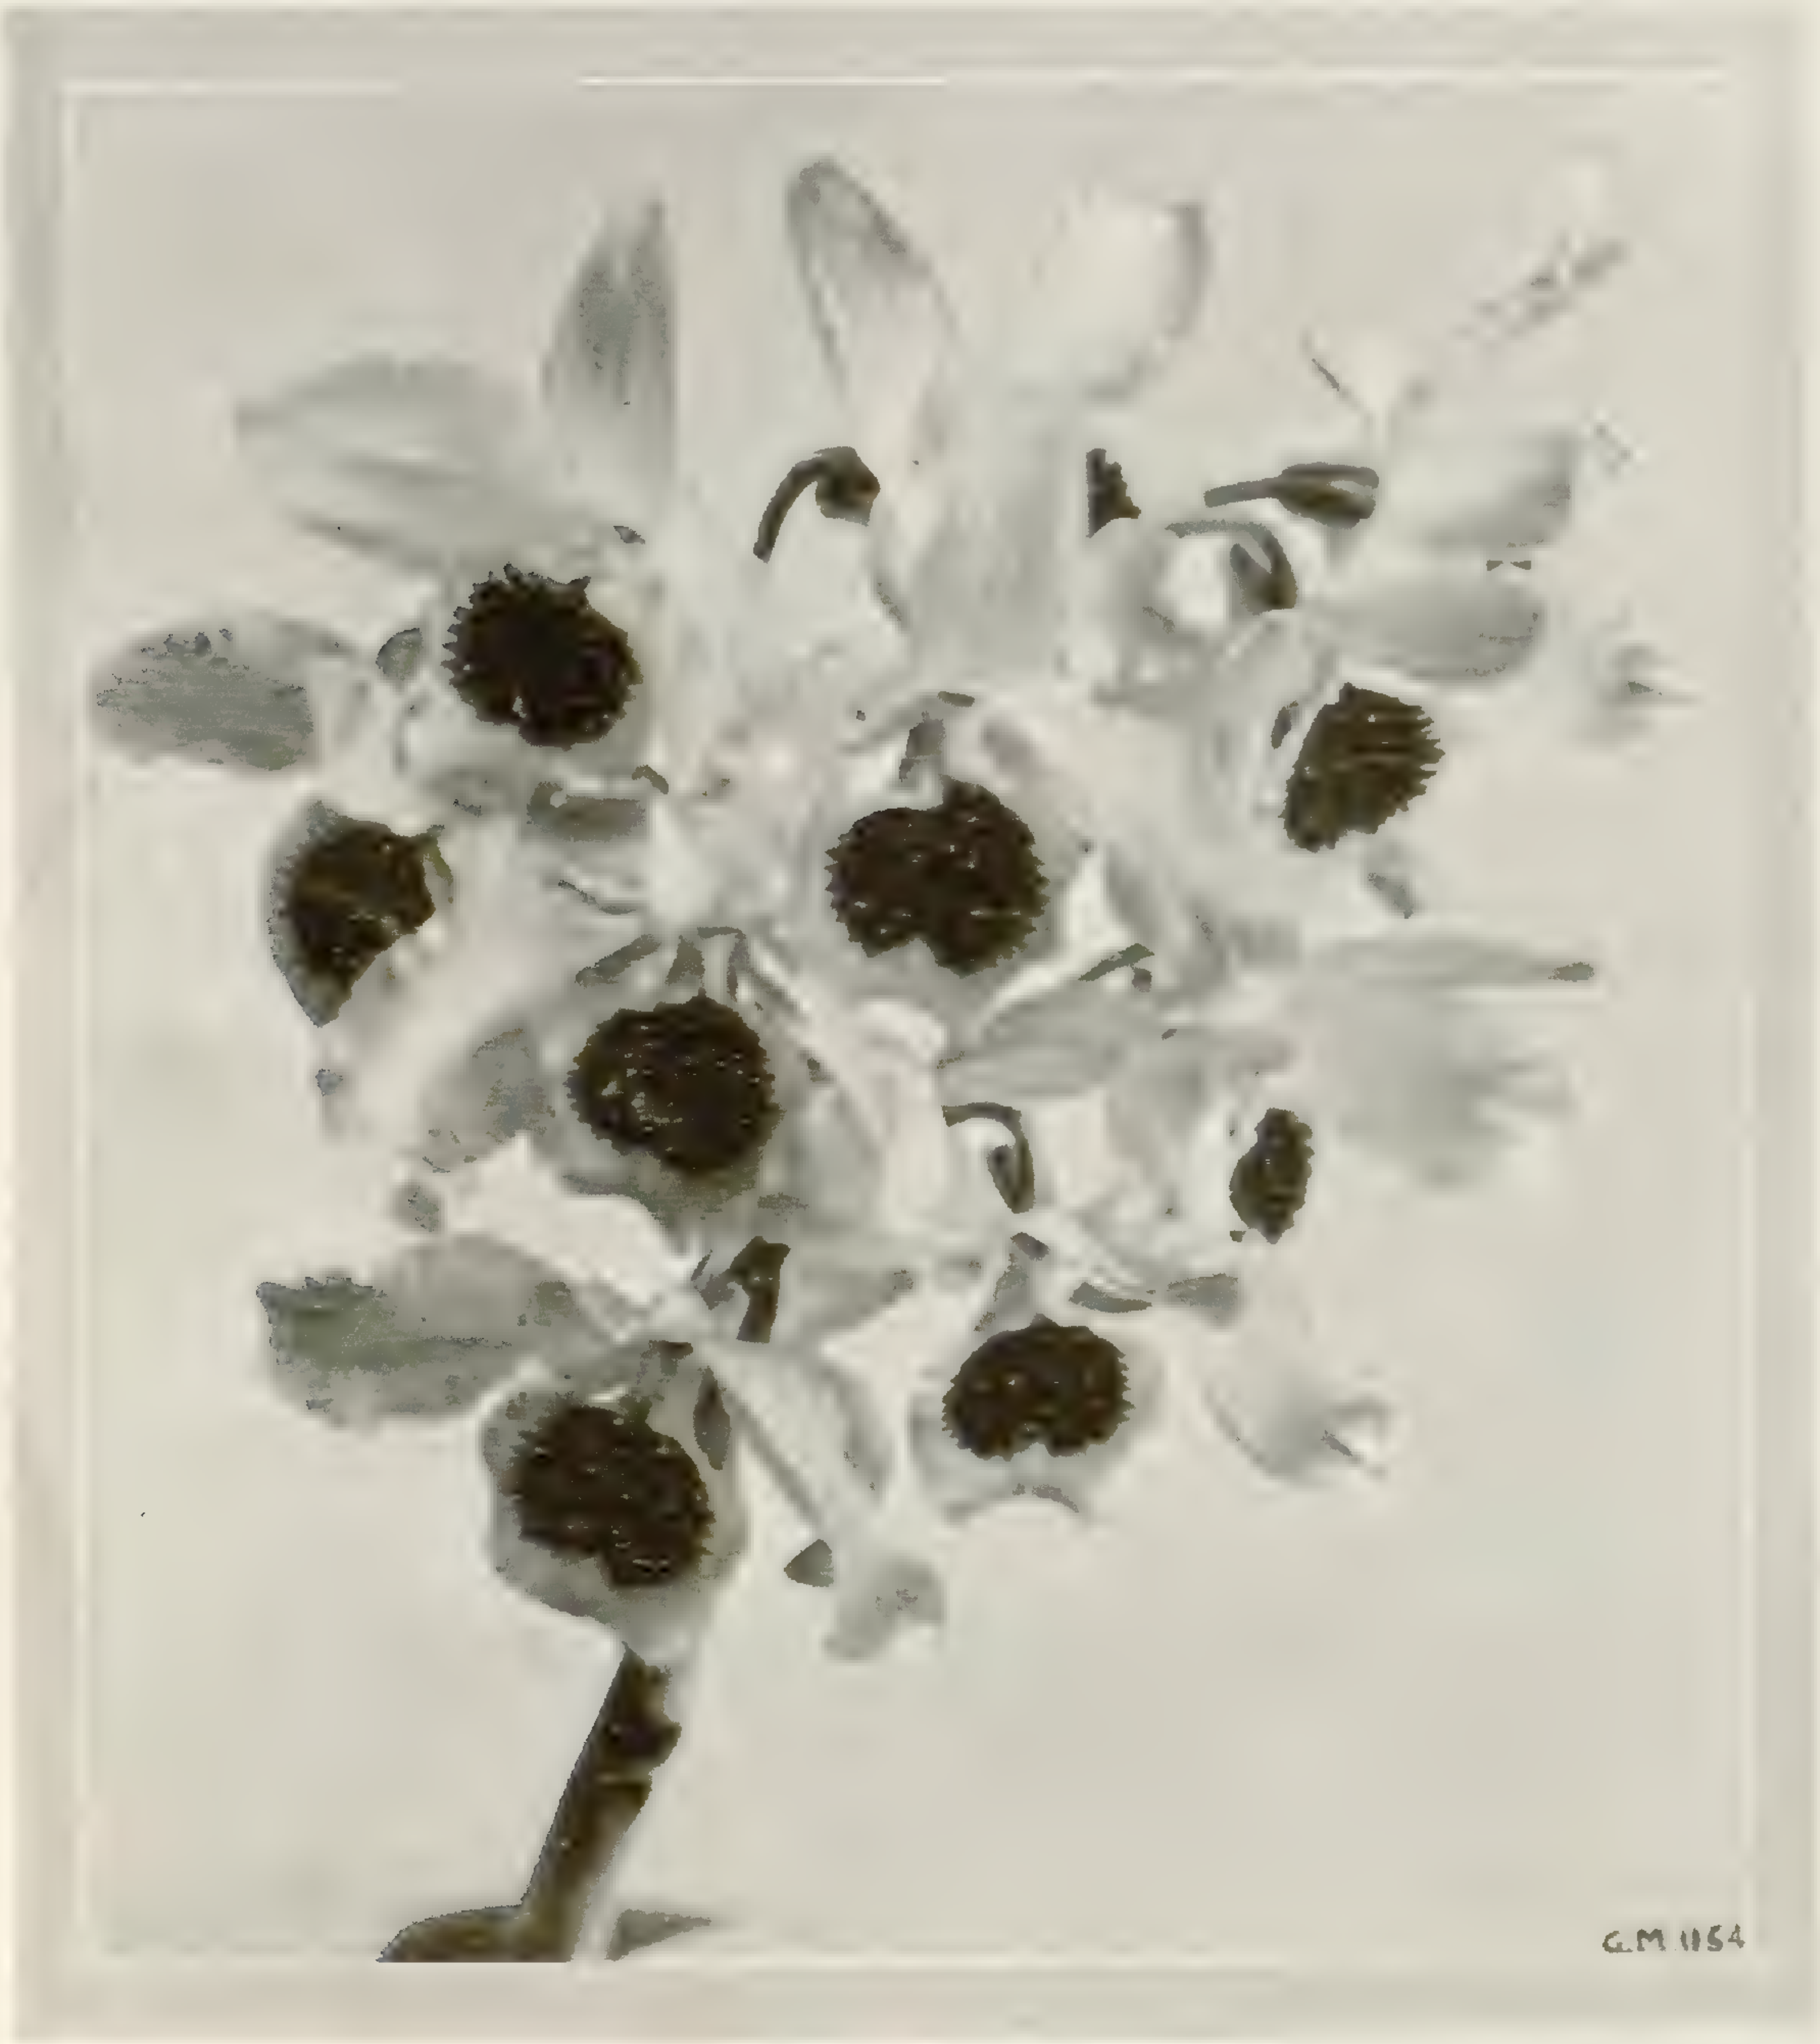
Consider for a moment the marvel involved in the pollination of the little orchis O. maculata, where the forehead of the intrusive bee becomes adorned with two little hornlike stalked pollen masses. These when first attached are nearly upright, and hence would form an obstacle to the entrance of the bee to another narrow-mouthed corolla. These horns, however, are attached by a sort of gum, so delicately composed or distributed that during the bee's subsequent short flight the two little horns are drawn downwards, always in a forward direction, so that eventually they are pushed straight into the next visited corolla and fertilisation is thus effected.

A myriad examples of these subtle arrangements could be cited, but one suffices to show the extreme cleverness, so to speak, of Nature's contrivances for pollination. In another direction we have equal subtlety in the adjustment of the material of the pollen grain to the work it has to perform before reaching the ovule in the ovary or embryo seed capsule. In the flower, taking the commonest type, we find usually in the centre a stigma or stalk-like projection tipped with a viscid knob: at the base of this is the seed vessel. The pollen grain reaching this knob, by any of the means aforesaid, adheres to it and then protrudes a rootlike closed tube, which forces its way between the cells of the stigma, passing completely down it until it reaches the ovary and one of the contained ovules or embryo seeds.

We must now go back a little. The pollen grain when ripe consists of a fecundating cell, associated with material sufficient to form the conveying tube; but this cell differs from ordinary cells inasmuch as it has thrown off half of the all-essential nucleus or life centre, so that it is really only one-half of a complete cell and cannot multiply itself. The embryo seed in the capsule has done precisely the same thing, so that in each case room is left for a combination into a perfect cell gifted with reproductive powers.. At the tip of the pollen tube there is contained the male half-cell, and when it reaches the ovarial half-cell the two conjoin, and by virtue of their conjunction are able to build up the seed, and the process of pollination is completed. From this it is clear that a pollen grain can only fertilise one seed, and we are therefore confronted with the wonderful fact that, taking the poppy as an example, with its enormous number of seeds in a capsule, the stigma must be traversed by as many tubes as there are eventual perfect seeds. Here, however, we see another of Nature's adjustments. An examination of a poppy head shows the stigma, not as a slender stalk, but as a slightly elevated series of ridges, thus providing the needful room for an immense number of tubes.

It is comparatively easy to comprehend that the combination of two half-cells of similar parents as described, can lead to the creation of a new plant of the parental type, but in the case of hybrids or varietal crosses, where each parent may show very distinct characters, it is clear that the two half-cells can only combine with reproductive effect by adopting a compromise and inventing a practically new scheme of architecture to meet the case. Mendel has shown us that they do this, not by an absolute and indissoluble coalition of characters, but by a more or less temporary alliance, which is apt to be broken up at the critical period when seminal reproduction is again to be effected.

Chas. T. Druery, V.M.H., F.L.S.



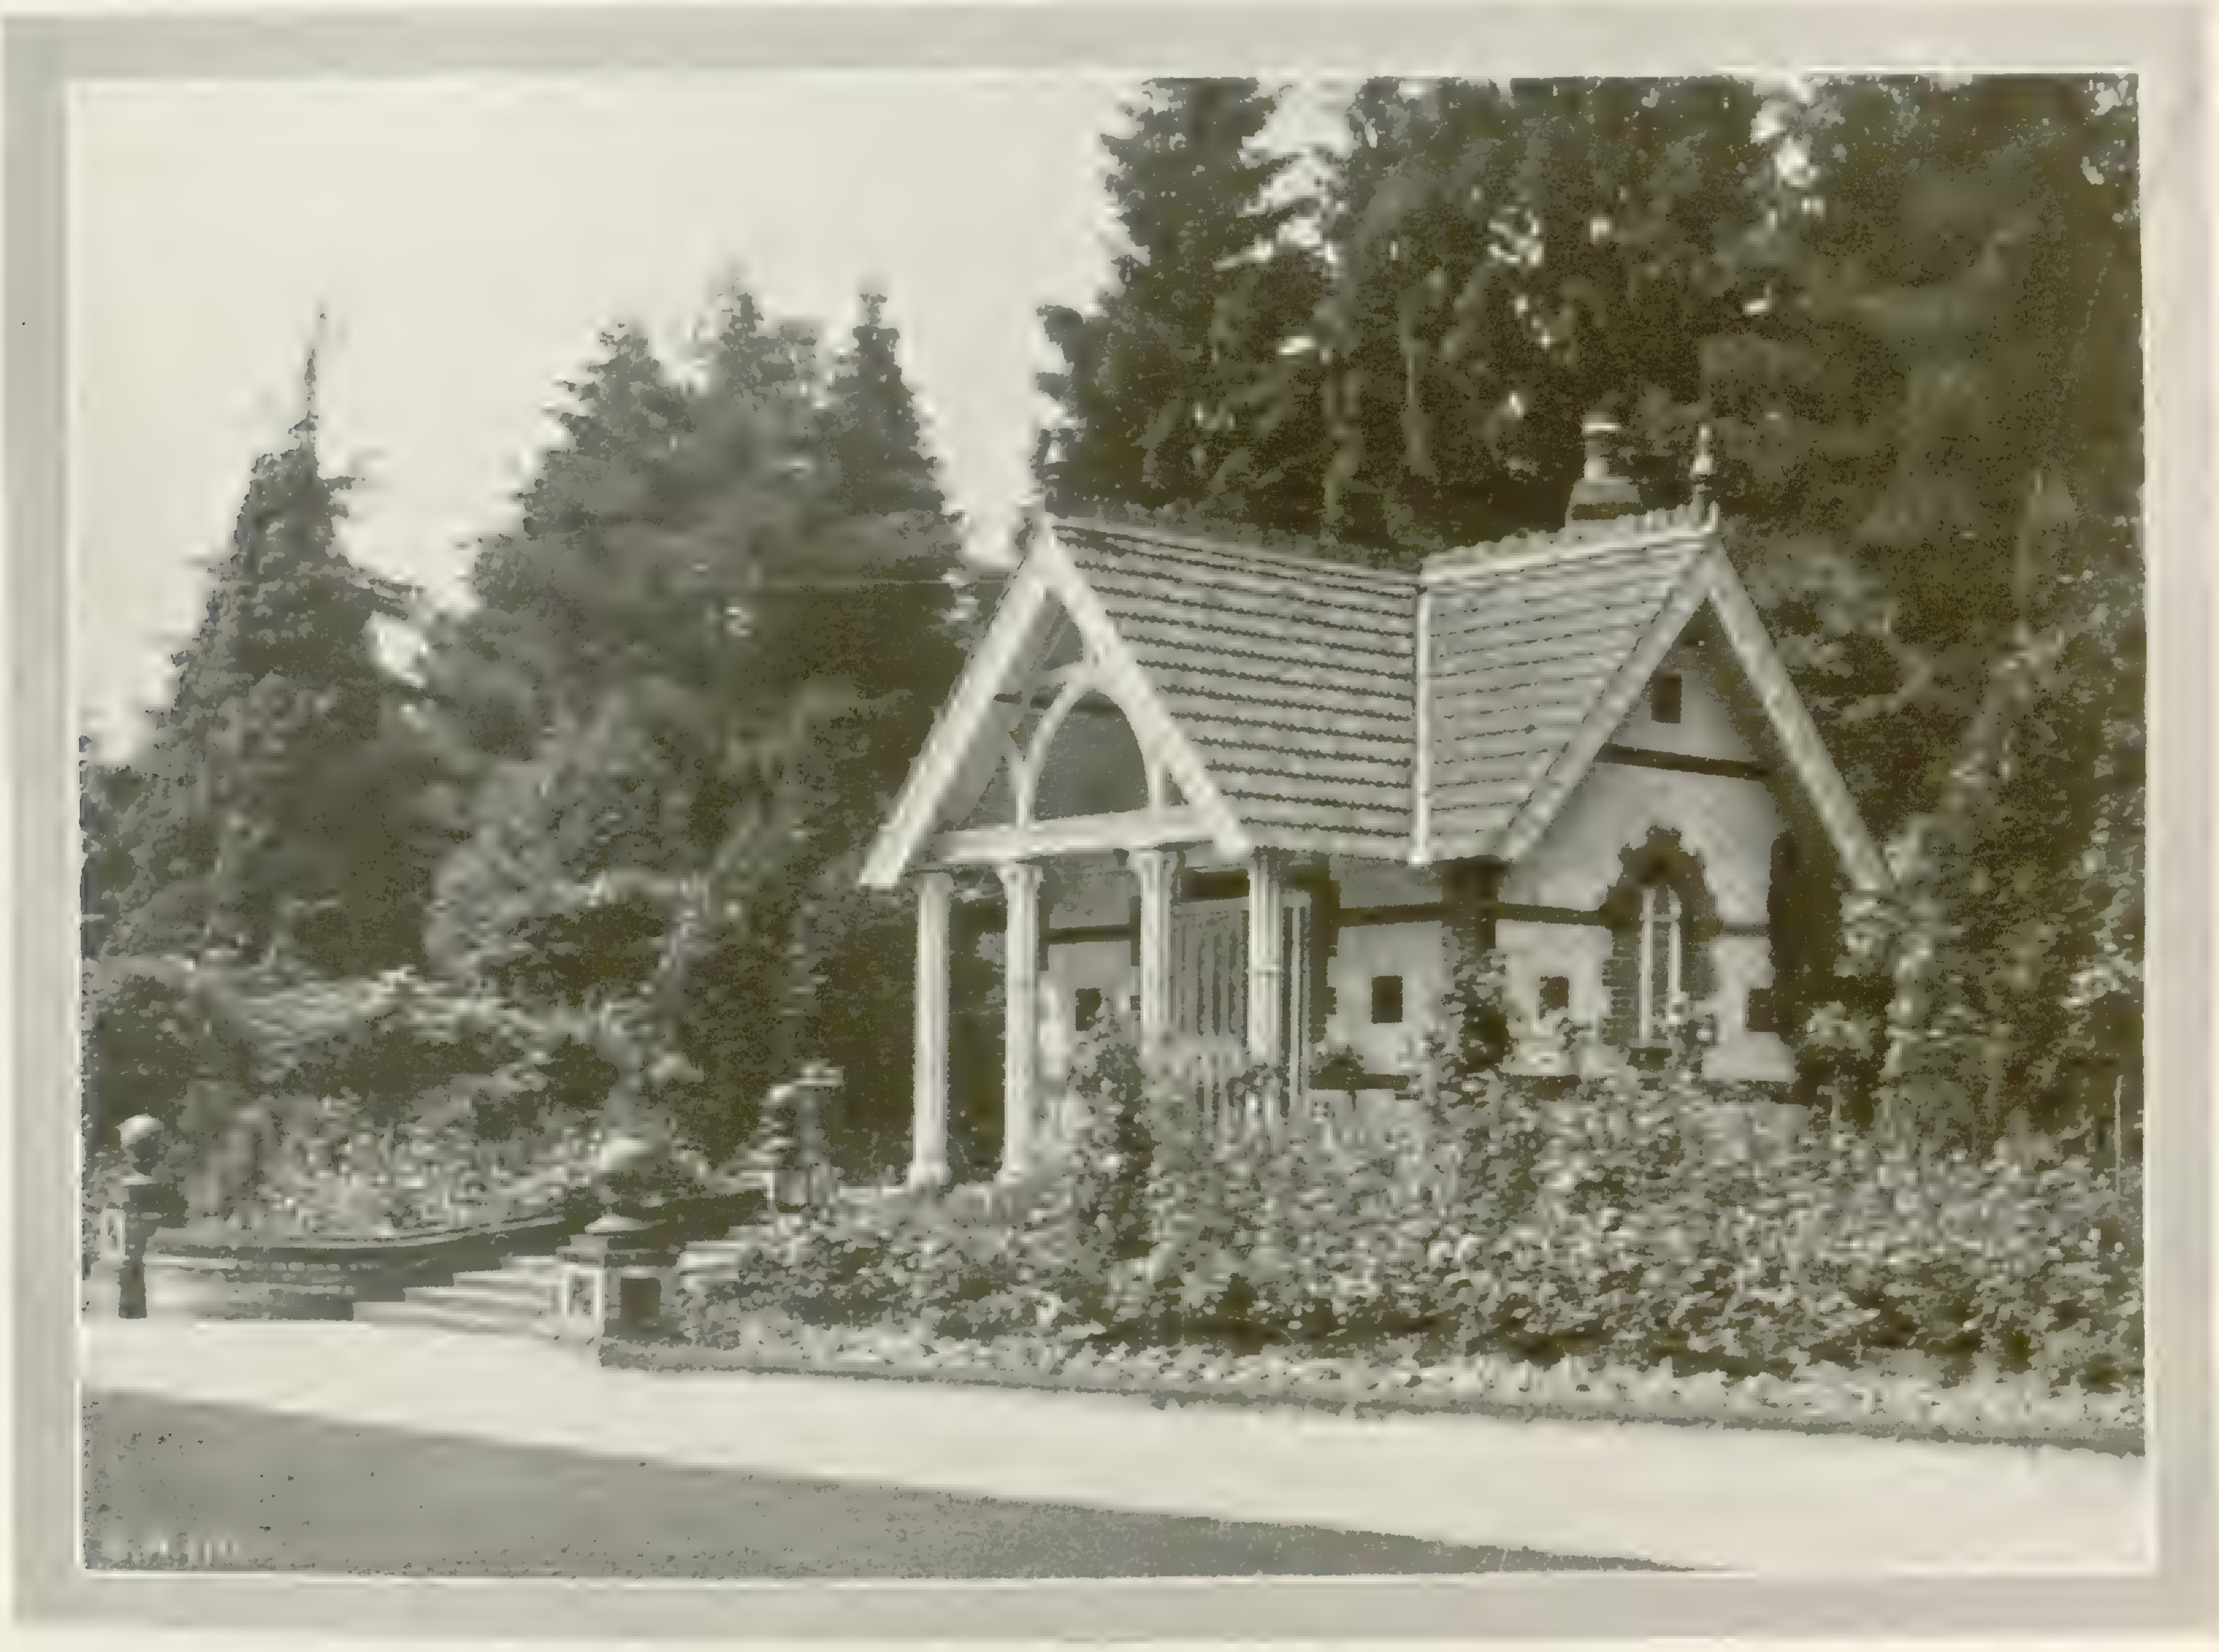
DENDROBIUM RUBENS GRANDIFLORUM.
Flowers rose, purple, and red-purple.

DENDROBIUM RUBENS GRANDIFLORUM.

This very fine, easily grown, and free-flowering dendrobium is by no means new, and therefore it is not an expensive plant. The original D. rubens was raised by crossing D. Leechianum with D. nobile nobilius, while D. rubens grandiflorum is the result of crossing D. splendidissimum grandiflorum with D. nobile nobilius. The difference of parentage is explained by the fact that D. Leechianum and D. splendidissimum have both the same parentage, i.e., D. aureum and D. nobile. Messrs. J. Cypher and Sons, Cheltenham, always grow D. rubens grandiflorum well, as, indeed, they do dendrobiums generally, and the illustration given shows a flowering growth as recently exhibited by them. This fine hybrid has shapely blooms that are richly coloured. The sepals and petals soft rose-purple, heavily flushed, and shaded with bright red-purple, while the broad and rounded lip has a very large central area of dark rich red-purple, this deep colour radiating a little into the paler margin. The Messrs. Cypher were also the raisers of this handsome dendrobium.

A CHARMING TEA HOUSE.

Garden houses are of many kinds, and the various structures that come under notice in gardens that represent the creative powers of past generations of landscape gardeners are of much interest, as showing how widely divergent have been the views held with regard to garden architecture. A century or so ago houses of Italian design were regarded with most favour as a place of rest in the garden; but, although somewhat ornate and attractive in appearance, they had little to recommend them for the purpose for which they were provided. In some cases structures of elaborate design that must have cost large sums of money were in no way more useful as a means of shelter than an inexpensive seat of wood with a suitable cover, and certainly not more comfortable as a place of rest, for but little comfort can be obtained from a seat of stone. As these went out of fashion the rustic summer-house became popular, and, if preferable as a resting-place to the structures they had replaced, they were for a long period so designed as to fall considerably short of what a garden house might and indeed should be. The best of them were pleasant places in which to seek rest and retirement during bright, hot weather, but they were not places to which the owner of the garden or his friends could resort when the weather was not particularly favourable, as, for example, when a keen easterly wind was blowing. Within recent times a considerable improvement has been effected in rustic summer-houses, and as the result thereof those who resort to them are able to so regulate the admission of air as to enjoy an abundant supply of fresh air without exposing themselves to cold draughts and the risks attendant thereon. With a fuller appreciation of the value of the garden as a place of rest and retirement houses of a permanent character are coming into favour. Sometimes they are of wood and sometimes of brick or stone, but the structures that have come under our notice are, for the most part, elegant in design, and well lighted and freely ventilated—points of considerable importance—and they are so arranged that tea can be readily served in them. One of the most tastefully designed and useful of the garden houses that have come under our notice is the one in the gardens of Eridge Castle, the Marquis of Abergavenny's seat, near Tunbridge Wells. This is spacious enough for all the purposes to which a garden house is usually put, and occupies a charming position that commands views of surpassing beauty over the large, finely-wooded park, and contiguous to beds and borders of roses and herbaceous plants that afford a wealth of flowers from early in spring until the autumn is well advanced.



TEA HOUSE IN THE GARDENS OF ERIDGE CASTLE,
The Sussex seat of the Marquis of Abergavenny.

Black Currant Mite.—By the time these notes appear the buds of many varieties of black currants growing in the South will have commenced to open. At this time the mites leave the diseased buds and travel along the branches, and commence their ravages upon the healthy ones. If no preventive measures are taken whole plantations are absolutely destroyed. The bushes should be carefully examined, and all abnormal buds carefully picked off and burnt; branches which are badly infested should be cut clean away with a sharp knife, and immediately consigned to the fire. This destructive enemy can only be stamped out by constant attention for the next two or three months. The bushes should also be dusted over with powdered lime and sulphur early this month, and repeated again at the beginning and end of April.—H. R. Farmer.

ROSE GOSSIP.

While gossiping with some friends about roses the other day this subject came to the front. It started by one saying we did not see the same good John Hoppers and Marie Baumanns now as of old. Several other favourites were quoted, and arguments seemed to prove that these are not so good and striking as formerly.

To my mind the chief reason of this apparent deterioration is the wonderful advance made in the quality of introductions since these old favourites were so far ahead of their compeers. This is confirmed by the few very old favourites found in the winning stands of to-day. True, we have Horace Vernet, La France, Duke of Edinburgh, Charles Lefebvre, Dupuy Jamain, François Michelon, Louis Van Houtte, Duchesse de Morny, and a few more of the older roses still holding their positions in the exhibition box; but the advent of such varieties as Frau Karl Druschki, Hugh Dickson, M. H. Walsh, and Ulster, with heaps between these, naturally detract from the general quality of those once considered so good.

This is the more noticeable with the teas and hybrid teas. Niphetos, Souvenir d'Elise Vardon, Comtesse de Nadaillac, Maréchal Niel, and Catherine Mermet hold their own as well as the cream of the older H. Perpetuals. But there are not many of the rest that have not been ousted by such grand newer varieties as Lady Ashtown, Dean Hole, Earl of Warwick, Alice Lindsell, Charles J. Grahame, William Shean, Pharisaer, Mrs. W. J. Grant, Mildred Grant, Madame Segond Weber, Madame Mélanie Soupert, Lyon Rose, Lady Helen Vincent, Bridesmaid, White Maman Cochet, Molly Sharman-Crawford, and W. R. Smith, which are so far ahead of the majority of teas. Indeed, the wonderfully improved class of hybrid teas may be said to have entirely risen since the introduction of most roses that more than one grower considers to have deteriorated.

Nor do I think our more modern roses are in any way deficient as regards growth, hardiness, or freedom in flowering. If the old roses smelt so sweetly, we can point to newer varieties in Madame Ravary, Lady Battersea, Viscountess Folkestone, and Dr. O'Donel Browne, the fragrance of which cannot be surpassed by the very sweetest of our old favourites. No; I do not think our old friends have lost their original charm or good qualities, but simply appear to a little less advantage because of the sterling qualities so many recent introductions possess.

The plurality of names was also discussed, and I am afraid we got rather warm on that subject. It does seem a pity that raisers should use the same name for more than one rose. Not only do we find the same name in different classes, but even in the same class. We have two Comte de Paris, in addition to a Comtesse; three named Madame Eugenie Verdier, and the same number of Imperatrice Eugenies. Duke of Connaught figures twice, and so does the Duchess; also the Duchess of Edinburgh. Victor Hugo is not sufficient, but we must have two Souvenirs of the same person. Many doubles can be mentioned. Even during the last few seasons these have occurred, and last year we had two Entente Cordiales, and now Pernet Ducher is sending out a second Eugène Boullet!

Then there is much unnecessary confusion with the number of names nearly alike. The quantity of Verdiers, Lacharmes, and Jamains, for example, and the numbers named after certain districts, such as Lyons, Cheshunt, Waltham, etc., to say nothing of the number ending in Rambler. Progress is a climbing tea, with bright carmine, semi-double flowers, while Le Progrès is a short-growing golden yellow. One would think we had exhausted the list of suitable names. Then, again, the great and unreasonable length of several varieties is irritating. Why can raisers not select such as Purity, Beryl, Meta, Peace, Dawn, Sunset, Sunrise, Sappho, etc., or, at any rate, dispense with such double names as Madame Wagram, Comtesse de Turenne, and heaps that exceed this in length?

Then one mentioned he had removed the whole of the material that protected his roses during the past winter. Some declared it was too early, and that the wood needed a little protection as much when the sap was moving as when quite dormant. Another would not protect at all; said he would not harbour delicate varieties when there was such an excellent choice of others as hardy as any of our flowering shrubs. I think he was sensible; but some of us have a fancy for sinica Anemone, Fortune's Yellow, and a few others of the more tender varieties, and it would seem better to give these some little protection—more or less—according to position and locality.

One thing we thoroughly agreed about, viz., that the rose was our favourite flower, and we would meet again for another exchange of ideas. A. P.

Zonal Pelargoniums.—For winter flowering cuttings should be inserted at once, and as soon as rooted pot off singly, pinching them as they grow; and when the weather is favourable expose to full sunshine in the open, and do not allow to become dry at the roots. House them about the last week in September.—W. Staward.

SWEET PEA NOTES.

Sweet peas sown in the open ground during September or October last will now be growing nicely; and, though somewhat early for thinning, yet they should have an occasional hoeing when weather permits, afterwards dusting down each side and between the rows with soot, for, as the ground gets a little warmer and young growth is made, the slugs will be all too eager to sample the tender shoots, and where only a row or two of peas are grown it is quite an easy matter to keep them safe from these pests.

Young plants wintered in the cold frames in pots will be making more growth than those out of doors, and where they are inclined to fall about a few twigs of birch should be put around them to keep them upright. The lights should be kept off as much as possible; in fact, they should never be on except during frost, rain, hail, or snow. I have seen it advised that they should be potted if in small pots, or if several are in a larger pot, but this I have found to be quite unnecessary—in fact, I have wintered sixty plants in a box 20in. by 12in., inside measurement, until early in April, without any of them suffering unduly; but it is really a question of sowing at the right time, and keeping the plants as hardy as possible all the winter through. After February, if the weather is anything like favourable, I should not hesitate to stand sweet peas right out of doors, with an old net over them, and occasionally a mat or tiffany covering on a very severe night.

Spring-sown plants in pots or boxes should now be coming through the soil, and, whether on shelves in the greenhouse or in cold frames out of doors, any degree of coddling must be avoided. Give abundance of air at all times when there is no frost, but should the weather be frosty or cold avoid giving much water at the roots.

Seeds of new varieties being somewhat scarce and dear this last autumn, stocks may be increased by cuttings. Not that these are to be recommended in preference to seedlings, but they are certainly useful as a means of increasing one's stock. It is of very little use attempting to strike cuttings from spring-sown plants, but they will strike readily if taken from autumn-sown plants that have been wintered in a moderately cool greenhouse—in fact, much more readily than when taken from plants that have been wintered in a cold frame. These latter are harder, and when introduced to heat run into growth at once instead of making root, and consequently are not of much use. But, if cuttings are taken from plants that have been in the greenhouse some time, and put in a moderately warm propagating frame, they will root nicely in about fourteen days. My practice is to put four or five cuttings in a large 60-sized pot, using a very sandy compost, and getting the cuttings from 2in. to 3in. in length. These are potted off singly as soon as rooted, and hardened off as quickly as possible, small pots being of course used.

The varieties I have found root most readily are Czarina, Earl Spencer, Anglian Blue, and Carmine, and Lavender George Herbert; but this latter, as well as Silas Cole, Rosie Adams, Apple Blossom Spencer, and one or two others of the very strong growers, are very apt to grow spindly before they root, and therefore demand much care in propagation. For ordinary stock purposes it does not matter much if they do grow away a bit, for they will flower earlier than the seedlings, and consequently are valuable in the matter of seed production, and this is really all I would recommend them for.

Thomas Stevenson.

Woburn Place Gardens.

PEAS.

Peas are a very important crop in every garden, and no vegetable is more appreciated in the household, whether large or small. The first point to be considered is the preparation of the soil, and with reference thereto it must be said that too much importance can hardly be attached to deep working and free manuring. One has only to observe the difference between varieties grown on deeply trenched ground and those on ground that has been merely dug, the yield being heavier and peas superior in flavour on the former.

To grow the peas to perfection trenches should be prepared in the autumn or winter by taking the soil out two feet deep and the same in width, the bottom being broken up and a good layer of well-decayed cow manure spread over the soil. Then partly fill in the trench, and add a good sprinkling of bonemeal, leaving the remainder of the soil to be exposed to the action of the weather, to become sweetened and pulverised. This should be replaced previous to sowing or transplanting. The next thing to be considered is the varieties most suitable, and of these there is a long list. For first early our favourites are Gradus, Early Giant, and Early Morn, followed by Duke of Albany, Centenary, Alderman, and Quite Content for mid season; the last-named is one of the latest introduced, and I consider it the best pea in cultivation, especially for exhibition, as it bears pods seven inches in length. For late crops I am in favour of Autocrat and Gladstone, the first-named being the best flavoured. From the latter we were picking at the end of October last. To keep up a successional supply from May to October, which I am expected to do, I make a sowing every ten or twelve days. The first earlies are sown in boxes at the middle of January, the boxes are placed under glass, and the peas transplanted in trenches towards the end of March. For the main crop we sow outside at the end of March and through April, and so on up to the middle of June.

During a very hot summer peas require a large amount of moisture, both at the roots and overhead, and if neglected in this way they soon die off. During dry weather syringing the rows overhead is very beneficial. Mulching the ground with stable litter is of great help by assisting the retention of moisture, and this helps to save labour in watering. One of the greatest mistakes made in growing peas is that of sowing them too thickly, especially the large-podded varieties. These should be sown not less than three inches apart in the drills. If peas are wanted for exhibition I should recommend a dressing of bone superphosphate on each side of the rows, to be hoed and watered in, as such dressing will increase the size of pods, and bring them into use sooner. By pinching the tops of the leading growths and stopping the laterals or side growths, the development of pods will be accelerated. When gathering peas for exhibition the best time is early in the morning, when the dew is on them, as they will then retain their bloom and freshness much longer than if gathered later in the day. They should be cut with a sharp knife or scissors, and placed in boxes or trays in single layers.

Porters Park, Shenley, Herts.

GLOBE ARTICHOKES.

Though still an esteemed summer vegetable there does not seem to be the same value set upon Globe artichokes as there was even, say, twenty years since. I can well remember the importance attached to this edible collection of vegetables at shows. A contest in the classes for them was considered very unequal were artichokes absent, and the great champions of former days would hesitate an entry if they were not well provided with these globose heads.

To maintain full plantations and vigorous stocks there is need for protection in some form during winter, for, though considered hardy, there are often casualties by the time winter merges into spring. Much, too, depends on the nature of the soil and the altitude of the garden, though even in these matters there are experiences gained that appear to be in conflict with passing theories. I can recall an instance where vigorous and prolific plantations of these artichokes occupied for a long time a situation so low that drainage was a difficult problem, and what made the outlook appear more unfavourable was the fact that a stiff clay formed the subsoil. Despite these apparently unfavourable conditions, artichokes of the very best quality came in regular succession during the summer season, and they not only did their maximum of service in the kitchen, but the records of exhibition successes are not easily forgotten.

Many have of necessity to remember that without some protection their stock of this vegetable is liable to much debility and loss, and steps are taken early in the winter to ensure against it. Some heap up coal ashes around the base of each plant, as these are found not only protective against frost but slugs also, which in some gardens play havoc with the tender crowns. Leaves freshly gathered are the choice of others, while some depend on strawy materials for the same purpose. Individual convenience and adaptation of locality afford the better guide. There are instances, too, where it is unsafe to depend entirely on outdoor reserves. Some stools must be lifted and suitably divided up into crowns that can be potted, or, if a cool frost-proof structure is available, they can be laid in prepared root-forming mediums to await the spring transfer to their permanent site.

It is found advantageous to move the plantation periodically on to new ground, for the constant treading and manuring of the surface, combined with the heavy shade produced by the leafage in summer, make the soil sour and unattractive to their somewhat fastidious roots. It is a fact that in few gardens is there a surplus one can afford to throw away; there is rather an enquiry from one's neighbours for plants that circumstances do not make readily available.

Some are driven to the extreme of seed sowing as a means of augmentation, but, though no formidable difficulty presents itself in providing stocks from seeds, there is a keenly-felt disappointment when, having reached the adult stage, the plants present small worthless heads which neither gardener nor cook can admire. It represents so much wasted time almost invariably to raise artichokes from seeds, and few attempt to repeat the operation. There is in some gardens a mixed stock of these plants, and often one sees the undersized representative—the mongrel—doing duty for the true artichoke, but which, as we have already remarked, give satisfaction nowhere.

The reason for the decline of artichokes in popular favour in the show tent does not readily appear. They certainly represented careful cultivation as much as any other product of the garden. It cannot be said there is a decline of the competitive spirit among vegetable exhibitors compared with, say, twenty or thirty years since; indeed, it is doubtful whether vegetable exhibitions were at any period better or more artistically displayed than they are to-day; but the question that rises in the mind is why the Globe artichokes that in former days were chief among vegetables, should now be so utterly disregarded. That there is still an appreciation remaining in a dietetic sense can be proved easily in the market, for they are largely imported, and meet with a fairly ready sale from vegetable connoisseurs. These imported heads rather confuse the chiefs of culinary departments by reason of their sale in seasons when it is impossible for the British gardener to supply them. Occasions have arisen when orders have been given for Globe artichokes by the kitchen authorities at a season when dry stems and scanty leaves were the only evidence of them in the garden.

W. STRUGNELL.

A TASTEFUL ARRANGEMENT OF BULBOUS FLOWERS

Exhibited by Messrs. J. Carter and Co. at R.H.S. Bulb Show on the 8th inst.

Gardenias.—Plants that are pushing their flower buds may be assisted with liquid manure once or twice a week. Cuttings that were rooted early in the year should be ready for potting, and as soon as nicely established should have the points pinched out. Keep them growing in a high temperature, potting on and pinching them as they require it, and they will make good-sized flowering plants by the winter. It is best to keep young batches of these to take the places of the older plants, as the latter are very apt to become infested with mealy bug or scale, and once either of these pests obtain a good hold they are difficult to get rid of. To keep these pests down, or as a preventive, the plants should be periodically syringed with paraffin emulsion.—T. S.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL REMARKS.—The sun's rays have now become so strong that the root blinds will require to be brought into use during the hottest portions of the day. It is always necessary to use greater care in protecting the plants when the days are lengthening than in the fall of the year; the plants have just passed through the dull season, and are more liable to become disfigured in many cases, or so hardened, in the case of odontoglossums, that the over-ripening causes the leaves to fall, with the result that we have the undesirable feature of leafless pseudo-bulbs. I find that even strong reflected light from snow also has a tendency to cause the foliage to become red. While it is desirable we should at all times secure properly ripened and matured growths, so that the plants may be able to produce their flowers to the best advantage, this must be done without distressing or unduly straining the plants.

PERMANENT SHADING.—Where the blinds do not properly overlap, and at the south ends of houses, a thin coat of permanent shading should be put on the glass. I find that by powdering the whiting finely before wetting it, and then mixing it with skim milk, with a little salt added, the frost at night does not seriously affect it. It may either be applied with the ordinary whitewash brush or sprayed on with a fine spraying syringe. The latter is a quicker way, and with care the work can be effectually done. The sides of the houses may also now be stippled with whiting, although where other material of a portable nature can be provided, such as lengths of shading suspended by hooks, which can be easily removed when not required, it gives some advantage at this early season.

ATMOSPHERIC MOISTURE.—The life of most epiphytal orchids depends on the atmospheric conditions. We are liable to place a considerable amount of stress upon the suitable potting composts for the different kinds of orchids, and I am perfectly willing to admit that there is considerable advantages derived from providing the plants with compost to suit their requirements; but unless this is accompanied by suitable atmospheric conditions it will avail but little. It is no easy matter, and one that requires the careful consideration of even the most expert orchid cultivator, to provide such conditions of atmospheric moisture as may safely be afforded according to the frequent changes of the outside atmosphere and temperature. Plants of the cattleya family, which perhaps suffer more than any other orchids from the excessive use of artificial heat, depend almost entirely on atmospheric moisture to keep their pseudo-bulbs plump during the resting season. Care should be observed not to damp or spray the plants until the normal temperature of the house has been reached, and it should also be done sufficiently early in the day to permit of its becoming evaporated before the night temperature is reached. The cool divisions, especially where ventilated freely, will now require to be damped on the floors, etc., twice a day. Spraying overhead in this division should also be done early to permit of the plants becoming dry before nightfall.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PROPAGATION.—Many of the cuttings put in as advised in a previous calendar should now be well rooted. They should be removed from the propagating frame, but not until they have been gradually inured to a little air. On their removal it is a good plan to stand them among the plants on the stage for a few days, where they will be sheltered from the sun and air somewhat. Keep them sprayed overhead to prevent flagging, and, as soon as they can stand it, remove them to a shelf near the glass, or to a more open stage, where short growth may be made.

CALADIUMS.—The main batch of these plants will now be growing, and no time should be lost in having the corms shaken from the old soil. Where small plants in 48's and 32's are required for decorative purposes single corms potted up will do well, but where large specimens are wanted then several good large corms should be put into large pots or pans, and it is wise to pot them straight away into the pots they are to remain in, as the beautiful foliage requires very careful handling. Although caladiums like plenty of water, they are very liable to suffer if anything approaching stagnation occurs, so a very light, but fairly rich compost should be prepared for them, consisting of equal parts of fibrous loam, peat, leaf-soil, and sand, with plenty of charcoal and well-dried cow manure added. With this compost, and the pots or pans well crocked, caladiums should make a fine show in the stove for several months.

BEGONIAS.—A batch of cuttings of the various varieties of the Lorraine type should now be put in, choosing cuttings that are coming up from the base of the plant, these making the strongest and bushiest plants. For a later batch of cuttings a few plants should now be put into the stove, and they will not be long before they throw up growths. In addition to Begonia Gloire de Lorraine we have now a choice collection of large-flowering hybrids, chiefly introduced by the Messrs. Veitch. These will be going out of flower, and should be partially cut down and rested before proceeding to propagate from them. Two very handsome foliage begonias for the winter are B. Gloire de Sceaux and B. Haageana, and these, if propagated shortly, will make fine plants by the autumn. All the above should be rooted in a brisk bottom heat, using a very sandy compost and potting them before the roots attain any great lengths.

SEEDLINGS of gloxinias, begonias, streptocarpuses, etc., must be carefully looked after, and if on shelves must be carefully shaded from the sun, as even an approach to dryness will seriously check them; as soon as large enough to handle they must be pricked off, and it is surprising how much more quickly they seem to grow when put into fresh soil.—Thomas Stevenson, Woburn Place Garden.

FRUITS UNDER GLASS.

STRAWBERRIES.—Plants swelling their fruits should be placed near the glass upon shelves, and may, in order to hasten the ripening of the crop, be subjected to a temperature of 65 to 70 degrees by night, and 75 degrees by day, from fire heat, with an increase to 85 to 90 degrees from the sun's warmth, if it is accompanied with careful ventilation. Under these conditions, and with a view to keeping down red spider and assisting the swelling of the fruit, the plants should be well syringed in the morning and early afternoon. Careful attention must be paid to watering; discreetly give weak farmyard liquid or an occasional light dressing of a suitable artificial compound. Thin turves placed beneath the pots, when they are first arranged upon the shelves, lessen labour in watering. Once the fruits commence to colour keep up a gentle circulation of air through the house, and thus slightly lower the temperature; discontinue syringing and the use of manures. Attend to successional crops in the way recommended for early ones in a previous calendar.

LATEST PEACH HOUSE.—This house should be closed as soon as the trees commence to blossom, but if ordinary weather prevails no artificial warmth will be necessary. Here, however, fire heat has at times been used in order to keep the blossoms from being frozen. During the blossoming period promote, by careful ventilation, a mild circulation of air through the house, but avoid cold draughts. Bees are usually at this season of the year instrumental in perfectly setting the fruit, otherwise artificial means have to be resorted to for the purpose. After the blossoms fade well syringe the trees daily when the weather is favourable.

FRUITING PLANTS OF QUEEN PINE-APPLES.—Maintain for these a night temperature of 70 degrees, with corresponding rises by day, and, while they are in blossom, a fairly dry atmosphere. Remove gills from the fruit stems and all suckers from the plants, as it will be best for several reasons to reserve a selection of later-formed suckers for propagating purposes. As soon as the flowering period is over support the fruits in an erect position by stakes placed firmly in the plunging material, and increase the atmospheric moisture by damping available surfaces several times daily and by spraying the plants overhead on sunny days after the house is finally closed. Be careful to keep the soil moist, but by no means very wet, and by way of stimulant just discolour the water with Peruvian guano at each watering.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

LETTUCE.—Those sown last autumn and wintered in rough frames can now be successfully planted in a warm and sheltered spot. If good endive is not plentiful a portion of the forward lettuce plants should be planted in rich soil in a cold frame, and every inducement given to hasten the growth by spraying lightly on fine days, and closing the frames early to conserve all the possible sun heat for the night. Stanstead Park is an excellent lettuce for this mode of culture, besides being one of the hardiest varieties. Those raised in heat should be pricked off as required. Make further sowings in boxes of Sutton's Supreme and Little Gem.

VEGETABLE MARROWS.—These are highly appreciated, especially when an early crop can be obtained. Sow the seeds singly in small pots and place in a temperature of about 60 degrees. Shift into 48-sized pots as growth proceeds, and later on plant out on a mild hotbed in a firm compost of loam, spent mushroom bed material, and a little mortar rubble. Other plants can be put into boxes, and trained up the trellis of an intermediate house, where space can be spared. To secure a good set of marrows the fruits must at this season be fertilised daily. Pen-y-byd and Moore's Cream are very fruitful varieties for early crops.

ONIONS.—No time must be lost, whenever the ground can be brought to a good tilth, in sowing the main crop. Much can be done by strewing the site, if wet, with a good dressing of burnt garden refuse direct from the burning heap, and soot and dry soil from under the potting bench. When applied proceed to fork over the bed lightly, breaking up the lumps and levelling as evenly as possible. If the plot is now found to be fairly dry on the surface lightly tread the bed over, rake down, draw off the large stones and rubbish, and sow the seed in shallow drills drawn one foot apart. After covering the seeds lightly use the wooden rake to finish off with, this being preferable to an iron one, as it leaves the surface in a rougher state, and there is no danger of a caked surface to hinder the growth of the seedlings. Main Crop, Improved Reading, and Long Keeping are good varieties for a continuous supply.

CELERY.—About the middle of the present month the main batch should be sown in boxes placed in a very gentle heat. If preferred, the seeds can be sown thinly on a mild hotbed under frames. The early seedlings will require to be pricked off into boxes and kept growing in gentle heat. Guard against any checks. Celery still in the ridges can now be lifted and placed in ashes, in an upright position, under a hedge or wall facing north; this will give a check and prevent the advance of flower stems for a long time.

POTATOES.—Plant another batch in the skeleton frame for succession. A few may be planted on a south border between the rows of peas. Sow small quantities of spinach, turnips, and radishes.—G. Ellwood, Swanmore Park Gardens.

Full Instructions on Planting and Propagation of Hardy Plants and Flowers.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6**

Some Features of the Work :—

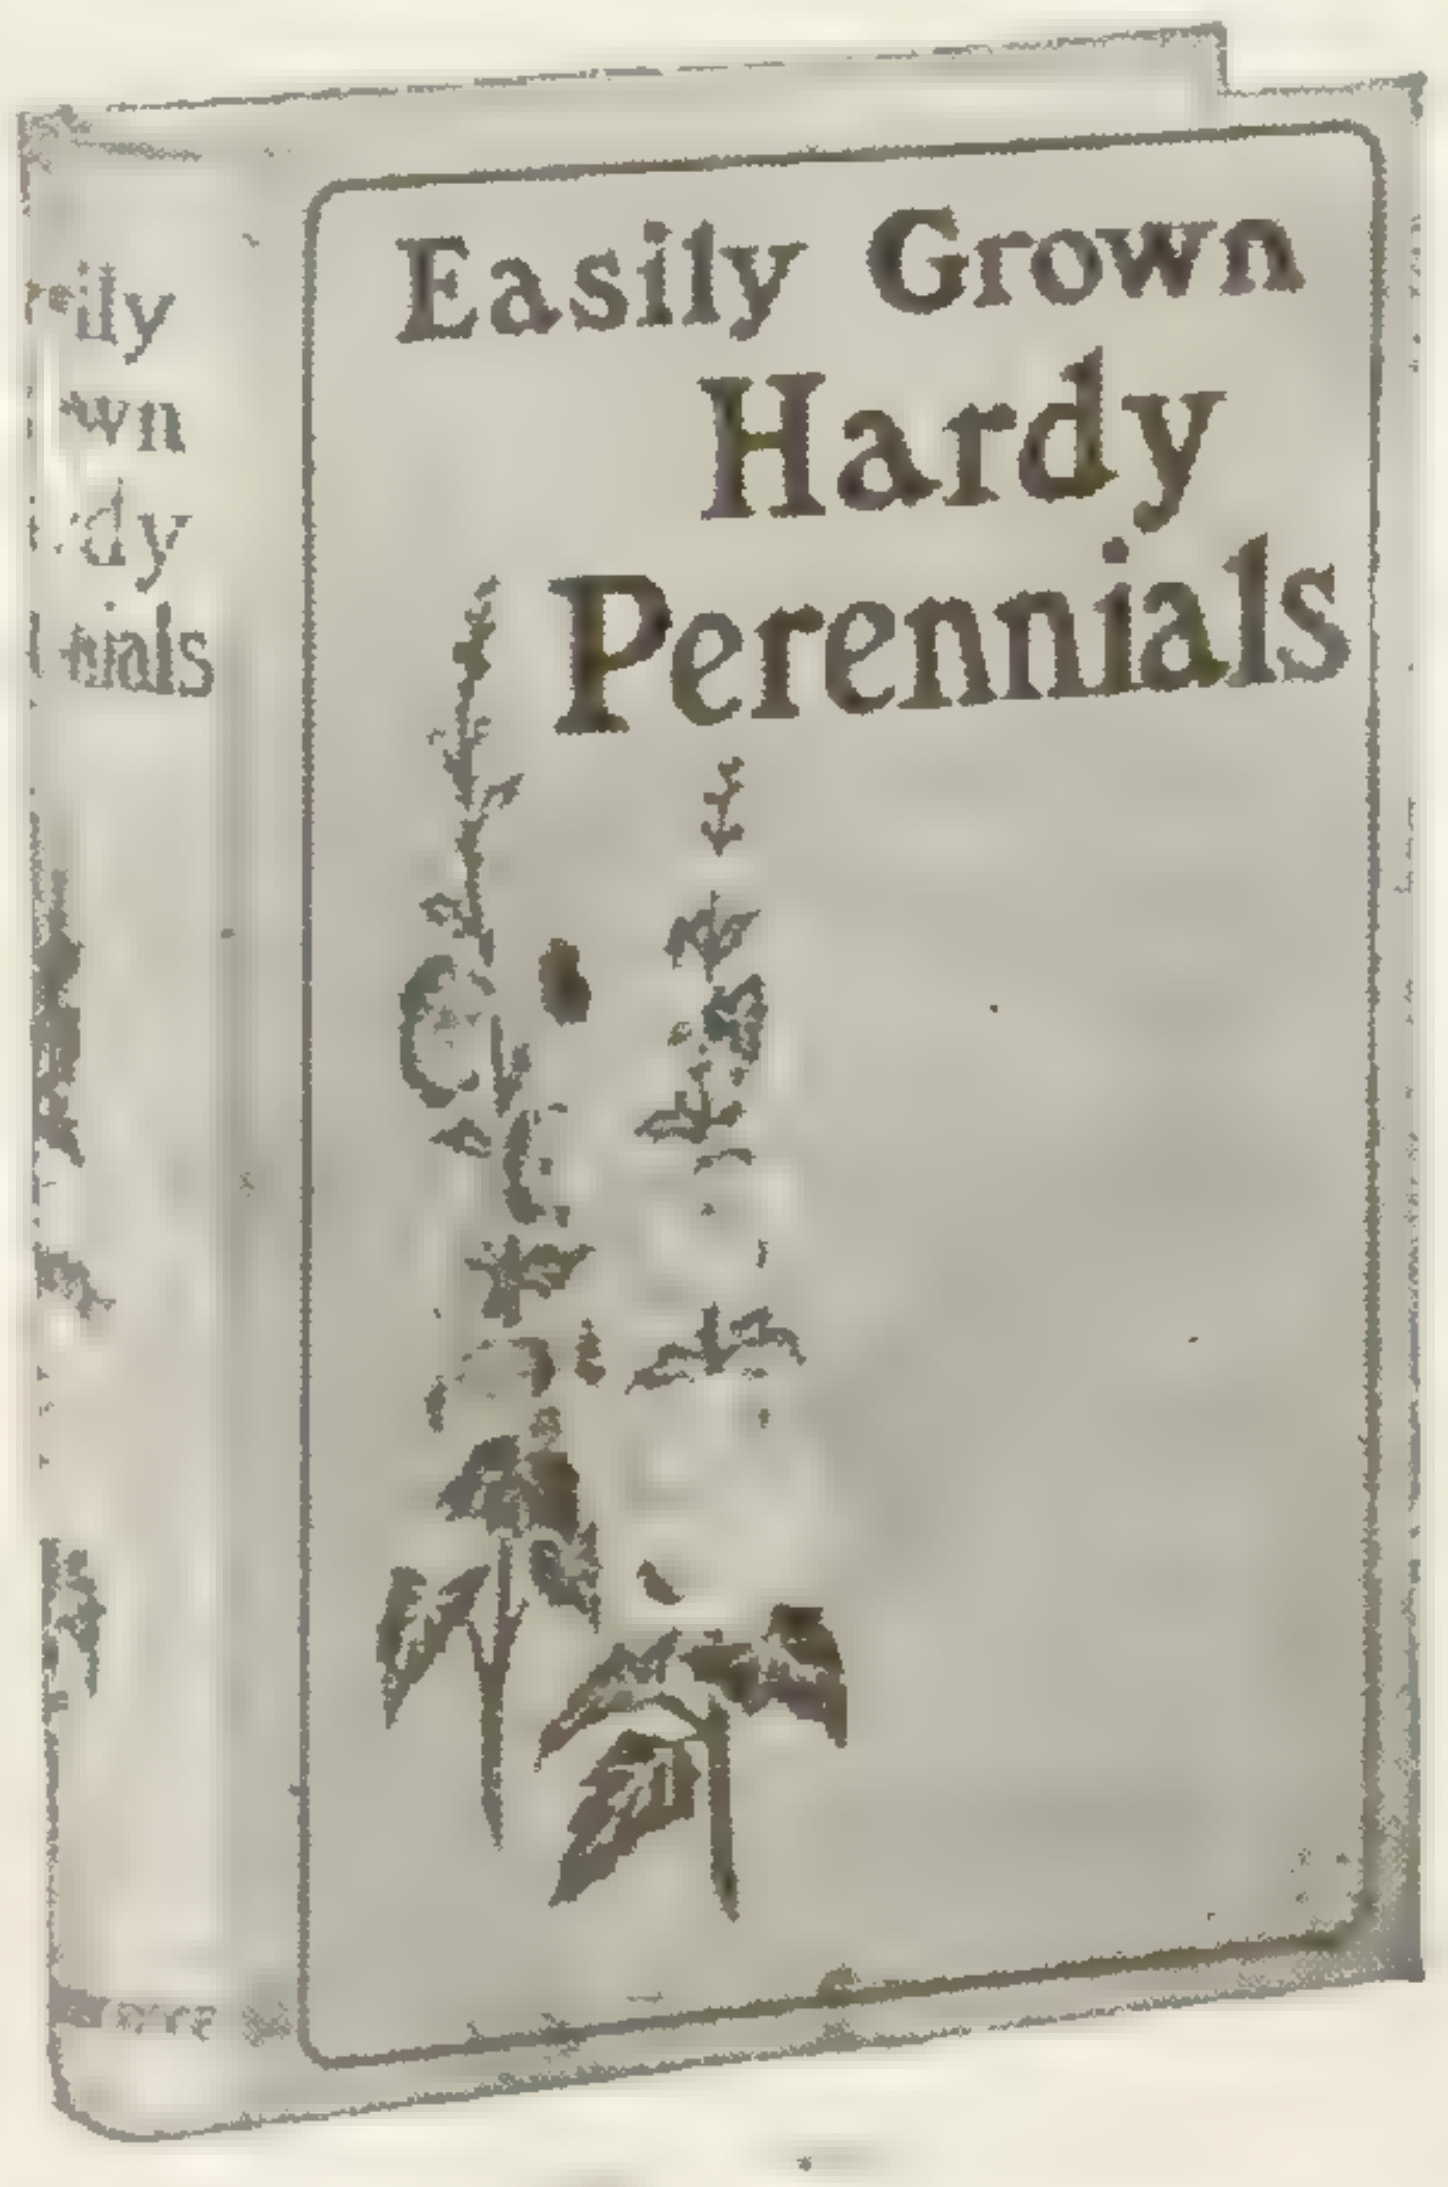
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth.

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.—Gives the botanical or generic name of each genus of plant described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

The first conference held under the auspices of the National Dahlia Society since its absorption of the London Dahlia Union, was held on Friday, March 4, at Carr's Restaurant, Strand, W.C. Mr. Edward Mawley, V.M.H., presided, and opened the proceedings a few minutes after six o'clock.

Briefly, Mr. Mawley reviewed the history of the dahlia, the introduction of the several sections into which the flower is divided by florists. He referred to the great diversity of form and colour possessed by the flower, and said that it was popular because it was at its best in the autumn, when most other flowers were fading. The conference was, he thought, necessary, especially as it was many years since a dahlia conference was held. There was a danger that in the efforts to improve dahlias for exhibition purposes they had overlooked the value of the flower for the purpose of garden decoration.

Among those present we noticed Mr. and Mrs. Stephens, Mr. Gordon, Mr. Stredwick, Mr. J. B. Riding, Mr. S. Mortimer, Mr. Wyatt, Mr. J. T. West, Mr. Hawes, Mr. Doncaster, and a considerable number of amateur members, both ladies and gentlemen. Altogether there were over fifty present.

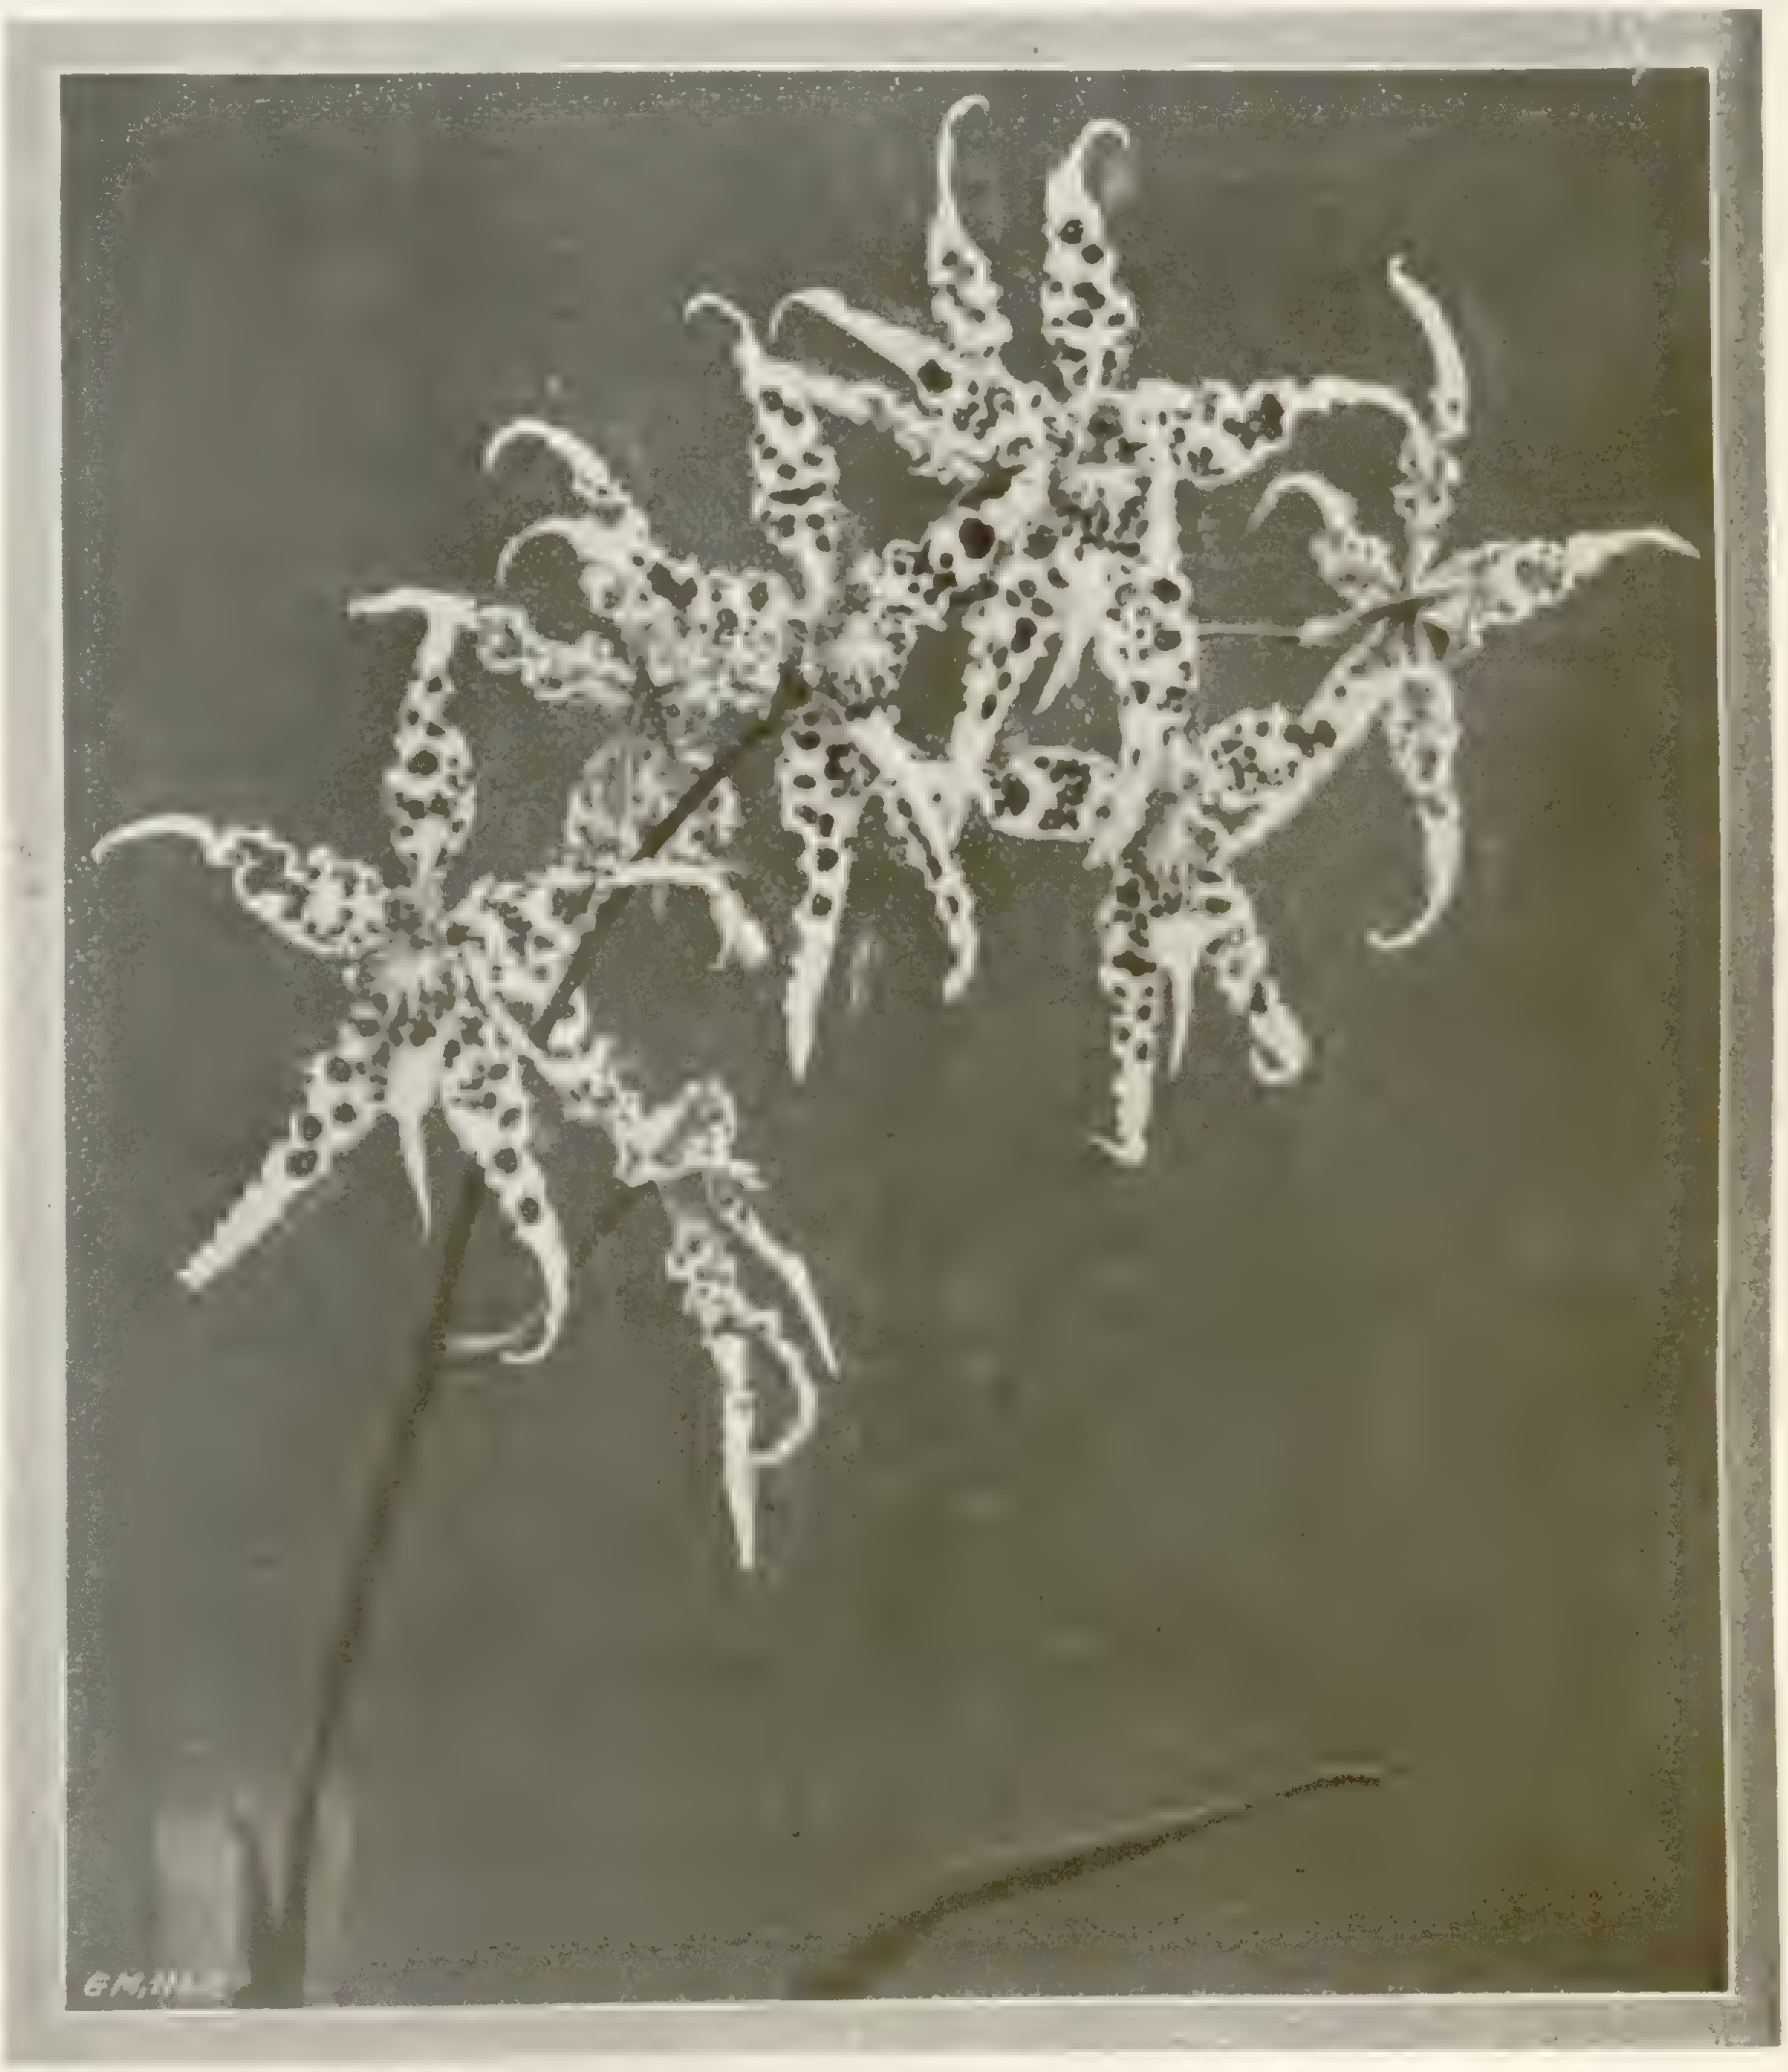
The first paper was read by Mr. George Gordon, V.M.H., Editor of The Gardeners' Magazine, and his text was.

DAHLIAS IN GARDEN DECORATIONS.

Considering that the centenary of the introduction of the dahlia into Europe was celebrated a quarter of a century ago, and that the National Dahlia Society has been engaged in holding exhibitions and making awards to novelties for a long period, I feel in a somewhat strange position in addressing you this evening with "Dahlias in Garden Decorations" as my text. However singular it may appear that the subject should at this late period in the history of the flower have a place in to-night's programme, there can be no doubt that the time has come when we who take an active interest in dahlias should pause for awhile and endeavour to devise some means for bringing the immense value of the flower, in its diversity of form and colouring for beautifying the flower garden, into greater prominence. We should not only consider this point, but should make strenuous efforts to show the flower-loving community in the clearest possible manner the lines they must follow to have in their gardens the wondrously beautiful displays dahlias are capable of producing.

Before we can make any real advance in the endeavour to place the dahlia in the position it should occupy among the many plants available for beautifying the flower garden during the summer months, we must break away from traditional methods, and make very considerable changes in our views with regard to the methods of procedure by which the best interest of the flower can be served. We must first of all recognise the fact that all the dahlias in cultivation are not, for some reason or other, suitable for garden decoration. The majority of those whom I am addressing will probably feel within their own minds that this fact is well known to those who are well acquainted with dahlias. Just so. The experienced grower knows well enough that only a small proportion of the varieties in one or two of the more important sections can be successfully used for the embellishment of the garden, but the general body of amateurs do not. Hence I regard it as of immense importance that we, as a society, should give increased attention to garden varieties; for, unless this is done, neither the society nor the flower will enjoy to the full the popularity we could wish.

The society has been in existence many years, and has conferred distinctions upon an immense number of varieties, but not until the past year or two have awards been made to varieties specially shown for their usefulness in the garden. The individual blooms have alone been considered in the making of awards, and, while this is the best method in determining the fitness of varieties for the exhibition board, it fails altogether as far as garden decoration is concerned. Under such an unsatisfactory system it is not surprising the raisers should have devoted their attention almost exclusively to the development of the individual blooms, with the result, in the case of the cactus varieties, that comparatively few are of any considerable service otherwise than for exhibition, and the cult of the dahlia put back many years. I am hopeful that, with the change in the policy of the society in the granting of certificates, raisers will devote more attention to habit and freedom of flowering, and that we shall as a result have at our command a race of cactus varieties possessing those qualities that will justify their receiving a more prominent position in beds and borders.



ODONTOGLOSSUM CRAVENIANUM.
A beautiful hybrid exhibited by Messrs. Charlesworth and Co. at R.H.S. Meeting on the 8th inst., when it received an Award of Merit. Flowers white, spotted with chocolate-purple.

I am anxious to see them prominent because of my appreciation of the value of free-blooming and effectively-coloured varieties in mixed borders as well as in beds and groups. Within recent years mixed borders have become a great feature in the gardens of all classes. Sometimes these borders are filled with hardy herbaceous plants; in other cases half-hardy plants are associated with them, and in some instances the last-named are alone employed. Dahlias are herbaceous, but not hardy, yet the value of varieties that are really suitable for the garden is so great that there is not a border in the United Kingdom that would not be immensely enhanced by the inclusion of a selection of the best. Yet they are almost everywhere conspicuous by their absence. During the past three years I have had opportunities of seeing between fifty and sixty of the best gardens in this country in which mixed borders are great features, and not in half a dozen were dahlias represented. In more than one instance I made some enquiries with regard to their exclusion, and the reply in several instances was to the effect that they had been banished because of their having made such rampant growth that the few flowers produced were hidden, and that but dense masses of foliage met the eye. In these cases the mistake was made of assuming that the cactus dahlias only are suitable for the purpose. For a considerable period they were described by writers who knew but little about them, as the best of all for decorative purposes, hence the mistaken views that obtain in some quarters. As a matter of fact, there are varieties in all the sections that are singularly effective when grown under the conditions favourable to flower production, and they should be utilised as far as space and position will permit. There is no period of the year when the gardens of country houses of the wealthy are more fully enjoyed than in August and September, and, as the mixed border begins to show signs of waning in the first of the two months, the dahlias are most useful as an aid in maintaining a procession of flowers until the frost comes and ruthlessly makes an end of tender vegetation.

It we would give the garden dahlias an opportunity of displaying their capacities for flower production we must break away, to some extent at least, from the traditional cultural methods. We should, in the first place, impress upon our mind two important facts. One is the short period over which our summers extend, and the other is the necessity for the plants having sufficient time to reach the flowering stage. We know that the best period for dahlia shows is the first two weeks in September, but the garden varieties should be in full bloom early in August. If they are not, they will fail to fully justify the time and labour bestowed upon them. It is surprising what a difference an increase in the length of the season makes in flower production, and, as bearing upon this point, it may be of interest to mention that when we escape frosts until November is well advanced strong-growing cactus varieties that are regarded as worthless for the garden will, if occupying sheltered positions, become so enveloped in flowers as to produce a rich display of colour for several weeks.

We cannot, it need hardly be said, do anything to extend the season by protecting the plants at the end, but we can do much to lengthen it by commencing sufficiently early to have strong plants for bedding out at the end of May. Thousands are annually put out with stems that, if larger than knitting needles, do certainly not exceed in thickness an ordinary lead pencil. Plants of this description represent a loss of nearly a month, or about twenty-five per cent. of the whole season. It matters not whether the stock be raised by means of cuttings or division of the tubers, they should be well established in large 60's by the middle of April at the latest, and be then shifted into 6in. pots, and a compost consisting of turfy loam and well-rotted manure used. Either method of propagation will give good results, but plants raised by division of the tubers will come into flower at an earlier period. If the stock is purchased the plants should be obtained at the period mentioned above, and after a day or two's rest be shifted into larger pots, precisely as advised for those home raised. Subsequently to the repotting they should be placed in a frame, where they can be near the glass, have protection from frost, and enjoy a free circulation of air in fine weather. Plants so raised will grow away vigorously, and come into bloom far in advance of those kept in 60's until bedded out. When advocating this system I am frequently met with the objection that the space available will not admit of more than a few being grown. The only proper reply to such objections is, if there is only a space for a few, grow only a few and destroy the others. A dozen strong plants are certainly preferable to six dozen weakly ones.

With regard to soil preparation, it cannot be too distinctly stated that the heavy dressings of fat manure that are so frequently recommended for beds and borders are both unnecessary and undesirable. The soil should be deeply dug, and a moderate dressing of manure applied, but more liberal enrichment will promote soft growths and hinder the production of flowers.

Mr. S. Mortimer emphasised the fact that almost all the varieties of show and fancy dahlias were of immense value for garden decoration, if grown in good but not very rich soil.

Mr. Wyatt urged the tying out of the growths of dahlias grown for garden decoration, and the removal of the low, late, and sappy growths. It was a great advantage to keep the growth to a few only and tie them to one central stake.

Mr. J. T. West considered that the gross cultivation of dahlias was answerable for a great deal of the condemnation of the flowers for garden decoration. He further agreed that the show dahlia was one of the best for garden decoration. The cactus dahlia was the greatest sinner from the decorative point of view, but he believed that in a few years the section would be greatly improved in this direction. He considered the dahlia had been a brilliant success among florists' flowers.

Mr. Stredwick thought if as much attention was given to a dahlia as to any other florists' flower, equal success would follow.

Mr. Stephens said amateurs should not expect to be able to produce flowers such as the experts stage, in their first attempt. He regretted the introduction of so many fine textured and needle-pointed varieties of cactus, that needed so much special care and protection. He thought raisers were making a mistake in raising so many of these comparatively delicate varieties.

Mr. Mawley rounded off the discussion, and referred to the usefulness of single dahlias for garden decoration.

The second paper was by Mr. J. W. Stredwick, who dealt with "The Culture of Exhibition Dahlias." Mr. Stredwick has been so successful with cactus dahlias that his instructions should be very carefully considered by those who propose to become competitors.

THE CULTURE OF DAHLIAS FOR EXHIBITION.

The principal object of this short paper is to aid those who are anxious to learn the best means of growing cactus dahlias for exhibition, and in the first place I wish to warn those who believe that the best method is to grow from old tubers, because from my own experience, although you may get quantity, one rarely, if ever, gets quality, for the blooms grown in this way come shallow, with a few rows of petals and large, open centres.

If you are to succeed on the exhibition table the best plan is to get good strong, healthy plants, well rooted, about the end of April or the first week in May, when, if purchased from any trade grower, they should be in what is known as small sixty pots. When received, if the pots are well filled with roots, they should be at once shifted into, say, five or six inch pots, acording to their size and condition, at the same time taking great care that the soil is suitable, and not too wet or too dry, and after repotting also great care must be taken not to overwater the plants, or they will soon become sickly, and practically never recover, however much care is then taken. Now, in giving advice to anyone who has not the means or the opportunity to carry out that advice, seems of little value, yet at the same time I can only advise, however difficult it may be to carry it out, and will give the simplest advice I can.

I have already told you what to do on receiving your plants, and when they are repotted the best simple plan is to put them into an ordinary garden frame with a little heat by night, and kept fairly close by day, and shaded for two or three days from the sun until they are to some extent established in the new soil, then the more air you can give them by day when the weather is warm and suitable the better, but on cold days great care must be taken so that air is given without risk of a sudden check to the plants, and by night the frame should be closed, and as the weather becomes more genial the frame should be gradually left open at night until no cover is given before planting out. I would also mention that in some cases perhaps a second shift would be required if the season for planting out should be a late one, but let me also warn against letting a plant get pot bound, or over potting, which perhaps is the worst of the two evils.

Now as to planting out; the first question usually asked is as to what kind of soil is best suited for growing dahlias, and I have at all times, and many times given this answer. I have never found any reasonable soil out of which I could not grow a good cactus dahlia, but the principal thing, which is often left to the last and least thought of, is the preparation of the soil, and I can only give you our own method, and although we never get anyone to believe this, yet it is a fact that much of our soil is among the worst naturally that is upon this earth, yet we succeed to some extent nevertheless.

Now instead of leaving your ground, as many do, until just before planting out time, and then all at once become very anxious about its preparation, get it dug deeply, eighteen inches deep if you can, and the rougher the better, in the late autumn, and let it lie exposed to all the winter weather, and then early in March if possible, put on a good coat of stable manure, and dig it over with a new tool as deeply as you can.

About this time we usually have frosty nights so that all the clod smashing is performed by natural agency, we then turn the soil again about three times before planting out time, the first week in June. If this process is followed, the soil, whatever its composition, should be in first-class condition by that time.

The soil having been properly prepared and made ready as before described, then get ready for planting out. Stretch a line in the direction of your first row of plants, and about two feet from the edge of the pathway, put in a small stump and then repeat this about four feet apart; these will be the positions for your plants to occupy; around the points so marked dig out evenly holes about fifteen inches in diameter, and a good spit deep, fill the holes half full of good, fairly rotted stable manure, with about as much scot as a 60's pot will contain, and the same quantity of well-slaked lime, but fresh; next widen the diameter of the hole by digging in and thoroughly mixing the surrounding soil with the manure, etc., fill in with soil originally excavated, and press it all down evenly. The first row being now ready, the others may be prepared in the same way, leaving five feet between the rows at least; then taking a trowel, dig out a hole large enough to take the ball with the soil as it leaves the pot; put in the plant, replace the soil necessary, and press down firmly.

The dahlias at the time of planting out ought to be about a foot high, and these should be at once secured by putting in a strong stake, not less than four or five feet out of the ground, and tying the plant securely, but not too tightly to the stake.

Now if the weather be favourable, the plants will soon begin to show signs of growth, and most likely buds, the latter, if exhibition is your object, must be at once pinched out, and if the plants be of sufficient height, one or two joints below had better be removed; at the same time, all the strength will be thrown into the bottom growths, which will soon require to be looped up to the stake to protect them from the wind. It is now advisable to put to each plant two more stakes, as the one previously put down, the three forming a triangle around the plant; around the stakes put some stout yarn, to which, when of sufficient length, the branches may be tied evenly all round inside the enclosure; in the case of bushy plants, thin out the weakest branches leaving about six to each plant.

Unless the weather is very dry they will not require watering at first, but in this matter common sense must be exercised, but on no account over-water a plant when just planted out, or the young roots will be rotted, and recovery will be slow; at the same time, take care that your plants are not dry before they are knocked out of the pots, or you will find it difficult to wet the ball after without excessive watering; on the other hand, do not water your plants and then immediately turn them out of the pots, which is likewise a bad practice.

It is more than likely that the early buds, after the treatment before mentioned, will be too early for the shows, except in late districts or early shows, and if it is desired that the plants should have all the vigour possible at the most important time, take out the leading bud in each shoot, bearing in mind this most important fact that from the time this tiny bud is formed, a month must elapse before it can develop into a perfect flower. Do not make a mistake and have half-developed flowers on the show morning.

Now, first a word on disbudding. As soon as it has been decided to let the plants continue to bear blooms, take out all the side shoots and buds, except the centre buds, for three or four joints downwards, leaving the lower laterals to produce future blooms. We never take out any of the lower shoots which, as the season advances, generally bear the finest flowers.

Watering and feeding are other important points upon which it is very difficult to advise, because seasons and climates differ so much. However, the cactus dahlia is a water-loving plant, and it is therefore better to give freely than not enough.

As the plants increase in height, they require great care to keep them secure from the wind. A grower may think his plants safe, but admit they are a bit loose, but he will attend to them to-morrow. Sometimes to-morrow is too late, and before to-morrow's dawn a gale has practically ruined the whole year's work and hope. Always remember a stitch in time saves nine. Constantly give a tie here and there, and safety is assured. Again, as the plants advance and begin to bear a good number of blooms, they will want something more than clear water. It is an excellent plan to get, say, a forty-gallon cask, and put into it a bag containing good rotted stable manure, keeping the cask filled with water and never watering from a water main or pump direct, the water from which is always much colder than the open air. Renew the manure from time to time, using different kinds if possible.

Mulching is often an important matter. It is a great advantage to us in dry weather, but whether it is of value in all climates is open to question, because the sun's rays are thereby prevented from penetrating the soil to a great extent. We do it here in dry seasons as soon as the three stakes are put in, placing a layer of rough stable manure over the ground to a depth of about two inches. Artificial manures, which are many and varied, are often of great value in the hands of those who know how to use them, and sometimes work wonders at the critical moment; but I should advise beginners to use them with the greatest caution, never allowing themselves to be persuaded that animal manures can be entirely dispensed with.

Shading, if properly carried out, is of great importance in all weathers. In very bad weather we cannot get perfect flowers without some protection, but it must not be forgotten that the blooms must always be tied firmly, so that they are in the centre of the shade, and not too close to it, but so placed that a current of air can pass through, otherwise the shade will do more harm than good at times when the sun is hot. As to the shade itself, we make our own from fine canvas or calico; the shade is conical in shape, about twelve inches in height, and the same in diameter at the base, around which runs a wire; a cane of five feet in height is pushed into the ground about nine inches, the shade being fixed to the cane by means of a wire at the top, and the one around the bottom, and at a convenient height to cover the bloom. At this point I wish to mention how inadvisable it is for exhibitors to grow a large number of varieties, and only one or two plants of each; those who do this will often find they are burdened with work, and that when blooms are wanted for competition they have not enough blooms of some varieties. Suppose, for example, that the desired class is one of nine varieties, three blooms in a bunch, it will be found that more than one good bloom from each plant on a given day can seldom be depended on. Rather obtain a selection of good reliable sorts in number according to the classes in which you intend to compete, with a surplus of two or three, and not less than three plants of each variety, you may then with work and care succeed in reaching the top of your section.

Mr. Wyatt believed that one central stake and four stakes around it was better than the use of three stakes only, the object being to tie and keep out the growths so that light and air can reach every portion of leaf and stem. He thought some of the bottom growths at least should be removed.

Mr. Nye asked how one was to cope with a dahlia growing 12ft. high, and whether espalier-trained dahlias were to be recommended.

Mr. Mortimer thought that for a wall, fence, or for lining a path, espalier or fan-trained dahlias would be a success.

Mr. Davison (and also Mr. Mortimer) agreed that the proximity of trees had a great deal to do with dahlias growing unusually tall. He believed Wm. Marshall and some other cactus varieties needed early pinching to secure flowers in time for the shows. Mr. Stredwick said Rev. A. Hall needed rather more care and protection than most other varieties.

Mr. West said it was difficult to persuade amateurs that dahlia traders were not rogues. He urged the purchase of pot roots (year-old plants) by amateurs to secure early exhibition flowers. He disagreed with Mr. Stredwick, who said that plants from cuttings gave better and more double flowers than pot root plants.

Mr. Stredwick urged that the cactus dahlia did not deserve the condemnation it had received as a plant for garden decoration, and he referred to the great success of cactus varieties at Settle in America, and at the White City in London.

Mr. Mawley advocated the marking of certain dahlias in the society's catalogue as purely exhibition varieties, as was done with roses.

The third and last paper was "Methods of Exhibiting Dahlias," and the subject was tackled in a very hearty manner by Mr. J. B. Riding, who, after dealing with the history of dahlia competitions, poured scorn upon the continued use of boards, and the stiff arrangement of blooms for display at exhibitions. We shall give the text of Mr. Riding's paper shortly.

Mr. Mortimer thought Mr. Riding's remarks too drastic. It might be possible to work up to the use of vases entirely in years to come, but it would be foolish to do away with boxes at once.

Mr. Stredwick said the society hardly practices what it preaches, and last year did not give any honour at all to new cactus varieties which had especially long and stiff stems.

Mr. Wyatt thought the form of exhibition should be altered slowly, if alteration was desirable, but agreed that Mr. Riding had drawn attention to many obvious evils attending the exhibition of dahlias.

Mr. Gordon said he very largely agreed with Mr. Riding, and urged him to persevere in his efforts to reform the present method of exhibiting dahlias, and referred to his own efforts (now happily largely successful) in reforming chrysanthemum shows. He suggested a gradual reform, so that the altered circumstances would not press too heavily upon competitors. The display of cactus dahlias in vases, without supports, would speedily do away with the production of varieties with short and weak-necked stems. He hoped the society would soon take steps to show that the dahlia was a beautiful, as well as a show flower.

Mr. Stephens said he would even go further, and have a class or classes for dahlias in pots, as grown, to show the habit and character of the varieties, and promised help in the matter of prizes.

Mr. Nye said that at Dalston four years ago there were only about half a dozen dahlia growers, and now there were over a hundred, and to popularise the flower he challenged any amateur society to compete with them in a class for twelve dozen blooms grown by its members, twelve blooms from each of twelve members, time and place to be determined.

Mr. Mortimer urged the institution of classes for pot-grown plants.

Mr. C. E. Wilkins referred to the display of pot-grown dahlias in the past, and said the plants staged were not sufficiently attractive to induce the committee of the society to repeat the classes.

Mr. West hoped the National Society would soon become largely composed of small amateurs, and would attach to itself many kindred societies. For the small grower the boards were necessary, but there was room for both boards and vases. He believed the conference would do a great deal of good.

Mr. C. H. Welsh urged increased facilities for the affiliation of small amateur societies, to give lectures on dahlia culture, and otherwise help to extend dahlia culture among amateurs, especially among the crowds of working men who love and grow flowers and live in the suburbs.

Mr. Riding dealt with the several points raised, and expressed his delight at having created such a brisk and interesting discussion, and urged that the dahlia must be popularised if its culture was to be extended as it deserved to be. In other words, the society must advance in the matter of exhibition arrangements.

Hearty thanks to the readers of papers and to Mr. Mawley for presiding concluded the proceedings.

Royal Horticultural Society.

The exhibition held at the Royal Horticultural Hall, Westminster, on Tuesday and Wednesday, March 8 and 9, was something more than an ordinary meeting. It was a fine display, with the added attractions of a keen bulb competition, the whole making a spring show of great beauty and attractiveness, and lasting two days instead of the usual one.

Orchids, daffodils, hyacinths, and tulips, forced shrubs, alpine flowers, and carnations were the chief subjects staged, and there were a few novelties.

On the Tuesday afternoon there was a great crowd of visitors, and at times there were solid blocks of people in the gangways, all hopelessly striving awhile to pass along.

FLORAL COMMITTEE.

Roses were very lovely, as grown and shown by Messrs. G. Mount and Sons, Canterbury, who had a beautiful group of grand blooms of Joseph Lowe, Richmond, the new yellow Lady Hillingdon (A.M. on behalf of Messrs. Lowe and Shawyer, Uxbridge); Liberty, and a pink seedling. Some grand carnations were staged finely by Mr. C. Engelmann, Saffron Walden, whose stands of the dark crimson Carola were greatly admired; O. P. Bassett, Mrs. H. Burnett, Vinca, and White Perfection were others splendidly shown.

A particularly fine group of alpine and other early spring flowers was put up in good style by Mr. J. Grandfield, gardener to Sir Everard Hambro, K.C.V.O., Hayes Place, Hayes. Rhododendron praecox, Azalea amoena, etc., formed the background, and the centre of the display was of Primula denticulata alba, surrounded by P. Forbesi. A few daffodils were associated with muscaris, Primula marginata, P. floribunda, P. frondosa, P. malacoides, and P. cashmeriana. The saxifragas were delightful, as shown in pans and pots, and here S. Boydi, S. B. alba, S. Burseriana, S. apiculata, and S. marginata were particularly fine. Hardy heaths and Shortia uniflora grandiflora, were other fine things in this unusually fine exhibit.

Messrs. Paul and Son, Cheshunt, were represented by some lovely lilacs, backed by standards of the useful Pelargonium Clorinda. The lilacs were specially fine. Messrs. Jas. Carter and Co., Holborn, had a novel, interesting, and striking exhibit right opposite the entrance. It was two terraces of the greenest grass, with central steps, and a fountain behind. The background was of cupressus, and directly in front of this was a series of semicircular groups of daffodils, hyacinths, and tulips. The dividing line between the two terraces was composed of low rockwork planted with polyanthuses, anemones, primulas, squills, and crocuses. At either end were flanking groups of tulips and clipped trees.

The perpetual carnations shown by Mr. H. Burnett, Guernsey, were superb in size and colour, his Enchantress, Rose Pink Enchantress, White Perfection, Emperor, Mrs. H. Burnett, and Britannia being unusually fine. From Messrs. Bakers, Wolverhampton, came a collection of alpines, the saxifragas, Primula denticulata, and P. d. alba, Iris reticulata, Cyclamen coum, trilliums, and dwarf phloxes being the chief objects. Mr. Profittlich, Twickenham, brought up some superb lily of the valley. Messrs. Heath and Son, Cheltenham, arranged alpine and spring flowers in a rock garden, and made a pretty little exhibit. Messrs. Wm. Paul and Son, Waltham Cross, again exhibited a fine display of cut camellias.

Carnations, Lilium longiflorum, and L. speciosum, as well as Golden Spur daffodils were superbly shown in large and small vases by Mr. W. H. Page, Tangley Nureries, Hampton, the liliums were especially fine. Messrs. C. Brooks and Son, Worthing, Basingstoke, submitted blooms of their strain of primulas. Messrs. H. Cannell and Sons, brought up a few interesting cacti, and some of their beautiful zonal pelargoniums. Messrs. T. S. Ware, Lim., showed a collection of early hardy flowers, backed by heaths, rhododendrons, bamboos, etc. Saxifragas, primulas, and irises were notably good. Messrs. G. and A. Clark, Dover, had also a rock garden, and showed primula species and polyanthuses well.

Mr. F. H. Chapman showed some lovely irises of the reticulata section, including a number of seedlings; with these were seedling freesias and seedlings of Narcissus calathinus. Messrs. Stuart Low and Co., Enfield, had a famous lot of cut carnations, and flowering plants of heaths, cytisus, daphnes, cyclamens, boronias, and azaleas. Messrs. H. B. May and Sons, Edmonton, showed a great variety of ferns, including the finer varieties of Polypodium vulgare; small clematises in flower, were also a feature.

Messrs. Sutton and Sons, Reading, filled a large space with well-grown hyacinths, and they staged these in pleasing groups, two contrasting or harmonising varieties in each group. Some of the combinations were pink and pale-blue, apricot and cream, white and pink, dark blue and yellow, and apricot and rich red, and these were all very attractive, as well as suggestive for future spring designs. Palms and small ferns provided the setting of greenery. Messrs. J. Veitch and Sons, contributed a fine lot of hyacinths in pots, many of the popular kinds, such as King of the Blues, Jacques, La grandesse, and Grand Maitre, carrying splendid spikes.

Messrs. J. Veitch and Sons, Chelsea, put up a fragrant and beautiful group of forced lilacs. The plants were dwarf bushes, all splendidly flowered, and the leading varieties were Grand Duc Constantin, Virginalis, Souv. de Louis Spathe, Mdme. Casimir Perrier, Chas. X, Alphonse Lavallee, and Marie Legraye. The same firm contributed a very attractive bank of greenhouse rhododendrons, the lovely Camellia reticulata, Primula Kewensis, Streptosolen Jamesoni, Coleus thyrsoideus, Indian azaleas, and the elegant Cineraria Feltham Beauty. Mr. G. Reuthe, Keston, Kent, brought up camellias, rhododendrons, species of crocus, hepaticas, Narcissus cyclamineus, hardy heaths, anemones, etc. Messrs. R. Wallace and Co., Colchester, filled one corner of the hall with a rock garden exhibit that was very naturally arranged with delightful early flowers. The little glade of hardy cyclamen, the nook filled with Iris reticulata, and the foreground of the lovely Primula viscosa Mrs. J. H. Wilson, and the groups of Saxifraga Boydi, Dog's Tooth violets, and fritillaries were the leading features of an interesting exhibit.

Messrs. R. Gill and Sons, Penryn, Falmouth, had a glorious lot of rhododendron trusses, these representing their own varieties, seedlings, and Himalayan species; R. Wm. Shilson, R. eximium, and R. barbatum were all delightful. Messrs. Bees, Mill Street, Liverpool, showed a group of the graceful Primula malacoides. Messrs. J. Cheal and Sons, Crawley, submitted hardy flowers, and Messrs. J. Peed and Son, Norwood, showed alpines.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, had a group of lovely orchids, the odontoglossums being especially graceful and beautiful. Odontoglossum Cravenianum (A.M.), Odontioda Bohnhofiæ, O. Bradshawiæ, O. Keighleyensis, and the splendid O. Charlesworthi were conspicuous among a host of dendrobiums, Brassia brachiata, Miltonia Bleuana nobilior, etc. Mr. A. W. Jensen, Haywards Heath, brought up odontoglossums and Cattleya Schroderæ. Mr. J. Gurney Fowler, Glebelands, Woodford, contributed several fine odontoglossums. Mr. J. Collier, gardener to Sir J. Colman, Bart., Reigate, showed choice dendrobiums, Cirrhopetalum Mastersianum, and Bulbophyllum Siegobulbon. Messrs. Stanley and Co., Southgate, had cattleyas, masdevallias, and odontoglossums. Mr. R. G. Thwaites, Streatham, showed the yellow Dendrobium Chessingtonensis and Sophro-cattleya Doris. Mr. Mertens, Ghent, again brought over some delightfully coloured seedling odontoglossums.

Messrs. Stuart Low and Co., Enfield, sent the rare Cœlogyne pandurata, Cymbidium Holfordianum, Dendrobium nobile nobilius, Cymbidium Sanderæ, Cattleya Schroderæ, etc., and a number of the more popular dendrobiums. A group of finely-grown calanthes was staged by Mr. Ballantine, gardener to Baron Schroder, The Dell, Egham; the spikes were specially well developed, and the flowers large and bright.

Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, brought up Lælio-Cattleya Goldfinch magnifica (A.M.), Cattleya chocoensis alba, and C. Empress Frederick Westonbirt var. Mr. Day, gardener, to H. S. Goodson, Esq., Fairlawn, Putney, showed splendid plants of Odontoglossum illustre King of England, D. crispum Battle of Waterloo, Odontioda Charlesworthi, and O. Bradshawiæ Goodson's var. Messrs. J. Cypher and Sons, Cheltenham, had a pretty group of orchids, their dendrobiums being a leading feature, cypripediums, Sophronitis grandiflora, and the old Ada aurantiaca were also shown with Cœlogyne cristata.

A fine example of Cymbidium Lowio-eburneum, carrying twenty-one splendid spikes of bloom, was sent up by Mr. Branson, gardener to G. Hanbury, Esq., Blythewood, Burnham. Messrs. Sander and Sons, St. Albans, displayed orchids well, and the group contained some excellent odontoglossums, the old Dendrobium velutinum, Renanthera Imschootianum, cattleyas, and the pretty Lælio-cattleya Ernesti. Messrs. Heath and Son, Cheltenham, had a small group of cypripediums. Dendrobium Ainsworthatum aureum—thus it was labelled—was shown by Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking; it is a yellow-flowered hybrid; Epi-cattleya Nebo (A.M.) was also shown. Mr. E. V. Low, Haywards Heath, showed several plants of Cymbidium Sanderæ, Cattleya Schroderæ, Dendrobium pallens, and Brasso-cattleya Digbyano-Schroderæ.

DAFFODIL COMMITTEE.

Messrs. Cartwright and Goodwin, Kidderminster, staged flowers of the newer daffodils, including examples of King Alfred, Lucifer, Citron, White Lady, Southern Star, Weardale Perfection, and Coreen. A collection of tulips in pots was arranged by Messrs. R. and G. Cuthbert, Southgate, Middlesex. The flowers were of good quality, and carried on stiff erect stems. Sir J. T. Lipton, Unique, Prince of Austria, Pottebakker White, Keizer Kroon, Mons. Tresor, and Vermilion Brilliant were represented.

Messrs. Barr and Sons, Covent Garden, displayed a number of charming daffodils, and they showed Lord Roberts, Weardale Perfection, Peter Barr, Cassandra, Janet Image, Argent, etc. The same firm had Lenten lilies and other early spring flowers in abundance. Mr. A. Watts, St. Asaph, showed a cross between Narcissus obvallaris and N. cyclamineus, and he also showed a Giant Blue primrose.

Daffodils were shown by Messrs. J. R. Pearson and Sons, Lowdham, Notts, who had a small collection that contained such varieties as Blackwell, Homer, Gipsy Queen, Scarlet Eye, Topaz, Victoria, etc. Messrs. R. Sydenham, Lim., Birmingham, had bulbs grown in moss fibre, and excellent cut blooms of Homespun, White Lady, Commodore, Glitter, Circlet, Incognita, and other good varieties. Messrs. R. H. Bath, Lim., Wisbech, had one table side filled with bulbs grown in moss fibre in ornamental bowls and pans.

VEGETABLE COMMITTEE.

This body apparently had an easy task, as, so far as we could ascertain, there was only one exhibit before it.

Hardy kales, useful and ornamental, were exhibited by Messrs. Sutton and Sons, Reading, and of special interest were the examples of Asparagus, Improved Hearting, A1, and Hardy Sprouting kales, all of which were staged in excellent condition.

BULB COMPETITION.

There was an excellent competition on this occasion for prizes provided by the Royal Dutch Bulb Growers' Society, Mr. R. Sydenham, and Messrs. R. P. Ker and Sons.

In the traders' section Messrs. R. and G. Cuthbert secured the Royal Dutch Bulb Growers' Society's gold medal for twenty pans of hyacinths, ten plants in each pan, and they won with a finely-grown set that included Captain Boyton, Lord Derby, City of Haarlem, Ivanhoe, etc.; also the gold medal for their extensive exhibit of hyacinths, arranged across the end of the hall. The spikes of Jacques, Ivanhoe, King Menelik, La Grandesse, and Captain Boyton were very fine.

First prize for eighteen hyacinths was won by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who had superb spikes of Jacques, City of Haarlem, Ivanhoe, King of the Blues and Captain Boyton; second prize fell to Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, for finely-developed examples; Mr. A. Lewis, gardener to T. Von Heyder, Esq., Stone House, Allerton, Liverpool, third. Very fine were the four pans of hyacinths shown by Mr. E. Beckett, V.M.H., and with which he gained the first prize in that class; the varieties were City of Haarlem, King of the Blues, La Grandesse, and La Victoire, and there were ten plants of each—a grand set. Mr. J. Gibson was a close second, and Mr. Prime was third.

The best dozen hyacinths were from Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield House, Hatfield; here again City of Haarlem, Ivanhoe, Le Victoire, and L'Innocence were splendid; there was a keen competition in this amateurs' class, and the other awards fell in order to A. Earle, Esq., Childwall Lodge, Wavertree, Liverpool, Mr. G. Dyke, gardener to C. Watney, Esq., Garston Manor, Watford; Mr. T. Hudson, gardener to W. G. Woodhouse, Esq., The [illegible], Childwall, Liverpool.

Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, led for six pots of tulips in moss fibre, showing Rose Gris de Lin, Van der Neer, Vermilion Brilliant, Keizer Kroon, and Prince of Austria; Mrs. [illegible], Grange Road, Ealing, second. For six pots of daffodils, in moss fibre, Mr. W. Howe had an excellent first with Emperor, Frank Miles, Beauty, White Lady, Leonie, and [illegible]. Mr. Howe scored for six hyacinths in moss fibre, and Miss Michell, Oakfield, Cricklewood, was second.

Mr. Cryer, gardener to J. A. Kenrick, Esq., Berrow Court, Birmingham, was awarded first prize for a dozen pots of amaryllis; he won with splendidly-grown specimens of gorgeous varieties.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Phaio-calanthe Baron Schroder, from Baron Schroder (gardener, Mr. Ballantine), The Dell, Egham.

Award of Merit.—To Lælio-cattleya Goldfinch Westonbirt var., from Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury; to Cymbidium Low-grinum Rosslyn var., from H. T. Pitt, Esq., Rosslyn, Stamford Hill; to Epi-cattleya Nebo, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking; to Odontoglossum Cravenianum, from Messrs. Charlesworth and Co., Haywards Heath; to Fritillaria imperialis chitralensis, from Miss Watson, Finchampstead, Berks; to Saxifraga scardica obtusa, and to Shortia uniflora grandiflora, from Sir Everard Hambro (gardener, Mr. Grandfield), Hayes Place, Hayes; to tea rose Lady Hillingdon, from Messrs. Lowe and Shawyer, Uxbridge.

MEDALS.

Gold.—To Sir Everard Hambro, Hayes Place, Kent, for group of alpines.

Silver-Gilt Flora.—To Mr. L. R. Russell, Richmond, for forced flowering shrubs; to Messrs. J. Veitch and Sons, Chelsea, for hyacinths, lilacs, etc.

Silver-Gilt Banksian.—To Messrs. R. Wallace and Co., Colchester, for a rock garden display; to Messrs. W. Cutbush and Son, Highgate, for carnations and forced shrubs; to Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; to Messrs. R. and G. Cuthbert, Southgate, for group of tulips in pots; to Messrs. Sutton and Sons, Reading, for hyacinths.

Silver Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to H. S. Goodson, Esq. (gardener, Mr. Day), for orchids; to Baron Schroder (gardener, Mr. Ballantine), for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. H. Burnett, Guernsey, for carnations; to Messrs. Jas. Carter and Co., High Holborn, for a spring garden display; to Mr. C. Engelmann, Saffron Walden, for carnations; to Mr. W. H. Page, Tangley Nurseries, Hampton, for carnations and liliums; to Messrs. Paul and Son, Cheshunt, for lilacs and pelargoniums; to Mr. G. Reuthe, Keston, for early shrubs and alpines; and to Messrs. Barr and Sons, Covent Garden, for daffodils.

Silver Banksian.—To Mr. A. W. Jensen, Lindfield, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Mr. R. Sydenham, Lim., for daffodils; to Messrs. R. H. Bath, Lim., for daffodils and tulips in fibre; to Messrs. Stuart Low and Co., Enfield, for carnations, etc.; to Messrs. H. B. May and Sons, Edmonton, for ferns and clematis; and to Messrs. Barr and Sons, Covent Garden, for hardy plants.

Bronze Flora.—To Messrs. G. Mount and Sons, Canterbury, for roses; to Messrs. Wm. Paul and Sons, Waltham Cross, for camellias; to Messrs. T. S. Ware, Feltham, for hardy flowers; and to Messrs. R. Gill and Sons, Falmouth, for rhododendrons.

Bournemouth Gardeners' Association.

On March 1 a paper was read by Mr. Reeves on behalf of Miss C. Agnes Rooper, on "Some Experiments in Grafting by French and German Scientists." There was a good average attendance of members to listen to the paper written by Miss Rooper, who takes very keen interest in all matters appertaining to horticulture, and in this association in particular.

Mr. C. Pearce occupied the chair, and opened the discussion after the paper was read. Miss Rooper, in her paper, said the object of both savants was the same, namely, to try whether it would be possible to produce hybrids by grafting, and make their new qualities constant and distinctive. Up to this date they had not met with success. Both the French and the German gentlemen, said Miss Rooper, used herbaceous plants for their experiments because they could see the results quicker and more easily than by taking longer-lived plants.

The Frenchman, Monsieur Daniel, experimented first with plants on their own roots. He took a bean (Phaseolus vulgaris), sowed the seeds on a hotbed, in pots; the seventh day after the sowing, he grafted the resultant seedlings on each other; five days later he repotted them and grew them under the cloche system of cultivation, then gradually hardened them off until he placed them in their final situation. The result in comparison with plants from seeds sown at the same time and treated in the ordinary way under the same cultivation was, that the grafted plants, although they grew and flourished, were smaller in size than the others, and their leaves were fewer and paler in colour.

The next experiment was to graft a lettuce upon a salsify, which resulted in an improvement in the flavour of the lettuce, whilst on the other hand, its size was less than that of the normal lettuce. The operation was performed when the plants were but a few weeks old. Another curious graft with a good result with regard to flavour was by M. Daniel, who grafted a young shoot of the common hedge garlic upon a young cabbage; he cultivated the combined plant for two years; at the end of this time the peculiar onion-like smell of the hedge garlic had considerably diminished in strength, and had become combined with the smell from the cabbage, whilst the taste was a very pleasant one.

The results of the following grafts were, to change the shape of the plants. He grafted a Helianthus grandiflorus sulphureus on to a Helianthus tuberosus, a variety with red tubers. In comparing the tubers of the grafted plants with those of the normal ones they were found to differ considerably. The tubers were fewer in number, smaller, more regular, and they were attached to the stem above ground by some underground stalks which were thin and a few inches long. The colour of their skin was white in some of the tubers, pink in others, and in others again pink at the ends and white near the stem; while the normal ones were completely pink all over. A cauliflower was grafted on a turnip, the result being a feeble one. The cauliflower produced its head and the usual leaves surrounded it, but it was ill-shaped, and the root of the turnip was small in comparison with a normal one.

The theory of the German professor, Mr. Winkler, is, that to produce hybrids by grafting it is necessary to choose those plants which bud freely, and throw off side shoots easily, as poplars and willows do when pollarded, and for this reason, that the cultivator has greater power to regulate his grafts than in plants which are not so easily induced to throw up this kind of branch. Mr. Winkler took for his experiment a seedling of Solanum lycopersicum, which he grafted with Solanum nigrum. From this graft leaves were produced on the branches which were partly those of the tomato and partly those of S. nigrum. The fruits resembled those of the latter in form and size, but differed in being covered with white hairs, and the juice was of a lighter colour than in the normal fruit. Mr. Winkler experimented further by taking grafts from the grafts produced by this combined plant and producing varieties through them which all possessed distinctive qualities, although partaking of the nature of the original two plants, some having leaves like the tomato on one side of the stem, and like those of S. nigrum on the other; and some having leaves half like a tomato and half like those of S. nigrum.

Other instances of grafting were given, and hearty votes of thanks were accorded Miss Rooper, Mr. Reeves, and the chairman.

British Gardeners' Association.

At the last meeting of this association, Mr. George Hemming in the chair, resolutions were passed condemning the action of the London County Council in appointing a soldier as chief officer of the Parks Department. A sub-committee was appointed to consider the adviseableness of convening a congress of gardeners, and invitations will be issued to leading members of the profession to take part in it. Fifty-three new members were elected, bringing the total up to 1,706.

FORTHCOMING ENGAGEMENTS.

MONDAY, March 14.—United Horticultural Benefit and Provident Society; Annual Meeting at the Royal Horticultural Hall, at 8 p.m.

WEDNESDAY, March 16.—Royal Society of Arts Meeting.

THURSDAY, March 17.—Torquay Spring Show.
Linnean Society Meeting.

TUESDAY, March 22.—Royal Horticultural Society; Narcissus Committee at 11.30; Fruit, Floral, and Orchid Committees at 12 o'clock; Masters' Lecture at 3 p.m. on "The Adaption of the Plant to the Soil," by Mr. A. D. Hall, M.A., F.R.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, March 23.—Stour Valley Gardening Society's Exhibition of Vegetables at the Royal Horticultural Hall.
Great Jubilee Bulb Exhibition at Haarlem, to be opened by Prince Henry of the Netherlands; continues to March 31.

FRIDAY, March 25.—Good Friday.

MONDAY, March 28.—Easter Monday.

WEDNESDAY, March 30.—Royal Society of Arts Meeting.

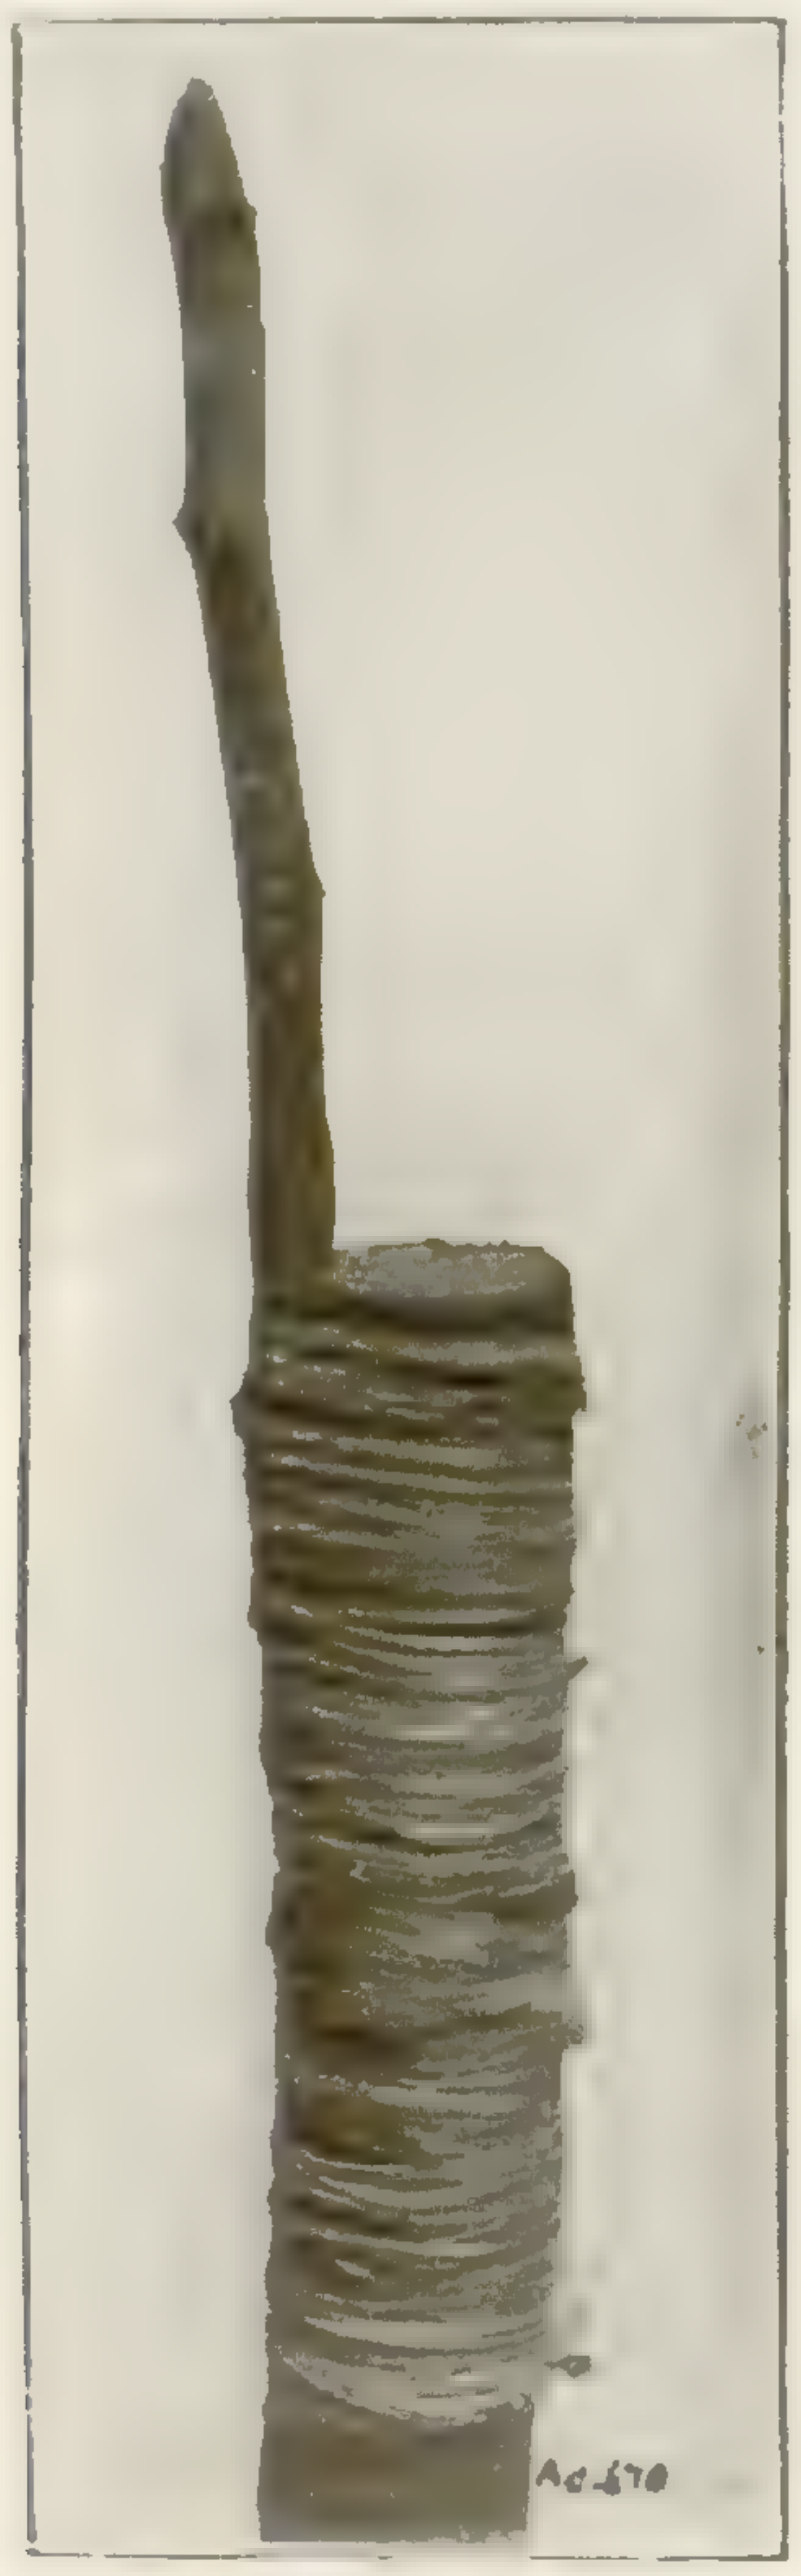
Prudential Assurance Company, Lim.—The sixty-first annual report for the year ending December 31, 1909, of this company is of the most satisfactory character, and affords further proof of the high estimation in which it is held. In the ordinary branch, the number of policies issued during the year was 76,087, assuring the sum of £7,044,603, and producing a new annual premium income of £415,015. The premiums received during the year were £4,710,107, being an increase of £93,770 over the year 1908. The claims of the year amounted to £3,018,981. The number of deaths was 8,375, and 17,629 endowment assurances matured. The number of policies in force at the end of the year was 882,804. In the industrial branch, the premiums received during the year were £7,171,770, being an increase of £246,015. The claims of the year amounted to £2,877,978, including £176,401 bonus additions. The number of claims and surrenders, including 4,545 endowment assurances matured, was 382,233. The number of free policies granted during the year to those policyholders of five years standing and upwards who desired to discontinue their payments, was 151,865, the number in force being 1,506,408. The number of free policies which became claims during the year was 41,386. The total number of policies in force at the end of the year was 18,375,229; their average duration exceeds eleven and a-half years. The assets of the company, in both branches, as shown in the balance-sheet, after deducting the amount written off securities, are £74,201,701, being an increase of £2,242,842 over those of 1908.

ANSWERS TO CORRESPONDENTS.

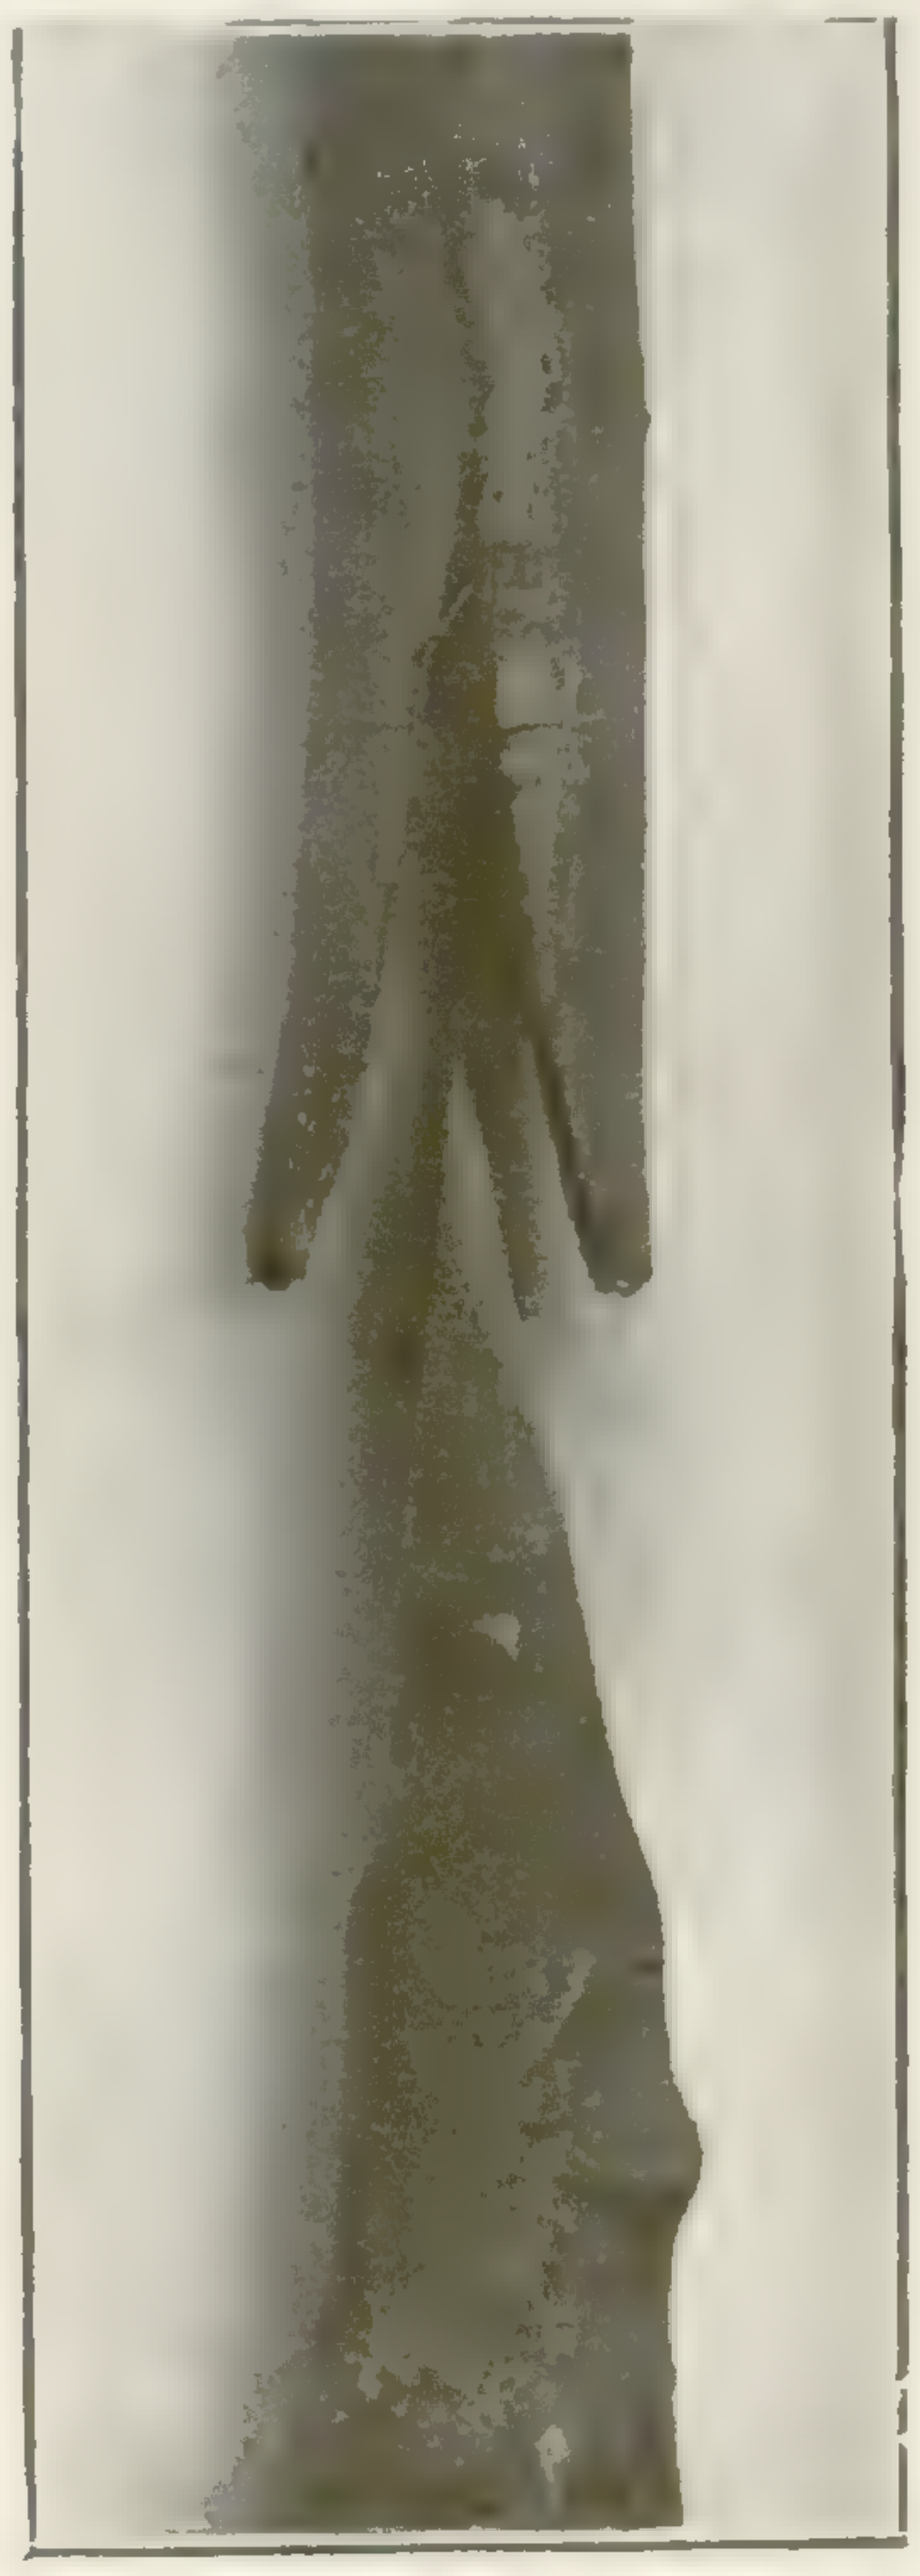
WHITE SPECKS ON VINES.—E. B., Manor Park: The specks are probably due to sap exudation, but we are examining them further, and will report if there are developments.

UNSATISFACTORY VINE LEAVES.—H. J. W., Larbert: The trouble is a purely local one, and, much as we should like to, we cannot help you at this distance. Perhaps the insecticide used was stronger when used for the lower part of the vines than for the upper part. The hot-water pipes may have been treated with something that has proved unpleasant to the vine growths near them. Questions of light and moisture may also have some bearing upon the unsatisfactory state of the few lower growths.

CROWN AND SADDLE GRAFTING.—M. P. N., Newark: Grafting is one of the oldest, and also one of the most popular, of methods of propagating fruit trees. It is also a fine means of renovating an orchard by grafting good varieties of apples on to healthy stocks of worthless varieties. Clematis, lilacs, and several ornamental shrubs are propagated by grafting, and this method of increase is largely adopted in the multiplication of new roses early in the year. The vogues most popular with cultivators are crown grafting, saddle grafting, and tongue grafting, and they are undoubtedly the best. In crown grafting, the portion of the stock in which the scion or graft is to be inserted is cut off square at the top, and a triangular cut, three inches or so in length, is cut in the side. The lower part of the scion is cut to fit the stock, and a slight nick is made at the top of the cut to allow the scion to project slightly over it. This method is suitable for large or small stocks, which may be seedling apples or crabs with a single stem on the branches of trees of considerable age. Saddle grafting is only suitable for small stocks, not greatly exceeding in size that of the scion. In carrying out this method, the top of the stock is so cut on each side to a depth of three inches as to form a wedge, and the base of the scion is cut to fit it. In tongue grafting the stock is cut to fit much the same as with crown grafting, and a slice is cut in a sloping direction, commencing about three inches from the top. About an inch from the top a slit is made to receive the tongue of the scion. The latter is shaped at the base in much the same manner as the top of the stock, and a notch is made to form a tongue, which is inserted in the slit on the stock. In fixing the scion must fit exactly on one side. Grafting out of doors is best done in March, when the sap is rising, and the scions should have been cut a month or so previous, tied into small bundles, with the names attached, and inserted in a border on the north side of a wall. The scion must be tied in securely, and the tying material and the top of the stock be covered with a thick layer of grafting wax or a prepared clay mixture.



CROWN GRAFTING OF FRUIT TREE.



SADDLE GRAFTING OF FRUIT TREE.

RED-LEADING SWEET PEA SEEDS.—G. R. D., Bedford: For outdoor sowing it is often desirable to red-lead sweet pea and also culinary pea seeds to preserve them from mice and birds. You should hurry up with the sweet peas, and you cannot do better than secure a copy of the third edition of "Sweet Peas and Their Cultivation," 1s. 2d., or 1s. 8d. (cloth), post free from THE GARDENERS' MAGAZINE office, 148 and 149, Aldersgate Street, E.C. The seeds must be moistened, and a shallow tin lid of a box or canister is a specially suitable implement for moistening the seeds in. Use clean water, and leave the seeds in the water for half an hour, then pour off all the superfluous water and dust the moist seeds with dry powdered red lead, taking great care not to inhale the powder, as it is extremely poisonous. With a circular motion roll the seeds round in the tin lid until each seed is covered with a thin coating of red lead, then place the seeds on a sunny shelf in a greenhouse to dry, and as soon as dry enough to handle without removing the lead, sow them thinly where they are to grow and produce flowers.

GRUBS IN FERNS.—H. R., Yarmouth: The grubs are those of the Vine Weevil (Otiorhynchus sulcatus), a pest that is capable of doing a great deal of harm to vines, and to the roots of ferns, asparagus, gloxinias, and many other plants. The eggs and grubs are often imported in leaf-soil, hence it is always a good plan to sterilise such material when there is any doubt as to infestation. If the plants are all fairly well established, you may stand the pots in a tank of tepid water, the latter reaching well above the rim of the pots, for twenty-four hours. The grubs will be suffocated by this means, and if the plants are laid on their sides to drain, and carefully treated in the matter of watering, no harm will come to them. If the plants need repotting, then deal with them at once, taking great care to free them from the old soil and to burn or deeply bury such soil and the grubs in it. You should deal with the matter at once, as the grubs are so far advanced that they will ere long assume the beetle or weevil form, and be able to move about freely.

BLACKENED DAHLIA CUTTINGS.—J. C., Tunbridge Wells: The two cuttings sent were so badly smashed in the post that it was quite impossible to tell what they were or what was the cause of the trouble to which you refer. It is a great mistake to put specimens for inspection or for naming between the folded sheets of an ordinary letter, and send them thus through the post without any kind of protection. If you will send us one or two cuttings, and a rooted cutting, showing the blackening, pack them in a little tin or wooden box, and direct them to the Editor, Endsleigh, Priory Park, Kew, Surrey, we will do our best to discover the cause and find a remedy for the mischief.

NAMES OF PLANTS.

H. J. W., Larbert.—Carex brunnea variegata.

S. E., Hitchin.—1, Pteris semi-pinnata; 2, Nephrodium lepidum.

A. F., Hunstanton.—1, Abies Douglasi; 2, Thuia Lobbi; 3, Coprosma Baueri variegata.

R. Y., Torquay.—1, Cornus mas; 2, Iris stylosa; 3, I. histrioides; 4, Scilla siberica.

C. R. G., Effingham.—1, Primula farinosa; 2, a good, deep-coloured P. obconica; 3, Odontoglossum crispum, a very poor variety.

K. C. F., Bridgewater.—1, Crowea angustifolia; 2, Boronia megastigma; 3, Acacia dealbata; 4, Sparmannia africana; 5, Odontoglossum triumphans; 6, Cypripedium Euryades.

MUSHROOMS AND THEIR CULTIVATION.

By T. W. Sanders, F.L.S. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 1s. net, by post 1s. 2d.; cloth 1s. 6d., by post 1s. 8d.

This addition to the literature of the mushroom, and, indeed, other edible fungi has, we learn from the preface, been written to meet the requirements of amateur gardeners, who need guidance as to the various methods of growing mushrooms for home consumption. Hence, there are chapters on mushroom spawn, the preparation of beds, indoor and outdoor culture, the production of mushrooms in cellars and greenhouses, and in these we find all the details essential to success stated concisely and with remarkable clearness. There is also much information on the culture of mushrooms by various simple and somewhat unconventional methods, and on various other points of interest associated with mushrooms. The several pests that hinder the grower in his endeavour to obtain abundant supplies receive attention, and the best methods of combating them are described. Of special interest is the chapter on the cooking of mushrooms. This, however, is not less useful than interesting as the recipes are remarkably good. There is a chapter on edible fungi, in which numerous species other than the Common Mushroom (Agaricus campestris) are described. We are glad to find that the author states in the first paragraph, "It is hardly safe for anyone lacking an intimate knowledge of mycology, and especially familiarity with the genera and species, to gather and eat them." It is certainly not safe, for some that are of good flavour and not harmful when quite young, give very unpleasant, if not dangerous results when somewhat advanced in development.

THE HORTICULTURAL DIRECTORY FOR 1910.

("Journal of Horticulture" and "Poultry" Office, 12, Mitre Court Chambers, Fleet Street, London). Price 1s

This handy book of reference is so well known and regarded with so much favour that it would be superfluous to go much beyond directing attention to the fact that the edition for the current year is published, and is fully equal in merit to the issues of previous years. As usual, the work contains a directory of the London and provincial nurserymen and seedsmen, a list of home and Colonial botanical gardens, a list of fruit and flower salesmen, and a list of horticultural builders, and a directory of the gardeners in the United Kingdom. The last-named forms the principal feature of the work, and its importance will be fully appreciated when we state that it occupies 365 pages.

CULTURE OF THE CHRYSANTHEMUM.

By W. Wells (W. Wells and Co., Merstham, Surrey). Price 1s. 6d.

We are not quite certain when the first edition of Mr. Wells' book was issued, or how many editions have been published, but we are quite clear with regard to the high degree of popularity it has enjoyed from the first, and to its value as a guide to those anxious to obtain a leading position among the more successful of the cultivators. This edition is the fiftieth thousand, and a better proof could not be desired of the estimation in which it is held by those who devote attention to chrysanthemums. Mr. Wells, in the issue of this edition, has fully appreciated the popularity the book has enjoyed, and with a view to even further enhance its usefulness has subjected the contents to a thorough revision, and has added several new chapters. Especially interesting is the author's account of his trip to the United States in November last, for he visited many of the leading shows, and not a few of the principal growers and raisers, and expresses his views freely with regard to what he saw.

KELWAY BORDERS.

A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.

Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.

KELWAY and SON, The Royal Horticulturists,
Langport.

NOW IS THE TIME TO PLANT Kelway's beautiful Blue Delphiniums, in borders and beds; as clumps on the lawn, and at the sides of carriage drives. There is no hardy flower more stately and of lovelier shades of BLUE—that precious colour in the garden.

We recommend the following named collections:—
Collection B, 15s. a dozen; 100 for £5 10s.
Collection D, 34s. a dozen; 3s. each plant.
KELWAY and SON, Langport, Somerset.

FIDLER'S NEW ILLUSTRATED CATALOGUE of CHOICE GARDEN SEEDS will be sent, post free, to any address on receipt of postcard. Write at once for a copy. It may help you to save 50 per cent. on your seed bill this season.

FIDLER and SONS, Royal Berkshire Seed Stores, READING.

BLACKMORE AND LANGDON,

Twerton Hill Nursery, Bath.

GARDEN IRON AND WIRE WORK and Ornamental Wood Work of every description, Espaliers, Rose Trainers, Archways, Pergolas, etc. Now is the time to consider your Garden Improvements. Send for Illustrated Catalogue. BOULTON and PAUL, Ltd., Dept. M5, Norwich.

MODERN METHODS OF HEATING.—Domestic hot-water supply, etc., for country mansion, greenhouses, motor car houses, etc. Send for special catalogue, free. BOULTON and PAUL, LTD., Heating Experts, H Dept., Norwich.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

Situations Wanted—*continued.*

MR. W. J. SHORT, Freeland Gardens, Woodstock, Oxon, wishes to recommend H. BEES, aged 23, as JOURNEYMAN, Inside or Inside and Out; 9 years' experience; two years' inside here.

GARDENER (Under); single Man; good references. Apply WALTER NEALE, Fulmodeston Guist, Norfolk.

GARDENER (Under, Inside and Out or Single-handed); 9½ years' experience, all-round work; good character; age 23. FUDGE, 2, Wycliffe Road, Winton, Bournemouth.

YOUNG MAN (18) seeks SITUATION in the garden as Improver, Inside, or Inside and Out; 2 years' experience; good references; disengaged when suited; Bothy preferred. V. MEPHAM, 21, High Street, Old Town, Eastbourne.

YOUNG MAN (22) seeks SITUATION; Second, where three or four are kept; well up in pleasure grounds and fruit, with a knowledge of Inside work; excellent references; six years experience. H. RAPLEY, Rose Lodge, Norwood Hill, Charlwood, Surrey.

GARDENER (Under) seeks good responsible SITUATION, Inside and Out; age 21; good all-round experience of 5½ years; good references as to character, etc.; bothy preferred. L. BIGWOOD, Kingsbury Green, N.W.

GARDENER, good all-round; well up in garden work, Inside and Out; married; 6 years' good character. F. COSSINS, Placewood Cottage, Sutton Valence, Maidstone.

SITUATION WANTED as GARDENER; Single-handed or with help; life experience Inside and Out; good refs.; age 36. H. P., 21, Office of this Paper

HEAD GARDENER wishes to recommend his Son as IMPROVER (Inside and Out); aged 19, three years' experience; Bothy preferred. W. JARRETT, The Wakes Gardens, Selborne, Hants.

IMPROVER, age 16, seeks SITUATION in good establishment; three years' good character; can be well recommended. Apply F. TULL, Wootton Bassett Road, Purton, Wilts.

WANTED, SITUATION as GARDEN LABOURER, age 40; married, no family; good character and good experience; scythe and machine and spade work, etc; willing to be useful; disengaged. W. L., Grove Yard, Daybrook, Nottingham.

YOUNG MAN, age 28, requires SITUATION as Second, Inside or Inside and Out; 14 years' experience; Bothy preferred. Apply Mr. JESS, The Gardens, Parmoor, Henley-on-Thames.

YOUNG MAN (18) seeks SITUATION in Gardens, IMPROVER (Inside, or Inside and Out); three years experience; well recommended. H. TOMPKINS, Mears Ashby, Northants.

YOUNG MAN, age 26, life experience in general work, seeks SITUATION, Inside and Out; steady, industrious; well recommended; lodgings preferred. ROBB, The Gardens, Appleby Hall, Atherstone.

YOUNG MAN (19); GARDENER (Under); five years' experience Outside; good character; strong, willing, obliging. A. W. DINNAGE, 43, West Street, Crawley, Sussex.

YOUNG MAN in Pleasure Grounds and Kitchen Garden; age 26; 5 years' reference. H. HOGG, care of Mrs. Spooner, Walnut Cottage, Clapham, near Worthing, Sussex.

YOUNG MAN, age 20, requires SITUATION in gardens; 6 years' experience; good reference; Bothy preferred. Apply H. YOUNG, Exton, Oakham, Rutland.

YOUNG MAN, age 19, requires SITUATION in gardens, Inside, or Inside and Out; 5 years' experience; good reference. Apply E. ROOTES, 14, Rawdon Road, Maidstone.

YOUNG MAN (23), Inside under Foreman, or Inside and Out; eight years' good references. GOAD, 14, Ladysmith Road, Eltham, Kent.

YOUTH (17½), with some experience, seeks SITUATION in Gentleman's Garden to improve, with good references; strong and willing. F. WELLS, Herbert Road, Hornchurch, Essex.

LAD, age 15, seeks SITUATION as APPRENTICE or IMPROVER; three years' excellent character; well educated; height 5ft. 7in.; Bothy preferred. FRANK BRISTOW, Bathealton, Wiveliscombe, Somerset

Situations Vacant.

WANTED.—Young married man as GARDEN LABOURER for general work in garden. Apply HEAD GARDENER, Woodside, Chenies, Rickmansworth, Herts.

WANTED a YOUNG MAN, age 21, understand vines, peaches, and general work of greenhouse; wages, 18s., with lodge. Apply GARDENER, East Burham Grove, nr. Slough.

WANTED, strong YOUNG MAN for Outside; some knowledge of glass; able to take duty and well recommend, 14s.; Bothy and vegetables. Apply G. W. HOWSON, Grimsthorpe Castle Gardens, Bourne.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Protection of Fruit Trees.

MR. W. A. COOK.

The rapidly-swelling flower buds of fruit trees in garden and plantation should suggest to those who have not had sufficient experience to be in a position to fully appreciate the importance of keeping well in advance of the season's work, that provisions for the protection of blossom and embryo fruits from spring frosts should be made forthwith. The experienced cultivator will not be in need of advice as to the importance of promptitude, or the steps that should be taken; but for the information of those who have not a close acquaintance with the details of fruit tree management, it is necessary we should at the present time direct attention to the more important points in the selection and use of protecting materials. In the first place, it should be clearly understood that the protection should not be given before it has become really necessary, and that the materials used should not exceed what is absolutely necessary for safeguarding the embryo crops. The reason for delaying the use of protective materials as long as is possible consistent with safety, and of limiting the quantity to the necessities of the case, may be very briefly stated. Shelter such as is afforded by netting or textile fabrics necessarily maintains a higher temperature about the trees, and therefore assists in accelerating the development of the flowers, and this is not desirable, inasmuch as the earlier the flowers are developed the longer, generally speaking, is the period in which they are exposed to the risk of injury from unfavourable climatic conditions. With regard to the use of the material, if this is applied so liberally as to deprive the trees to any considerable extent of light and air, the growth will be weakened, and more or less injury done both to the trees and their crops. There are several methods by which the crops of such fruits as peaches, nectarines, apricots, apples, pears, and plums can have efficient protection in all but exceptional seasons, but in private gardens it will be advisable to place the chief dependence upon such well-tried materials as scrim canvas, tiffany, and fish netting. Fighting the frost with the aid of smudge fires, which has proved successful in California, and in the West of England, belongs to the commercial orchard rather than to the garden devoted to the production of supplies for home use: and the old-fashioned method of using branches of spruce fir or evergreen shrubs should only be resorted to where there is a difficulty in obtaining a sufficient quantity of other material. Branches of trees and shrubs are better than nothing, but they have an untidy appearance in a well-kept garden, they deprive the trees of a considerable share of the light and air so essential to their well being, and they may assist in bringing insect pests from shrubbery and plantation to the fruit trees. In the selection of fabrics and netting it is essential to give full consideration to the time that can be devoted to the trees when under protection, as well as to the relative merits of the materials. Scrim canvas, of which there are several varieties, is perhaps the most efficient, but to use this material to the best advantage the trees should be regularly covered and uncovered, for its texture, which renders it so valuable as a means of protection from frost, excludes so much light and air that when allowed to remain in position throughout the day the growth may become seriously weakened. An ideal method of protecting wall trees is a movable glass coping twenty-four or thirty inches wide, and curtains of scrim canvas. These curtains should be about six feet wide, and of a length sufficient to reach from the lower part of the coping to within about ten inches of the ground. With the aid of hooks they can be suspended from a wire fixed under the lower part of the coping, and be held in position at the bottom with hooks and a horizontal wire some ten inches above the surface of the border. So arranged they can, with the aid of poles placed twelve feet apart, be drawn back in the morning, and made secure for the day. The coping may be made with thin boards, instead of glass, or even with canvas. Two thicknesses of fish netting may be used instead of canvas, and as there is no occasion to uncover the trees during the day, it will have a great advantage in the large number of gardens where the staff is hardly equal to requirements. There is a still simpler method that may be adopted with much success, as proved by the results that have been obtained by more than one generation of gardeners. This consists in suspending a double thickness of fish netting from hooks driven into the wall immediately under the coping thereof. The netting must, of course, be of sufficient width to reach to the lower part of the wall, and it should be kept from the trees by means of slender poles long enough to reach to the top of the wall when fixed six inches or so into the border, and be placed in a slanting direction. If poles are not available pieces of wood with a fork at the end ten or twelve inches long will be efficient in keeping the netting from the trees. So far our remarks refer chiefly to wall trees, which should, as a matter of course, receive the first attention; but we are much impressed with the importance of giving trees of choice pears, plums, cherries, and apples growing in the open quarters protection from spring frosts whenever practicable. For these trees fish or other netting, or very coarse canvas, will be preferable, as the material must remain in position until protection is no longer needed. We have used both netting and coarse canvas with so much success in the protection of bush, espalier, and pyramidal fruit trees, and our experience is by no means singular, that we strongly recommend this aspect of fruit tree protection receiving fuller consideration than, in so many instances, has yet been the case. There are difficulties in the way of our recommendation being generally acted upon, but, wherever practicable, there should be no hesitation in giving protection, as it may mean the difference between an abundance of choice fruit instead of a supply so scanty as to afford but a poor return for the time devoted to the trees in the course of the year.

Mr. W. A. Cook, head gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, is well-known by reputation and by his writings to our readers; and they will, we are sure, be pleased to see the portrait of so able a gardener in the present issue. Mr. Cook has had a varied experience. He commenced his gardening career at Shenfield Manor, and from thence proceeded to Rayners, the seat of Sir F. Rose, Bart., near High Wycombe. He next went to Woburn House, also in Buckinghamshire, and then to Norman Court, in Hampshire. After a short stay here, he proceeded to London, and his experiences in and around the metropolis included a stay at Henderson's Pineapple Nursery, under Mr. James O'Brien; a season in the propagating department at Battersea Park; a period with a high-class florist in Oxford Street; a few months in the grape-growing department at Mr. T. Rockford's establishment at Turnford Hall, and a short stay at the Crystal Palace. We find Mr. Cook next taking charge of the gardens at Holme Wood, Peterborough, where Lady Wells had a fine collection of alpine and herbaceous plants, as well as of botanical curiosities; but Mr. Cook's health was not good at this time, and a change was necessary, so after two years' stay he moved on to Compton Bassett, in Wiltshire, the seat of the late Major Heneage, V.C., who was a keen horticulturist, had a large estate and garden, and was intensely interested in fruit culture and hardy-flowering shrubs. Here Mr. Cook stayed nearly thirteen years, and then passed on to the charge of Earlstoke Park, Wiltshire, where he was busily engaged in remodelling the gardens, when the death of the owner put an end to his engagement. He then took charge of the gardens at Shirley Park, Croydon, the famous old seat of the Earls of Eldon, and afterwards went to Leonardslee, where Sir Edmund Loder's extensive collections (freely illustrated in our issue of February 8, 1908) give ample scope for his skill and wide experience. Mr. Cook is a very keen fruit grower, and has a special love for alpines and for conifers, and these latter are specially well represented at Leonardslee. Mr. Cook is also very fond of cricket and music, these are his "hobbies," and in connection with the summer game he has taken numerous prizes that give evidence of his skill both as a bowler and a batsman.

"**Botanical Magazine.**" — The issue of this publication for the current month contains illustrations of Rehmannia Henryi, a distinct species discovered by Mr. A. Henry about 1885 in the neighbourhood of Ichang, and introduced to cultivation three years since by Mr. E. H. Wilson; the corolla tube is yellow, speckled with red, and the lobes white; Aquilegia alpina, a handsome species with rich blue violet flowers; Rhododendron mucronulatum, a pleasing deciduous species, with small pink flowers; Pittosporum Colensoii, a handsome shrub bearing bright red flowers, but too tender to be grown in the open except in the Scilly Isles, and it may be some parts of Cornwall; and Notylia trisepala, a Mexican orchid, bearing slender racemes of greenish-white flowers, and more interesting than beautiful.

Garden Superintendent of the Innes Horticultural Institution.—Mr. E. J. Allard, foreman of the outdoor departments of the Botanic Garden, Cambridge, has been appointed garden superintendent of the new Innes Horticultural Institution, and has already entered upon his duties. Mr. Allard has had extensive experience suited to the work. He commenced his career in gardening at Gore Court, and afterwards for some months he was with Messrs. Sander and Sons, of St. Albans. From them, in 1895, he came to the Botanic Garden, Cambridge, as an improver-gardener, and after three years in the plant houses went to Kew. From Kew he returned to the Cambridge Botanic Garden, as foreman of the plant houses a position he occupied for over five years. He was then foreman of the outdoor departments for another five years, and he has done excellent service in both capacities. He has thus had a wide Cambridge experience, by which he is especially fitted for experimental as well as for other work, and for which there will no doubt be full scope in the development of an institution that must have important influence on British horticulture. Through our columns Mr. Allard is well known to horticulturists for his plant photography and his writings. His name is commemorated in two good hybrids he has raised—Nepenthes Allardi and Passiflora Allardi. Into his new sphere he will carry the best wishes of all his friends.

The Queen at the Japanese Exhibition. — On Tuesday last her Majesty Queen Alexandra paid a surprise visit to Shepherd's Bush for the purpose of inspecting the progress already made by the Japanese people with their part of the great exhibition that is to be opened two months hence. The Japanese gardens attracted her Majesty's attention, and she showed a keen interest in the design and arrangement of these landscapes in miniature, and conversed with Mr. Izawa, the Japanese head gardener, who, however, was so overcome by the idea that the gracious lady was Queen and Empress that his usually fluent English speech failed him, and Count Mutsu had to come to his aid. The Japanese workmen were all delighted with and very excited over her Majesty's visit, and joined with the Britishers in cheers for her. The Japanese Gardens are beginning to assume a very attractive appearance, and it is hoped that those portions of the grounds which are reserved for British horticulturists will be equally worthy of the inspection of visitors. A large portion of the available land has already been let, but there is still room for some more nurserymen and seedsmen, who can obtain plots for the purpose of displaying their methods of cultivating farm and garden plants, shrubs, lawns, etc.

Indian State Forests.—To the meeting of the Indian section of the Society of Arts, Mr. S. H. Eardley Wilmot, C.I.E., contributed an important paper on Indian State Forestry. In the course of his paper he stated that the area of the forests under the control of the Indian Forest Department was 240,000 square miles, representing about a fifth part of British India. The Department would have liked the wooded area so distributed that its produce would have been easily accessible to all its inhabitants, but they arrived too late. Mankind had been warring against the forest with fire and axe thousands of years before their time, and the Department had saved what was left. The total income from the forests of British India in 1906-7 was £1,776,000, and a net profit of £839,000 accrued to the State. The influence of the forest began immediately below the snow-line, at about 16,000ft. elevation. First came the upland meadows, next the shrubby growth of juniper and alpine rose, and afterwards the birch and firs; below these appeared the forests of oak and rhododendron, cedar, and pine, and further down the forests of long-leaved pine, which yielded good timber and much resin; and the submontane forests at still lower elevations contained the most valuable timber, such as teak, ironwood, sandal, rosewood, red sanders, and ebony. Then across the Bay of Bengal there were the primeval forests, where ocean currents had brought the seeds of exotic trees to flourish on the island shores. With the exception of teak, sandal, and a few ornamental woods, practically the whole of the timber output was consumed in India.

Cœlogyne cristata.—The cultivation of Cœlogyne cristata and its varieties is now so well understood that it is by no means unusual to meet with large, finely-flowered specimens in visiting gardens. Notwithstanding this fact, it is always a pleasure to have an opportunity of enjoying the beauty of specimens bearing the impress of cultural skill of a high order, and also to hear of them. We have to acknowledge the receipt from Mr. H. Alexander, of the Green Mount Gardens, Wigan, of photographs of groups of Cœlogyne cristata in which the specimens are of large size and finely flowered. In each group there are four specimens, and these have an average diameter of four feet.

B.G.A. Concert.—The London branch of the British Gardeners' Association is holding a Bohemian concert at Carr's Restaurant, Strand, on Saturday, March 19, at 7.30 p.m. Mr. E. F. Hawes will preside. Single tickets are 1s. each, and double tickets (lady and gentleman) 1s. 6d. each, these being obtainable from members of the branch, or from Mr. Cockram, the hon. secretary, 8, Burns Road, Battersea. The proceeds of the concert will be given to a London hospital.

"**The British Fern Gazette.**" The third number of this quarterly publication has made its appearance, and is not less interesting than were its predecessors. The Editor (Mr. C. T. Druery, V.M.H.) deals with the naming of varieties; but he does not—as we anticipated he would do—touch the question of ridding the host of the barbarous names which so many beautiful forms have had inflicted upon them. On the contrary, he states that he does not intend "to enter into the vexed question of nomenclature generally, which, in point of fact, is no such bugbear to those within the cult as it appears to outsiders." That may be; but there can be no doubt that the long and unpronounceable names which numerous varieties of British ferns possess keep many plant lovers outside the cult who should be busily engaged in adding to their gardens a selection of varieties that would greatly enhance their attractions.

NEW PLANTS, ETC.

LÆLIO-CATTLEYA GOLDFINCH WESTONBIRT VAR.

This very beautiful variety differs from the original hybrid between L.-c. warnhamensis and C. aurea in having a deeper colouring. There is an orange suffusion in the golden sepals and a fine orange-red shading in the petals, while the lip is bright red-purple. A.M., R.H.S., March 8. Lieut.-Colonel G. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

PHAIO-CALANTHE SCHRODERÆ.

A very interesting and novel orchid, obtained by crossing Phaius Wallichi with Calanthe C. B. Schröder. The habit of growth is intermediate between the parent, and the flowers are fairly large. The sepals and petals reflex, and are soft greenish-yellow with a purplish base, while the large lip is dark crimson-purple. F.C.C., R.H.S., March 8, Baron Schröder (gardener, Mr. Ballantine), The Dell, Egham.

EPI-CATTLEYA NEBO.

A curious little hybrid between Epidendrum O'Brienianum and Cattleya Clæsiana. The growth is very like that of an epidendrum, and the manner of flowering is also similar. The small flowers are carried in a terminal cluster; the sepals and petals are rosy pink, and the lip white. A.M., R.H.S., March 8. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

CYMBIDIUM LOW-GRINUM ROSSLYN VAR.

In this varietal form the lip is white, finely coloured with bright crimson, and with yellow side lobes. The sepals and petals are red-brown. A.M., R.H.S., March 8. Mr. H. T. Pitt, Stamford Hill.

ROSE LADY HILLINGDON.

A beautiful new tea-scented rose that appears to be very suitable for forcing. It has long stems and handsome leafage, and the full, broad-petalled blooms are of a pleasing shade of yellow. A very fine new rose. A.M., R.H.S., March 8. Messrs. Lowe and Shawyer, Uxbridge.

SAXIFRAGA SCARDICA OBTUSA.

An encrusted, dense-growing saxifraga that carries pretty white blooms. It is an excellent and useful kind, and adds variety to this now extensive group of alpines. A.M., R.H.S., March 8. Sir Everard Hambro (gardener, Mr. J. Grandfield), Hayes Place, Kent.

SHORTIA UNIFLORA GRANDIFLORA.

A charming little alpine that appears to be a stronger grower than the type. It has flowers much larger than those usually seen, and these are of pretty pink shade. A.M., R.H.S., March 8. Sir Everard Hambro.

FRITILLARIA IMPERIALIS CHITRALENSIS.

This is quite distinct from the ordinary yellow forms of the garden Crown Imperials; but Kew has decided it is a geographical form of F. imperialis, and so named it Chitralensis, as it was collected near Chitral, where in the flowering season it covers the ground, and is a fine sight. It is quite hardy, of more slender growth, and scarcely so tall as a Crown Imperial, and its flowers are yellow. The new-comer promises to be a very useful hardy spring flower. A.M., R.H.S., March 8. Miss Watson, Finchampton.

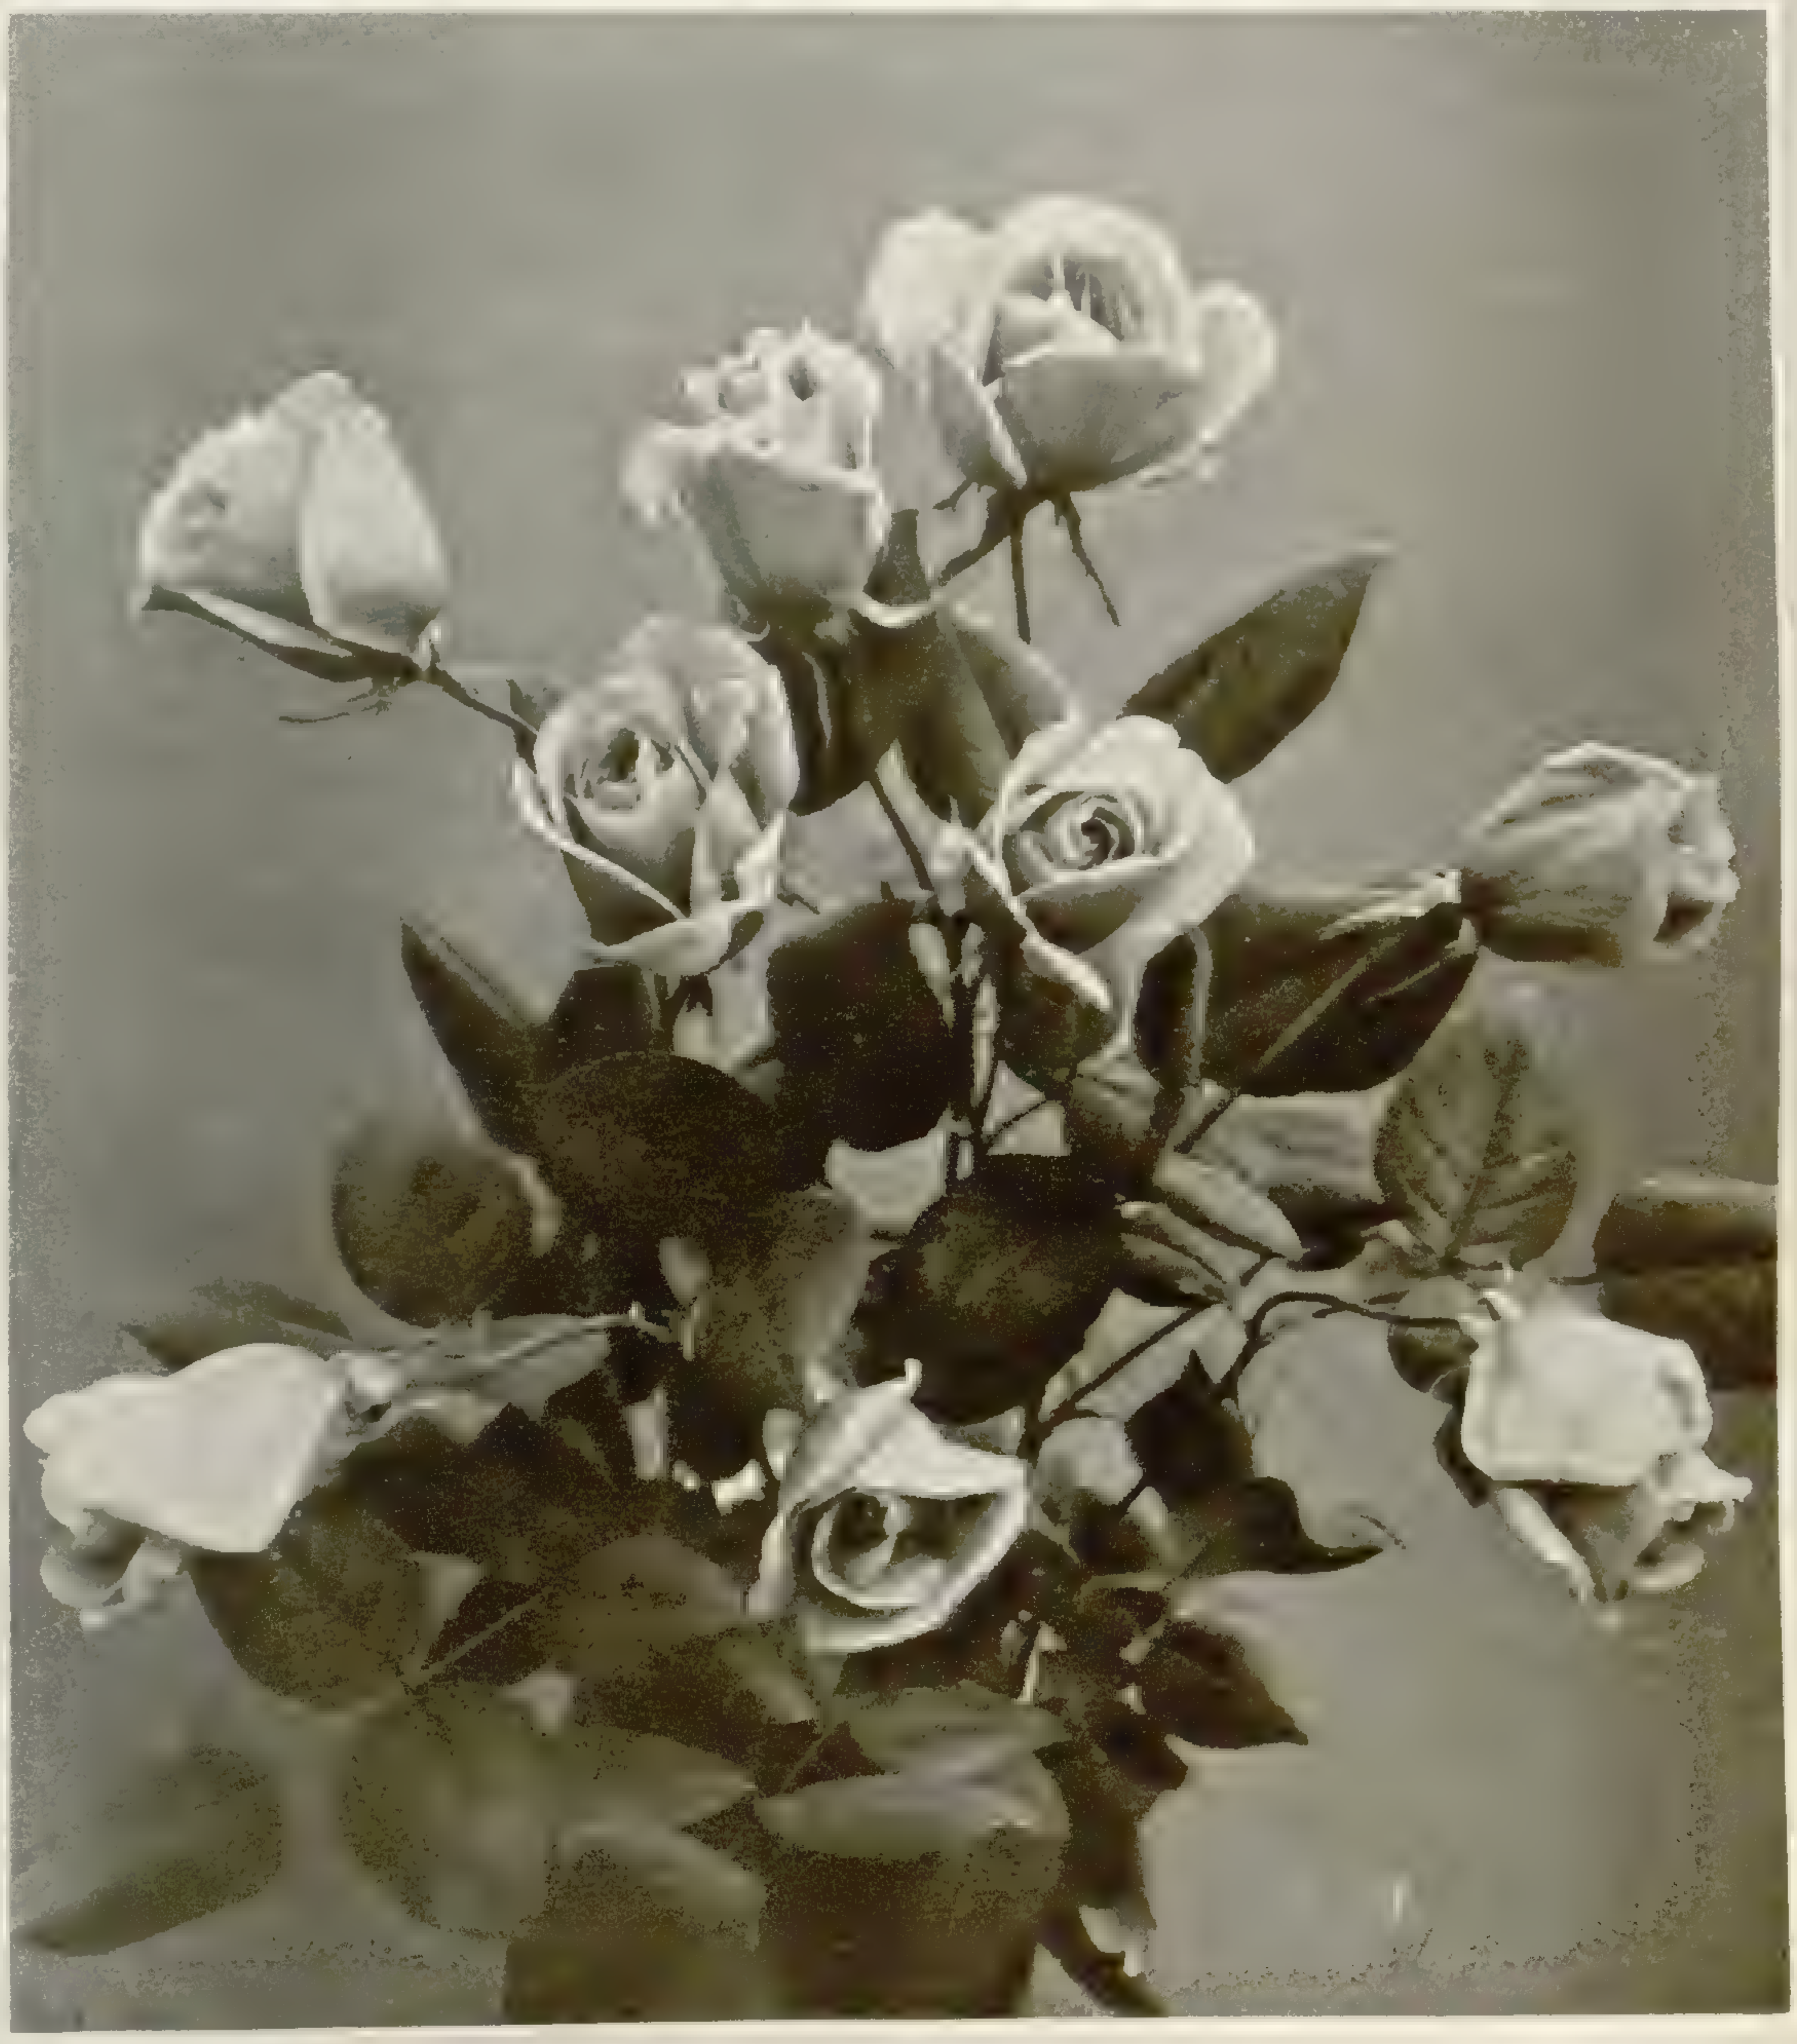
KITCHENGIA UNIFLORA.

A pretty little prostrate plant from Madagascar. It has fleshy green leaves along its slender shoots, and its flowers are solitary and terminal, tubular and of a bright rose-red colour. The plant is not unlike a creeping or drooping sedum. "Bot. Mag.," t. 8.286.

THE BEST LOAM FOR PERPETUAL CARNATIONS.

Carnations can be, and are, grown in a variety of soils of extremes in texture, yet it is wise to avoid very light or very heavy soils. A great deal depends upon the grower who controls the food and water supply. It is also important that he should endeavour to thoroughly understand the peculiarities of his particular soil.

It is generally conceded by all the best carnation growers of both this country and America that the ideal soil for carnations is a silky, semi-sandy loam, one which feels smooth when rubbed between the fingers and thumb; sufficiently light in texture to afford free and ready drainage of any surplus moisture, yet with sufficient body to retain the available plant food. It should come from a well-drained locality, and possess an abundance of vegetable fibre. As a rule such loam is light-brown in colour, and invariably is very evenly balanced in the essentials of plant life, viz., potash, phosphoric acid, and nitrogen, and hence will not require to be greatly enriched. We may be as much mistaken over our loam as we are over our bread. It is not essential that all good loam should be light brown, nor is it true that only good bread is white.



NEW TEA-SCENTED ROSE LADY HILLINGDON.

A.M., R.H.S., March 8. Messrs. Lowe and Shawyer, Uxbridge. Flowers soft yellow.

There are many excellent qualities in clayey soil, but this should be exposed to aeration and freezing for some time previous to its being used, so as to make its constituents available to the plant. It will also require much sand and manure to make it mechanically right for carnations. The danger is of it going down too solid, and so be too retentive of moisture.

Avoid black sandy peat soil, also cold gritty soil which is devoid of all humus. These are the two classes of soil in which it is most difficult, if not impossible, to grow carnations, yet it is safe to say that almost any turf from a meadow that has fed cattle can be made suitable for them.

The old practice of stacking loam for one to two years previous to use, with the idea that such treatment mellowed and generally improved the soil, has been proved erroneous. Loam is different to wine, and there should be a limit to its age. We now know that the average loam is in a prime condition for use for carnations after being cut from six to nine months, and also that the stacks should not be excessive in size, there being a danger of the loam becoming sour in the centre. To turn the loam after being stacked three months is labour well spent. The one idea in preparing turf is to have the vegetable fibre sufficiently decayed to be a food to the plant, and yet keep the soil open. Hence, if the fibre is too much decomposed these advantages are lost.

Montagu C. Allwood.

Pyannies (Pæony), Lilies, and Roses are the aristocrats among hardy plants, to which the rural cottagers of England have clung with the greatest tenacity. Call to remembrance these picturesque homes, and instantly we have these noble hardy plants grouping themselves as accessories of local colouring, and imparting an old-world beauty that is every day becoming more rare.—Thomas Smith, Walmsgate Gardens, Louth.

ANNUALS FOR THE CONSERVATORY.

Time was when annuals of any description would have been considered unworthy of use as decorative plants for the conservatory, or even for room decoration. Opinions, however, have changed, as we see by the numbers of annuals grown in pots for the London and provincial markets, to say nothing of the numbers now grown in private establishments for home use.

With but few exceptions cool treatment is all that is necessary for most of these subjects. In all stages of their growth extremes of heat and cold are decidedly harmful, and should be carefully guarded against. The cultivator should aim at having the plants as robust as possible, or, in the majority of cases, the flowering period will be unsatisfactory.

Neither must the plants be overcrowded in the pots, or in the structure in which they are growing. A cool frame, or pit, fully exposed to the sun, is the most suitable structure in which the majority of these may be grown. Plenty of air night and day—must be given when the weather is at all favourable.

It is the custom with many growers to sow the seeds direct into the same sized pots in which the plants are intended to flower; others first raise the seedlings in small pots, and transfer into larger as required. In either instance, it is absolutely necessary that the seedlings should be thinned out at the earliest possible moment, and the utmost care taken that the soil does not become sour by over-watering, or failure will surely follow. Immediately the pots become filled with roots feeding must commence, and nothing is better, or safer, than diluted liquid cow manure to which a little soot has been added; this, given as a watering twice or three times a week, or as may be deemed necessary, will not only considerably lengthen the flowering period, but the individual flowers, or spikes, will be much finer.

The majority of these annuals thrive well if grown in a mixture of soil composed of about three parts loam and leaf-soil, and one of coarse silver sand or road grit; if the latter is used it must be clean and sharp. The usual processes of staking and tying must be carried out as with other pot plants, if the best results are to be expected. The following list of annuals, hardy and otherwise, includes only those that are easily grown, last well, and are the most useful.

Alonsoa Scarlet Gem and A. Warscewiczi compacta are both half-hardy annuals, flowering freely at all stages of their growth; a sunny position should be given to them, or they will become drawn, and exceed their natural height of ten or twelve inches. These are very bright and telling, and lend themselves admirably to pot culture.

Amaranthus salicifolius and A. tricolor are valuable foliage plants, highly decorative, and adapted to greenhouse or frame treatment during the summer months; they delight in an abundance of moisture and sun. Both are classed as half-hardy annuals.

Asters are now largely grown as pot plants, the Victoria, Empress, and Diadem types being especially suitable. These afford a wealth of colour for a long period, and an economical way of growing them in bulk is that of bringing the plants on in beds of prepared soil, on a sheltered border, and, just as the buds are forming, carefully lift and transfer into suitable pots; if well watered, and carefully shaded for a few days, the plants soon recover themselves.

Among candytufts any of the giant varieties are useful as pot plants, and one plant in a 48-sized pot is sufficient; feed freely, and grow in the full sun.

Chrysanthemums (annual varieties) make very showy and effective pot plants as they grow rapidly, and are almost hardy, delighting in plenty of moisture and cool treatment. A wide range of colours is now obtainable among these, all are profuse flowering, and continue so for a very long period. The double coronarium varieties are extensively grown for market purposes. One plant is ample for a 48-sized pot, if well grown. An occasional syringing overhead with clear soot water will promote the health of the plants, and assist in keeping away insect pests. For early spring flowering the seed should be sown during the autumn, and for summer and autumn flowering during March or April.

Collinsia bicolor, although not often seen as such, makes a pretty pot plant, and deserves to be grown far more extensively than it is at present; cool treatment is all that is necessary, with not too liberal feeding.

Dimorphotheca aurantiaca is one of our newest annuals; the flowers are orange coloured, and produced freely. Cool treatment is best; plants raised in heat are inclined to become drawn and straggling in growth. They will flower in from six to eight weeks from the time of sowing the seed, and remain in flower for a quite considerable time.

Godetias, with perfectly cool and careful treatment, make very beautiful and effective decorative plants. At no stage of their growth must they receive warm treatment; an abundance of air, night and day, is essential to their well doing, and thus treated they continue in flower for quite a long time, and are very attractive. One plant for a 48-sized pot is ample, and as the plants increase in size and the pots become filled with roots liberal feeding should be resorted to, in order to maintain vigour and prolong the flowering period.

No list of annuals would be complete without the old-fashioned favourite, mignonette; when well grown few flowers find greater favour as pot plants than these, of which there are now so many excellent varieties, ranging in colour from white to crimson. At all stages of their growth the plants should receive an abundance of moisture, but the pot drainage must be perfect. The soil used should be light, rich, and porous, the addition of crushed brick rubble, or old mortar, forming an excellent medium for the plants to grow in. Should artificial feeding become necessary, the manure used should be of a cool nature, and great care be used in its application.

Myosotis (forget-me-nots) are always acceptable in the greenhouse or conservatory. Seeds sown in the open ground during the early summer months will furnish excellent plants for lifting and growing in pots for flowering indoors during Christmas and the New Year. Ruth Fischer is an excellent variety for this purpose, the plants are compact in habit, and the flowers of a charming blue colour, with glossy green foliage. Perfection and Royal Blue are also desirable varieties.

Nicotiana affinis and its several varieties are valuable annuals for the conservatory, as they continue to bloom for a considerable time after those growing out of doors have been destroyed by frost. Most of these are very sweetly scented, and will flower freely, even under most indifferent treatment; seeds should be sown in heat during March or April, gradually hardening off the seedlings as the season advances.

Nemesia strumosa and its varieties are all welcome subjects among this class of plants. For early spring flowering the seeds should be sown during the autumn, and the plants receive cool treatment at all times, or no more artificial heat than is absolutely necessary to exclude frost from the structure in which the plants are growing. The utmost care must be used when giving water, especially in the earlier stages of growth.

Rhodanthe maculata and R. Manglesi are half-hardy annuals of a distinctly showy character. The seeds should be sown in the pots in which the plants are intended to flower; if for late summer use no heat is required for raising the seedlings. A fair sprinkling of seed should be allowed for each pot when sowing, as it is necessary to have quite a number of plants in each pot, growing fairly close together, otherwise the pots will be but scantily furnished. When their beauty as pot plants is on the wane the flowers may be cut and used as everlastings for winter use.

VIOLAS IN SANDY SOIL.

Many persons are, I know, very reluctant to plant violas in a sandy medium. These plants do better in a good holding loam, I admit, but they also succeed well in a sandy soil if well looked after during the summer months. In a seaside town on the west coat of Lancashire I had much experience in the cultivation of violas, and roses, too, in sandy soil; in fact, the ground seemed to be almost pure sand in many places. I saw violas succeed well in a certain garden there, and did not fear to try them myself afterwards.

The light ground was deeply trenched, a very easy matter, and a good quantity of well-rotted manure was mixed with the soil but near the surface. Care was taken to put out the plants with a nice ball of rich soil adhering to their roots, and the planting was done as early as possible in the spring, so that the violas were nicely established in their summer quarters before the ordinary bedding-out work was finished. Twice during the summer some rich soil and rotted manure, mixed, and passed through a rather fine-meshed sieve, was put on as a surface mulch an inch deep, and this did the plants much good.

Being not far distant from the sea the gardens were almost floating on water when the tides were high, and it was a very easy matter to find water by digging down to a depth of three or four feet at such times. But the garden in which the violas grew so well was situated on rising ground, and the sea water did not moisten the soil near the surface. In the case of my roses, though, it did. Very often sea water was found about thirty inches or three feet below the surface, filtered in from the sea, which was never much below the soil level in that part. The roses were grand specimens, and bore huge flowers in profusion.

G. B

GREENHOUSE MANAGEMENT.—THE A[illegible] GREENHOUSE, the popular book by the [illegible] "Amateur Gardening," not only treats o[illegible] tion and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, by post 5s. 6d. from THE GARDENERS' M[illegible] Office, 148, Aldersgate Street, London.

QUALITY & HARDINESS

THE "AFFORESTATION" BANNER UNFURLED.

250 Acres of
Unsurpassed Nursery Stock
Grown on the Cold
Exposed Derbyshire Hills.
SUITABLE FOR ANY CLIMATE.
Apply for Catalogue to Dept. A,
JAMES SMITH & SONS,
Darley Dale Nurseries,
Nr. MATLOCK

Specialities.

Rhododendrons, 40 acres.
500,000 Hardy Heaths.
Huge Quantities of fine healthy Larch and other Forest Trees.
Ornamental Shrubs, Climbing Plants.
Roses, Fruit Trees, etc.

ALTITUDE OF NURSERIES.

Range up to 1100 ft. above sea level. being the most exposed in the British Isles.

SPECIAL DISCOUNTS TO LARGE BUYERS.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.
YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

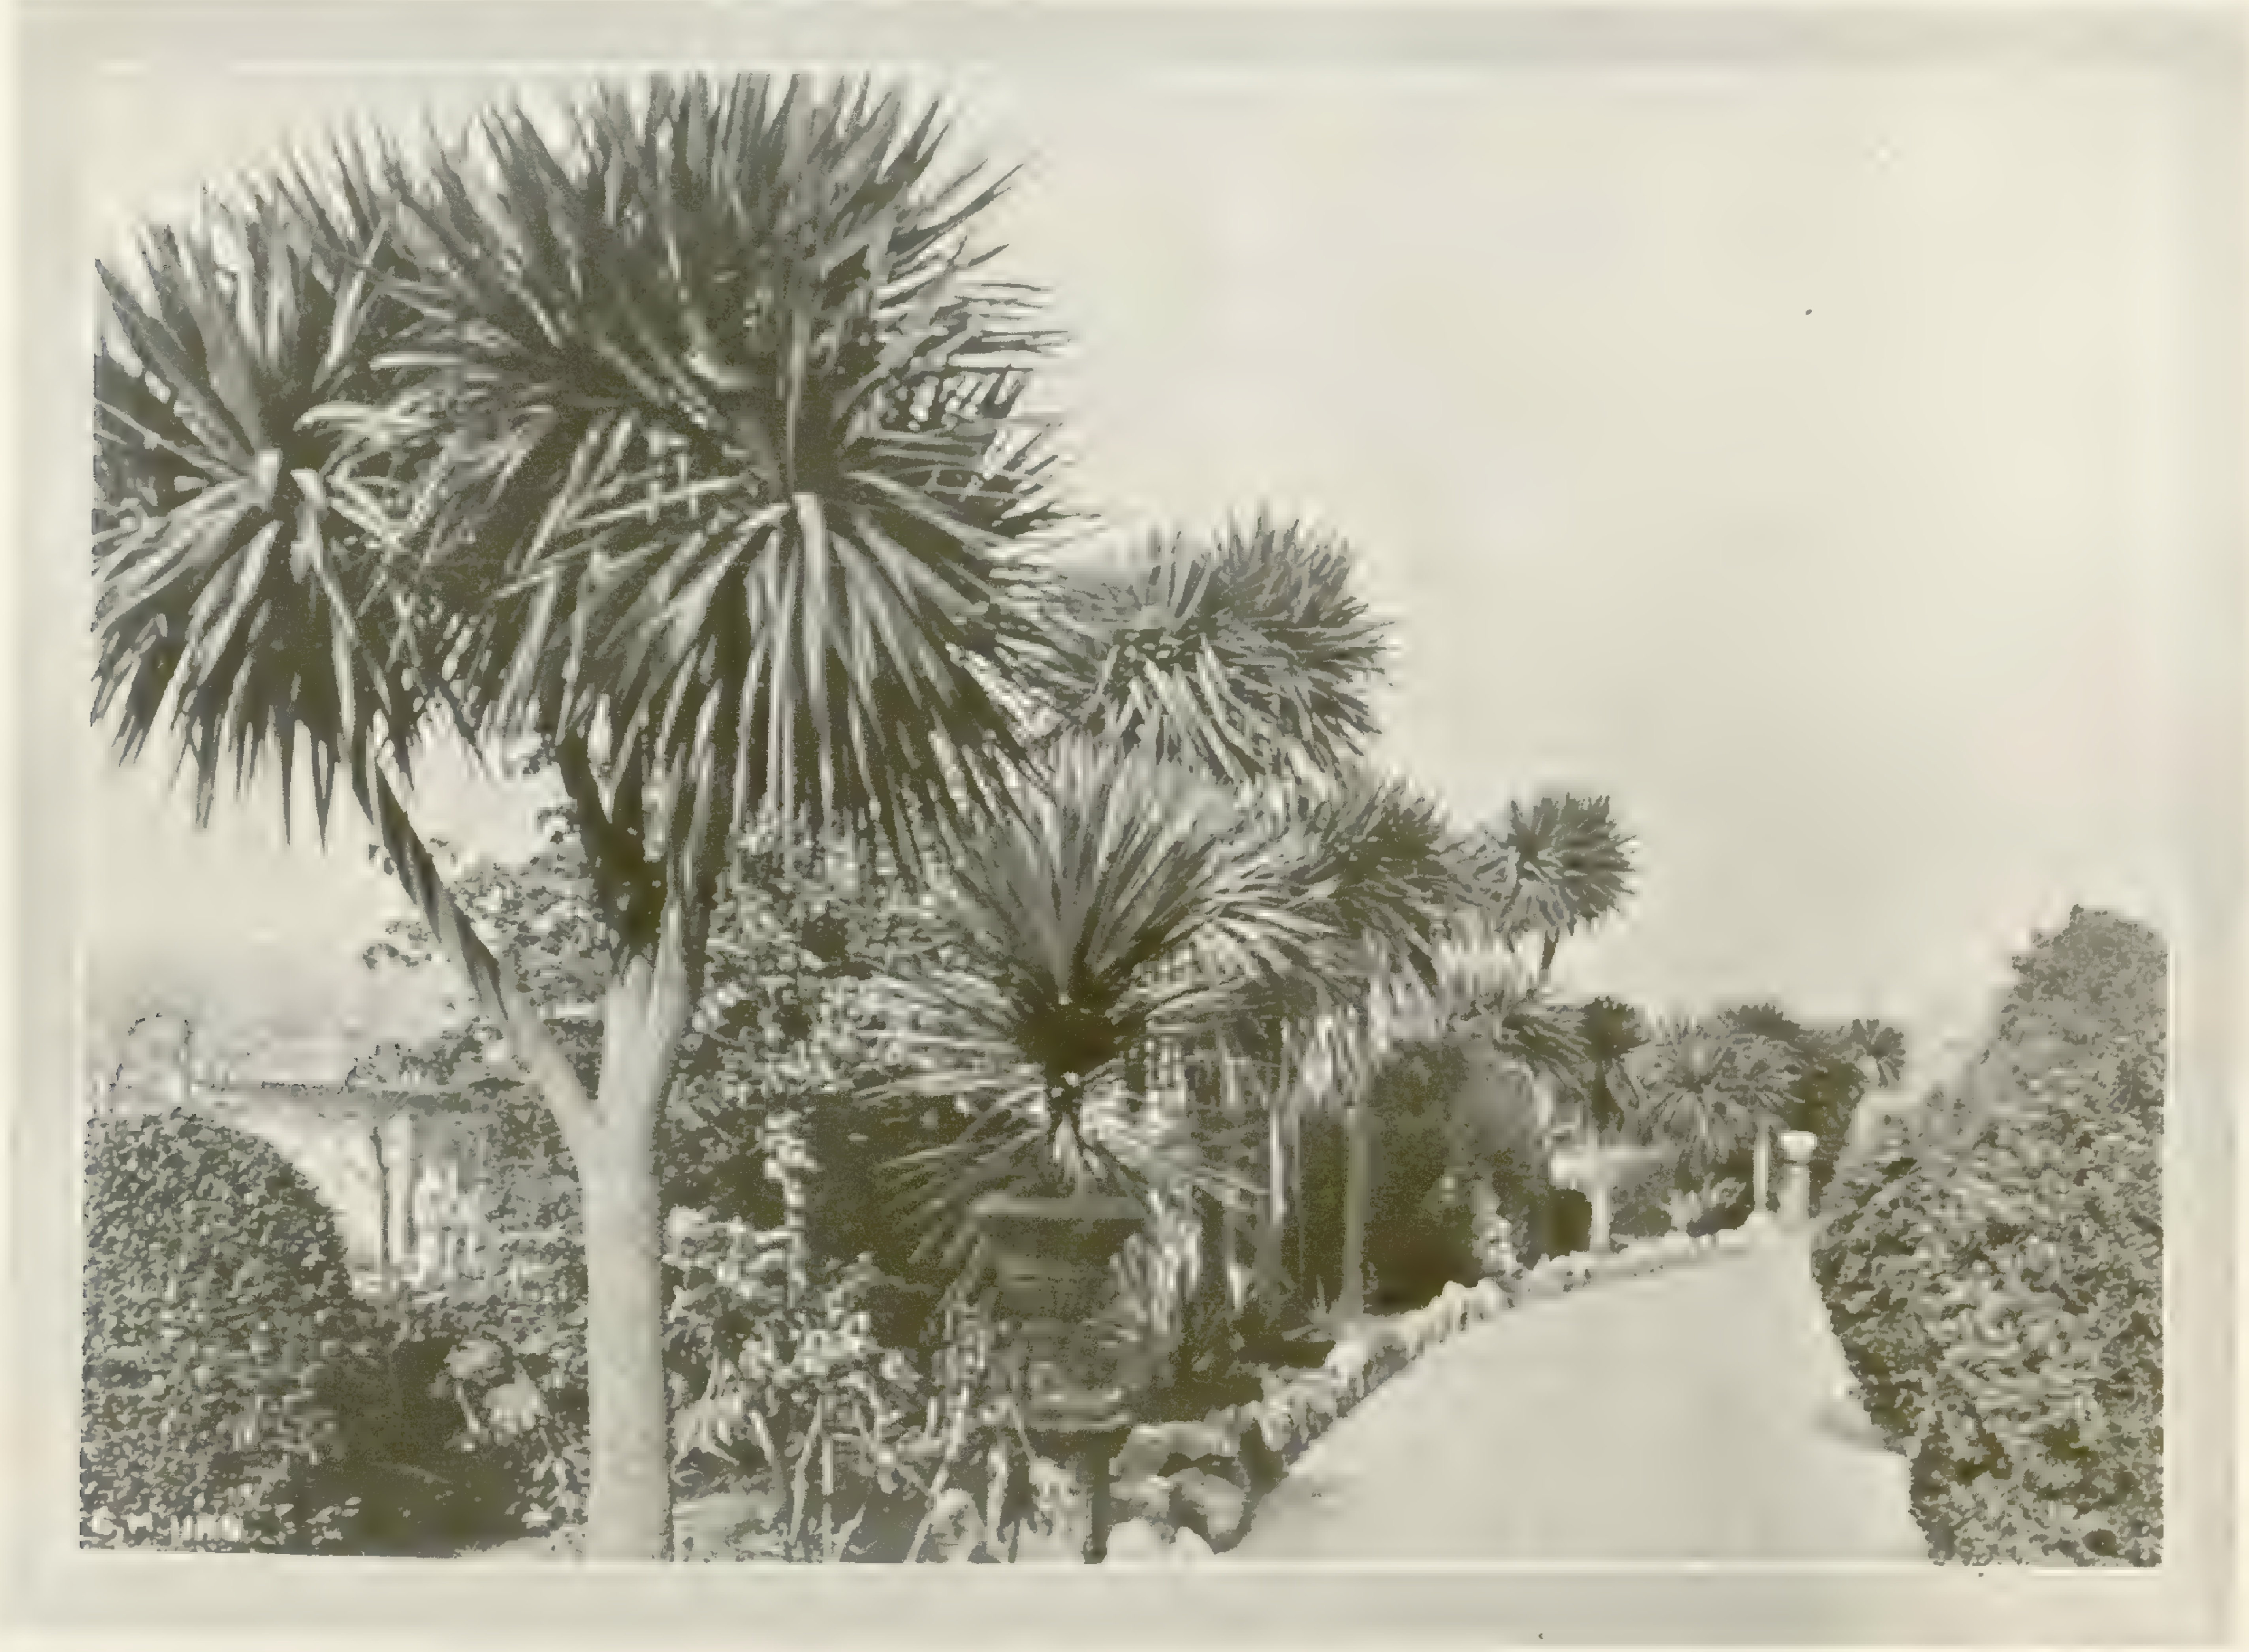
GARDENS ROUND TORQUAY—I.

In giving an account of some of the more noteworthy of the many interesting and attractive gardens in and around Torquay there is no occasion to set forth, or even refer to, the advantages possessed by the town as a health resort. These are widely known, and it would appear from the continuous extension of the boundaries that they are fully appreciated and taken advantage of. Moreover, information with regard to them is readily accessible, and without difficulty intending visitors can place themselves in possession of the facts relating to the climatic conditions and other matters of importance to those in search of health or relaxation from the strain of everyday life. In studying the climatic conditions they will learn that the mean annual temperature of Torquay is in excess of that of England as a whole, that the mean maximum temperature is lower, and the mean minimum temperature is higher, and that the daily range is less at Torquay than in other parts. They will thus learn that the summers are cooler and the winters are warmer than elsewhere, and that the climate is remarkable for its equability. They will learn also that the annual rainfall is only about two inches in excess of that of the whole of England, that the air is relatively dry, and that the average sunshine is very high, more particularly in winter. These points are mentioned, not so much from the hygienic as from the horticultural point of view, as they will enable the reader to more fully understand how it is that a considerable number of subtropical plants, which hardly exist in the open in other parts of the United Kingdom, make the most luxuriant growth, and give a quite distinct character to garden scenery. Torquay has been described as Sunshineland, and it fully justified its appellation during the week in which the gardens to which reference will be made were visited. Last year was not remarkable for its record of sunshine, but from Monday midday till the Saturday afternoon the sun shone uninterruptedly and with great brilliance, rendering it difficult to obtain good photographs, and completely spoiling not a few promising subjects.



TORQUAY—DRACÆNA WALK IN THE ROYAL TERRACE GARDENS.

Torquay, long famous for the historical events that have taken place within its beautiful bay, appears to have first obtained attention as a place of residence for members of the community, other than the hardy fisherfolk and seafaring people, in the early part of the last century, and it was not long in obtaining popularity. The earlier houses were built in the northern corner of the bay, at the junction of two valleys, one of which comes down from the north-east and the other from the north-west. With the growth of the town main roads were made through these valleys, and flanked with houses, and from these other roads radiated in all directions, and on the slopes and summits of the lofty hills and high cliffs stately mansions and moderate-sized villas were built, and their environment converted into beautiful gardens. In the conversion of the hillsides and cliffs into building land it would appear that their arborescent features were, as far as possible, preserved, and the effect produced by the white houses perched high up among the trees is remarkably beautiful.

Public Gardens.

According to the official reports, Torquay has thirty-five gardens, with an aggregate area of 300 acres, and these, under the care and supervision of Mr. H. A. Garrett, the Borough Surveyor, are throughout remarkable for the admirable manner in which they are kept. Large as is the area in proportion to the population, it does not appear in excess of requirements.

The most important of the public open spaces are the Princess Gardens, which occupy a position between the Torbay Road and the margin of the bay, not far distant from the point at which the principal roads through the town converge. There are several enclosures, all skilfully designed, tastefully embellished, and highly kept, and some are devoted to flowers, and others to garden games. A more delightful place in which to spend an hour or so daily during a short stay at Torquay would not be desired, for the visitor can enjoy the flowers or the games according to his bent, or he can take the wiser course, and enjoy both. In addition to the beautiful display of flowers, and the interest of bowls and lawn tennis, there is the magnificent bay, so exquisitely beautiful that it would be difficult to exaggerate its distinctive charms.

TORQUAY—PRINCESS GARDENS.

One of the Princess Gardens, in which Flora reigns supreme, is herewith depicted, and in the illustration we have evidence of the vigour with which plants from warmer climes than our own thrive under the conditions that obtain in this favoured town. The handsome Dracæna australis, which requires the shelter of glass in other parts of England, has grown to a size that indicates considerable age, and the finely branched heads suggest the stately aspect of specimens in their native habitats. Each year this and other gardens are made gay with tulips, wallflowers, arabis, and other subjects that yield of their floral beauty in the season of spring, and these are, in their turn, replaced by the more beautiful of the tender and other plants that belong to the summer. Nearly opposite to the Princess Gardens is the commencement of the famous Royal Terrace Gardens, which proceed a considerable distance westward at the foot of the cliff. Here we have still further proof of the equable temperature which prevails throughout the year, and the long lines of stately dracænas, the luxuriant Australian tree ferns, and the bold groups of the New Zealand flax, with other denizens of temperate regions, produce effects so widely differing from those produced in gardens in other districts as to at once arrest the attention and evoke the admiration of those who visit the gardens for the first time.

The King's Gardens, still farther westward, have been formed within the past few years, and if of less importance from the gardener's point of view, are not without interest. These have been formed on a comparatively narrow strip of ground alongside the road that runs on the western boundary of the grounds of Torre Abbey, and afford but little scope for the landscapist's art. Good use, however, has been made of the ground by the authorities, who have formed a long shallow pond, crossed here and there by rustic bridges, and thus afforded the children an opportunity for indulging their taste for sailing toy boats.

Eastward is an open space of some importance, and this is known as the Torwood Garden, and is probably one of the earliest of the gardens formed in the town. It contains many fine old trees, that are well able to give welcome shade during the summer months, and there are sufficient flower beds to admit of the production of attractive displays of flowers. Still further eastward is the Manor Garden, which has been formed on the slopes between the famous Lincombe Drive, and the sea. In the laying out of this area an endeavour has been made, and with much success, to maintain, as far as possible, the original features of the ground, and a more delightful natural garden one could not well desire. Cary park and Babbacome Downs also extend over a large area, and are remarkable for their beauty and for the large number of fine flowering shrubs they contain.

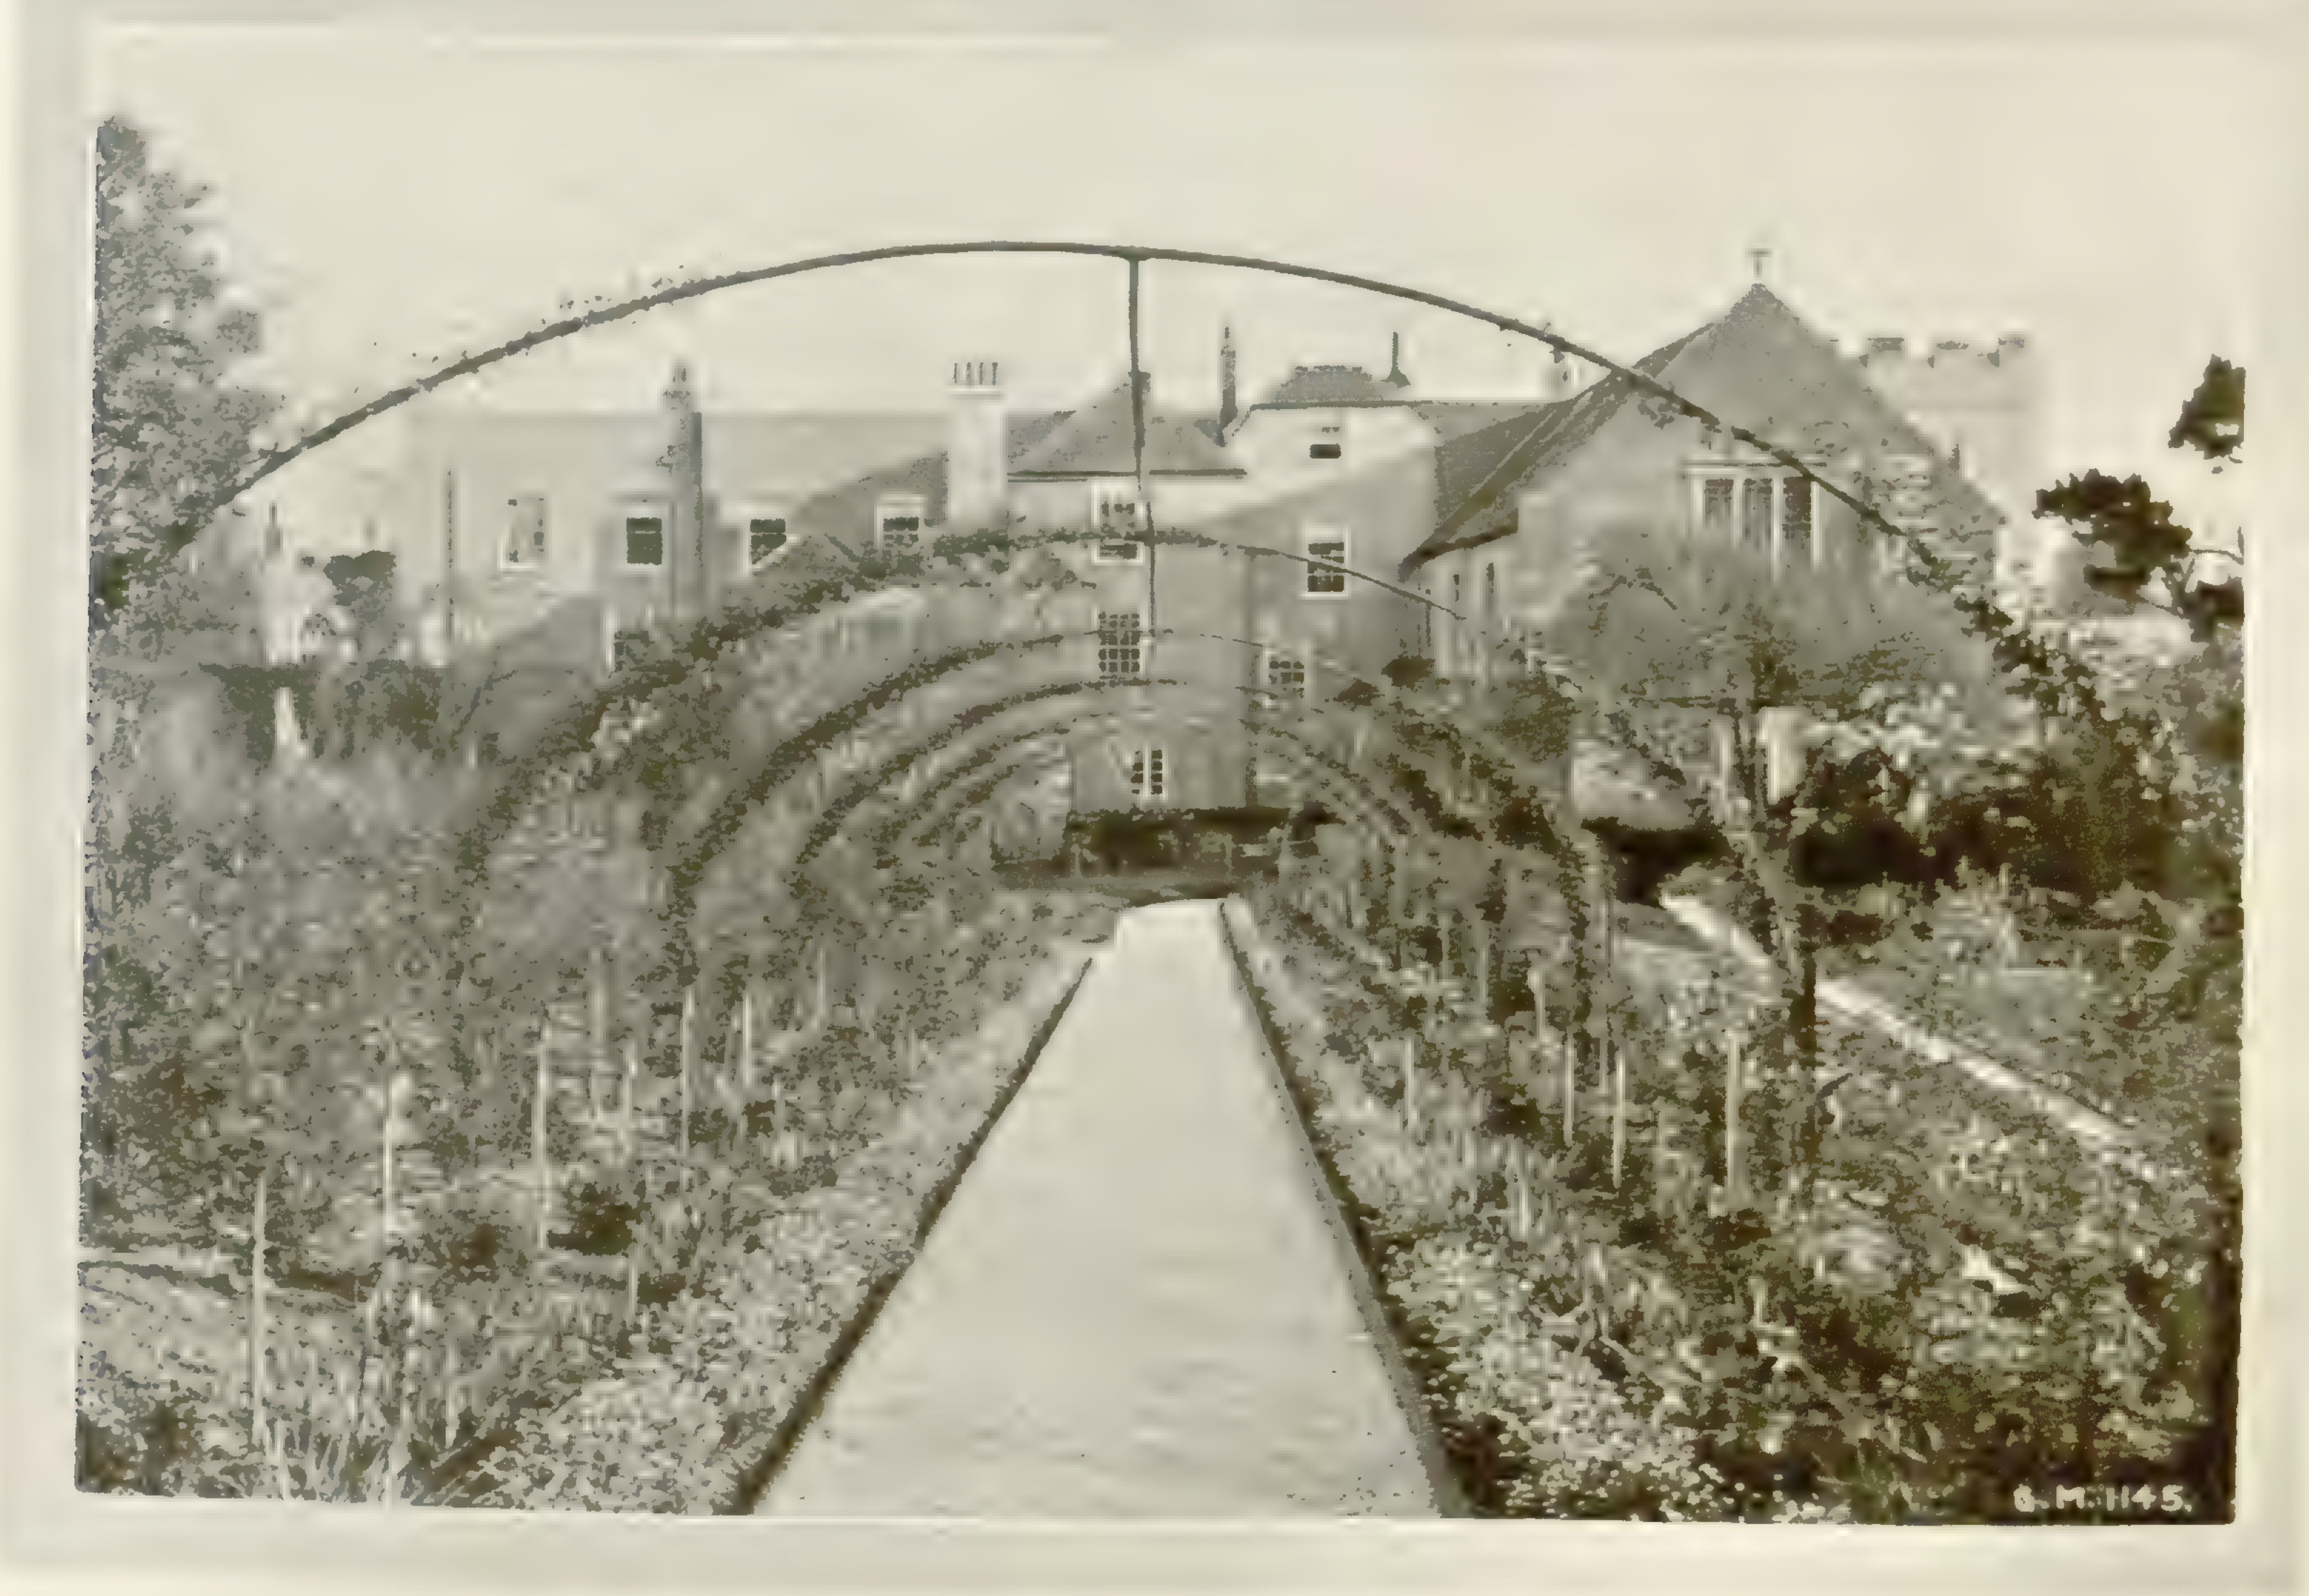
Torre Abbey.

Torre Abbey, which occupies a charming position on the margin of the bay, some three-quarters of a mile to the west of the centre of the town, is remarkable for the extent and high-keeping of its gardens and of much interest for its historical associations. Its history extends over some six centuries before Torquay obtained a prominent position as a health resort, and, as shown by its records, did much for several centuries, as in the case of some other of the great religious houses, to stimulate an interest in gardening and farming. Here, as in other parts of the country, we have evidence of the remarkable judgment shown by the founders of monastic houses in the selection of a site that is not only beautiful, but well suited to the production of the various crops and the rearing of the cattle necessary for the sustenance of the members of the house.

The abbey was founded in 1196 by Lord William Brewere for Premonstratensian monks, and was so liberally endowed by the founder as to be the most wealthy of the thirty-two houses belonging to the order in this country. At the Dissolution in the reign of Henry VIII., the abbey shared the fate of other religious houses, and during the period between the Dissolution and the year 1662 it had many owners. For a time it was the property of the Ridgways, who built the stately white mansion which forms so conspicuous an object, with its background of rich green foliage and foreground of undulating meadows, from the Torbay Road. A portion of the original buildings still remain, the most noteworthy of these being the handsome 14th century gate house and the grange, a spacious building, in which, on the capture of the "Capitana," the flagship of the admiral in command of the Spanish Armada, the crew of the vessel, some 400, were lodged. From this fact, it has long been popularly known as the Spanish barn. In the year 1662 the Abbey and the land belonging thereto passed by purchase into the possession of the Cary family, in whose hands it has remained until the present time. The present owner of the seat is Colonel Cary, who with Mrs. Cary, takes the keenest interest in their gardens.

Between the terrace garden on the south front and the sea there is a wide stretch of undulating park-like land, with a fringe of fine old trees on either side, and a few splendidly developed specimens occupying isolated positions in the open space. One of the most noteworthy of these is a variegated sycamore of huge size, and perfect in development. On the eastern side of the mansion are two exceptionally fine mulberry trees that were planted 88 years since on the occasion of the marriage of Colonel Cary's mother and father. One of [illegible] was blown down about forty years ago, and received a considerable check therefrom. but it is, notwithstanding, a fine tree at the present time. Proceeding from the mulberry trees in a northerly direction, some interesting ruins of the old Abbey are passed, and the rockery is entered. This extends the whole length of the garden, of which a part is illustrated, and affords ample opportunities for rest and retirement. The trees are of great height, and many have their trunks clothed with ivy. and the space between them has been so freely planted with bulbs and other plants as to afford a profusion of flowers, particularly during the spring months.

Both Colonel and Mrs. Cary have a strong love for roses in their various attributes of beauty, and among the more recent additions that have been made to the gardens are the spacious rose borders that flank the principal walk through the kitchen garden, and the rose arches by which it is so admirably spanned. In the borders are dwarfs and standards representing the finest of the varieties specially adapted for cultivation in these forms, and for furnishing the arches the finest of the rambling roses have been utilised. As Mr. Clarke is a skilful cultivator of roses, as of most other things, these grow freely and bloom profusely, the rambling varieties being especially attractive during the season of flowering. Other fragrant flowers that receive special attention are sweet peas and carnations, and both are grown largely and to a high degree of perfection. The sweet peas are grown in ground contiguous to the rose garden, where, with the assistance they receive from Mr. Clarke, they make a robust growth, produce flowers of high quality, and bloom quite late in the season. As evidence of the success with which sweet peas are grown, it should be stated that the flowers usually occupy a foremost position in the competitions at the local exhibitions.



TORRE ABBEY—ARCHES OF ROSES IN THE KITCHEN GARDEN.

Under glass both the perpetual carnations and the Malmaison varieties are grown with much success, and the large structure devoted to them was remarkably attractive at the time we were at Torre Abbey, and there was abundant evidence that no difficulty is experienced in maintaining a plentiful supply of blooms throughout the year. Other structures devoted to ornamental plants were not less interesting in their way, and fully deserve lengthened notice, as, indeed, do the peach houses and vineries in which crops of great excellence are annually produced.

Intensive culture receives the attention of Mr. Clarke, and he has achieved considerable success, both in glass-houses and under cloches in accordance with the French practice. Under both methods of procedure the advantage of the protection of glass in the production of winter and spring salads, even in so kind a climate as that of Torquay, was brought into strong relief. We were specially interested in the crops of cabbage and cos lettuce in a cool peach house that had been raised from seed sown in October. The plants were growing in the border, and there was a plentiful supply of large tender hearts that in quality have certainly not been surpassed by the finest of the French products. Early lettuces of high quality are everywhere in request, and this method of producing them is of much interest from the fact that the crop in no way interferes with the peach trees.

Lupton House.

Some five or six miles west of the town of Torquay is Lupton House, the seat of Lord Churston, a seat that is not less remarkable for its fine trees and other objects of interest than for the surpassing beauty of its surroundings. The mansion is the most readily reached by way of Churston Ferrers station on the Kingswear railway, and as the line winds for the greater part of the distance round Torbay, a continuous succession of views of land and water is obtained that are, for the most part, exquisitely beautiful.

The village of Churton Ferrers is described as about half a mile from the station, but it must be a mile to the handsome lodge by which access to the domain is obtained, and, after passing through the gates, a considerable distance has to be covered before the mansion and gardens are reached. The carriage drive runs for the greater part of its length along the high ground on the west side of the park, and here one might linger long enjoying the glorious picture formed by the wide-spreading woods, and large expanses of grass that vie with the emerald in brilliancy. The owners of the estate must for several generations have been great lovers of trees, for the high banks to the west of the drive are clothed with kinds, all more or less handsome, and including not a few that are uncommon in park scenery. On the left-hand side coniferous and deciduous trees have been freely planted, and at sufficient distances apart to allow them to attain their full development. To enumerate the trees that attract attention would involve the preparation of a lengthy list, and it will suffice for the present purpose to say they consist of the finest kinds, and that their condition shows they have been well cared for. Very interesting also are the groups and single specimens of the Evergreen Oak (Quercus ilex), which are in so robust a state of health as to leave no doubt as to the conditions that obtain being in every way favourable to their full development.

Occupying a site in somewhat of a hollow, the stately mansion of white stone does not command a prospect extending beyond the park, but the area of this is so vast, and the scenery so exquisite that no feeling could well arise as to a want of breadth. With a foreground of handsome shrubs and a spacious terrace garden, and a background of woods that extend a long distance up the valley, the house forms a charming picture when viewed from the higher ground. I had intended giving an illustration of the mansion in its setting of greenery, but the huge Turkey oak appealed so strongly to me that it has been substituted. The terrace garden, of which a portion is illustrated, is bounded on the south and west with rhododendrons and other flowering shrubs. On the west is a fine hedge of Berberis Darwini that closely approaches twelve feet in height, and is of proportionate thickness. This valuable evergreen not only grows vigorously at Lupton, but blooms profusely, and the great hedge presents much the appearance of a mass of burnished gold for a considerable period during the summer months. The rhododendrons are not less noteworthy in their way, for on the margin of the terrace and on the slopes that rise from the eastern end are specimens of Rhododendron arboreum that produce, concurrently with the display of golden blossom of Darwin's berberis, a colour effect of the most charming character. There is also a comprehensive collection of the hybrid rhododendrons that are perfectly hardy in all parts of the United Kingdom, and these thrive not less satisfactorily than do their Indian neighbours. Both the newer forms and the old favourites are represented in the collection, and conspicuous among the former are the specimens of Pink Pearl, of which it would be desirable to write in appreciative terms were it not so popular as to render praise wholly unnecessary.

On the eastern slopes associated with the groups of the arboreum rhododendrons are considerable numbers of specimens of the Irish yew that are so perfect in development as to contribute materially to the attraction of this part of the grounds. There are several specimens of this yew near the lodge that are hardly less remarkable for size and shapeliness. Contiguous to the mansion are specimens of Pinus insignis and Wellingtonia gigantea that not only are of great height, but perfect from apex to base.

The common primroses constitute a delightful feature of the park in spring time, some of the breadths occupying an area of several acres, and all richly bespangling the lush green carpet with their flowers. Later on the bluebells are equally attractive, for the woods abound with them, and annually they yield freely of their elegant flowers.

Pilmuir.

Occupying a commanding position on the high ground to the north-west of the town is Pilmuir, the residence of A. Backhouse, Esq., who is well known throughout the district for his strong affection for alpine plants and for the keen interest he takes in gardening generally. Standing several hundred feet above the valley below, the mansion commands a wide prospect, and the views over land and water are richly diversified and of great beauty, and especially attractive are the peeps that are obtained through the trees at various points with which the hill on its western side is clothed. The gardens are extensive, varied, and highly kept, and it matters not what aspect of horticulture the visitor may be specially interested in, he will not fail to find much that will be instructive and give him pleasure. Those who give attention to alpines will find a rock garden in which they might spend several hours without exhausting its interest; if they have a special liking for moisture-loving plants, the skilfully planned water garden will afford them abundant entertainment, and there are other features of a widely different character that are not less noteworthy.

It is not necessary to proceed far after passing the handsome lodge gates to find evidence of the successful utilisation of rock plants, and it is certainly not possible to continue long on a tour of inspection without being impressed by the high keeping which is manifest on all sides. The railway arch that spans the carriage drive not far from the lodge is admirably masked by ivies and other plants of scandent habit, the drive is flanked by specimen trees and shrubs, flowering plants abound, and consequently in the approach to the mansion the visitor has a foretaste of the pleasure in store. While hardy plants greatly predominate, those commonly known as half-hardy are taken advantage of as far as may be necessary, and they are employed in contributing to the summer charms of the flower garden on the south side of the mansion. Here there are two displays annually, and when we saw the garden in the spring May flowering tulips and wall-flowers predominated, and produced a singularly beautiful effect. On the other side is a conservatory elegant in design, and this fine structure had for its chief occupants Indian azaleas of various sizes, and, as every plant was bearing its full quota of flowers the effect was startling in its richness and beauty.

Proceeding from the conservatory in a northerly direction, and for a considerable distance, is a walk alongside of which is much that is of interest. To the right is a wall with a border at the foot, and over its surface are trailing many choice plants that are seldom seen out of doors in other parts of the country. In the border are large numbers of herbaceous plants, bulbous and otherwise, and these also include many kinds of great rarity. On the left-hand are bold groups of rhododendrons that consist of the finer varieties, and beyond these is a broad belt of trees that clothe the side of the hill. These are of considerable age, and the whole of the intervening space is filled with bulbous and other plants that in their season carpet the ground with their flowers.

Entrance to the rock garden is obtained a short distance down the drive, and the site has been so well masked that it comes as a surprise to the visitor to find himself in a large area wholly devoted to the denizens of the Alps. The garden, which is of comparatively recent date, was designed and constructed by Messrs. Backhouse and Son, of York, and may well be regarded as an excellent example of their work. To describe the garden in detail is unnecessary, but as indicating its general character it may be mentioned that boldness has been combined with ample provision for the growth of the plants in the formation of the mounds and slopes, and that the walks by which the area is intersected are so arranged that ready access can be obtained to any of the occupants. In the centre is a rocky pool, with a summer-house of distinct character, and at the north-west end is a deep gorge spanned by a rustic bridge. To enumerate any considerable proportion of the large number of beautiful plants that have been used in furnishing the garden would require much space, and it must suffice to say that on the various mounds and slopes are arabis and alyssum, androsace and aubrietia, dianthus and draba, gentian and geranium, helianthemum and hypericum, iberis and iris, linum and lithospermum, phlox and pentstemon, potentilla and primula, saponaria and silene, and saxifrage and sedum growing with great vigour and contributing their share to the interest and attractions which a well-planned rock garden is so well able to afford. The water garden is a little farther down, and this contains an excellent selection of water lilies and a number of attractive subjects that flourish on the margin of lakes and ponds.

Away on the high ground are the kitchen and fruit gardens, with numerous glass structures devoted to fruit and plant culture, and here, as elsewhere there is ample evidence of Mr. T. Prowse's skill and administrative ability.

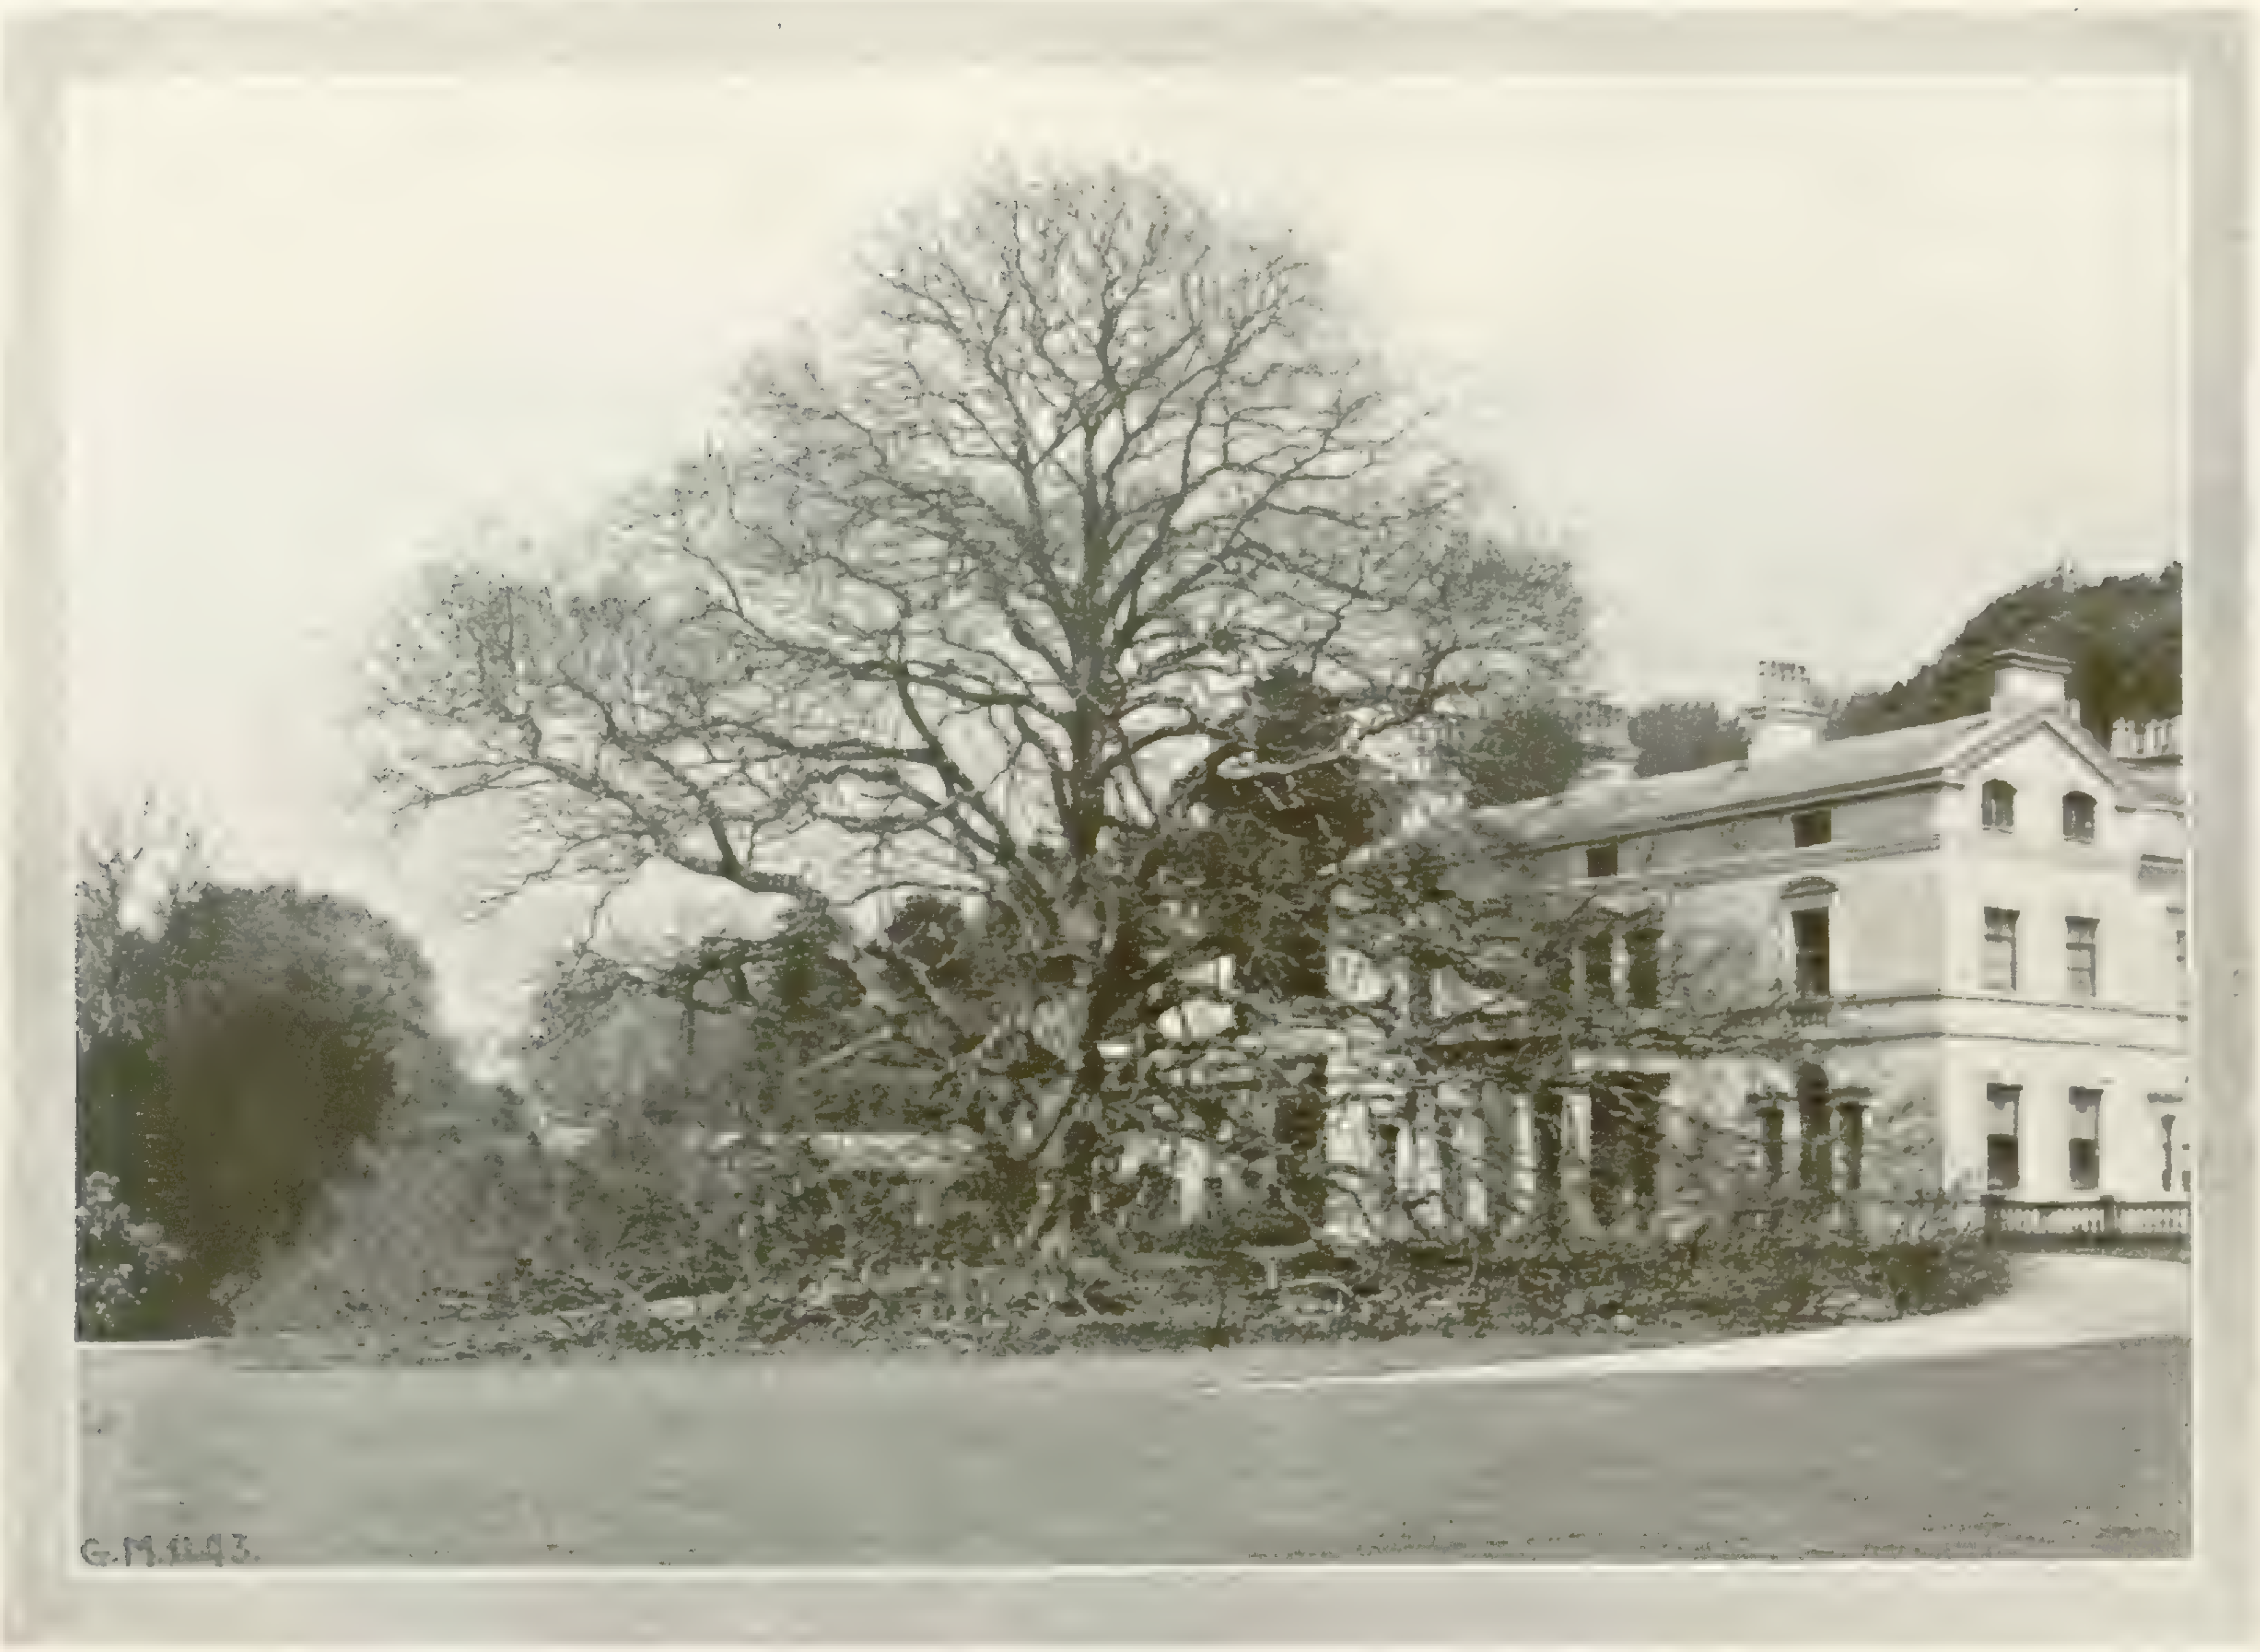
Eltham.

In a visit to Eltham, however short it may be, there is no difficulty in seeing that the owner is well acquainted with rock and other hardy ornamental plants, or of understanding that he fully appreciates their manifold charms, and holds very clear views with regard to the conditions under which they appear to the greatest advantage. There certainly cannot be any doubt upon these points, and as the salient features are recalled to mind, it appears quite impossible to find a garden of similar area wherein the interest could be more varied or the attractions greater than that which Mr. Eden Phillpotts has as a setting to his charming residence.

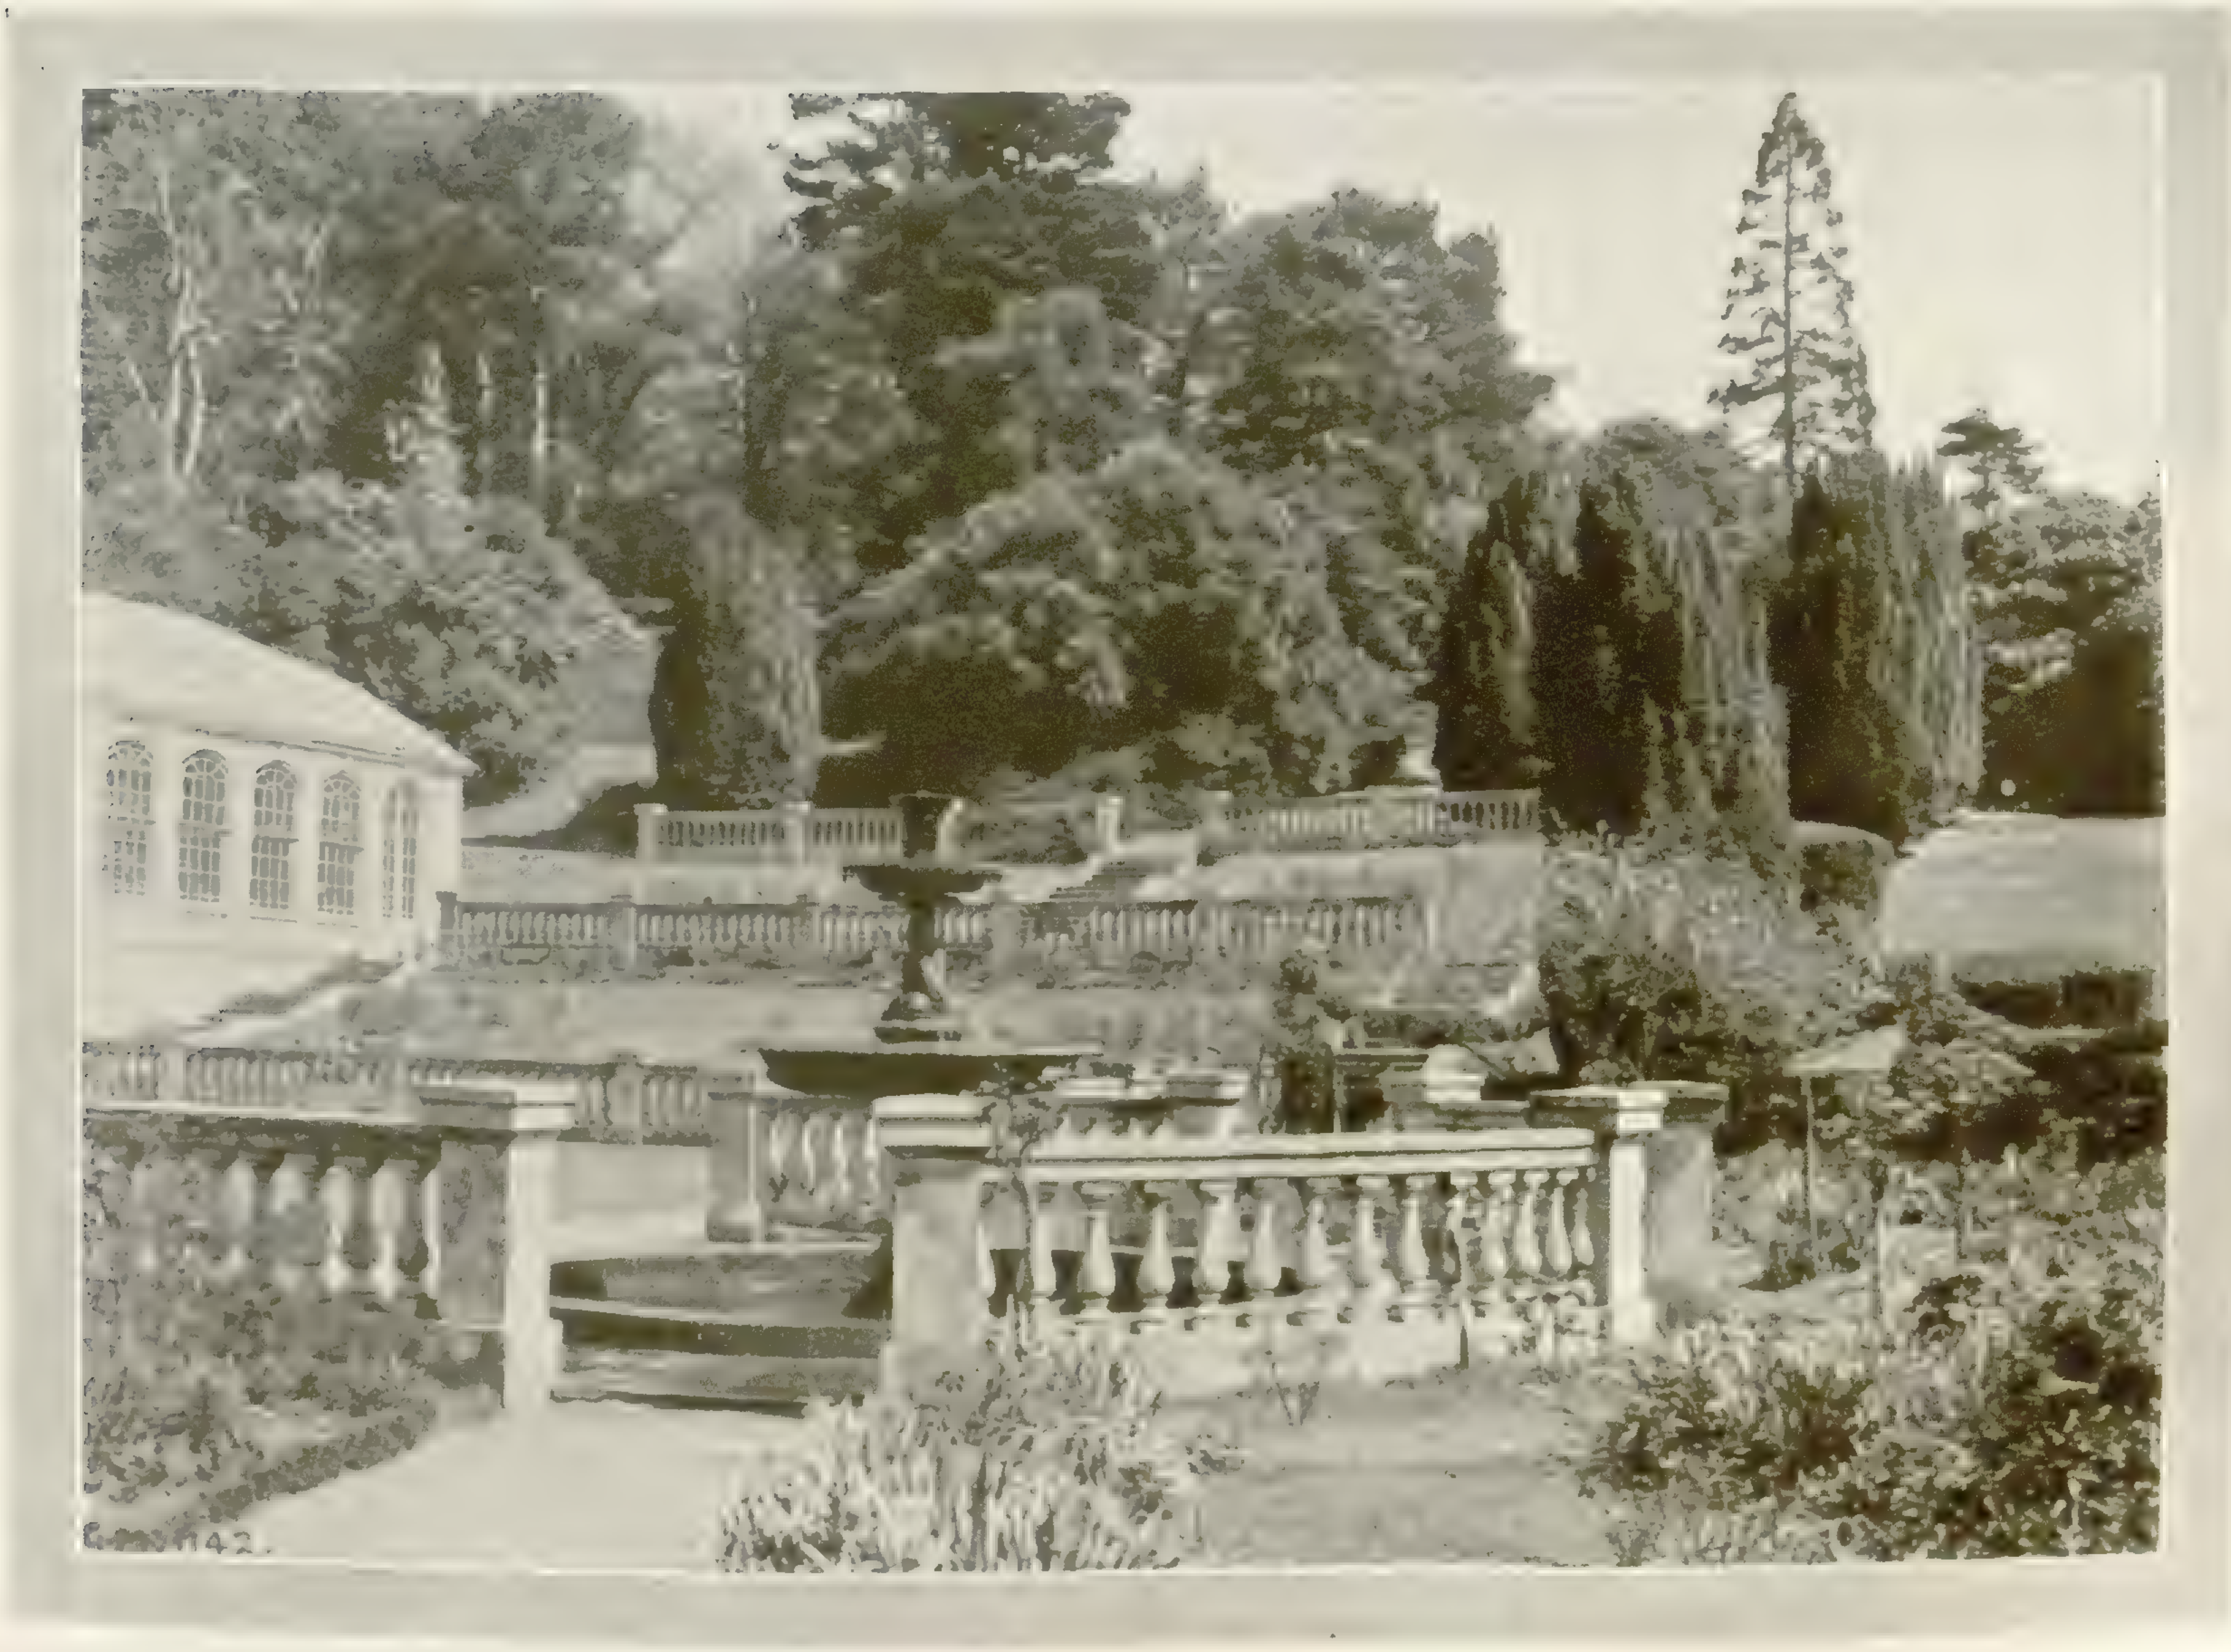
As in so many other instances in and around Torquay, the garden is formed on the side of a hill, with a sharp slope, and whatever difficulty there may have been in dealing with the ground, it was successfully accomplished by forming levels at two or three points, and dealing with them in such manner as to suggest that the terraces and the slopes owed their origin to a desire to provide for the requirements of the plants with which the garden is so tastefully embellished. The residence occupies a site at the higher part of the ground, and therefrom there is a gentle slope, with velvety turf as a covering. At the bottom of this slope is the top of the rockery, which extends the whole length of the house, and rather sharply slopes to the terrace walk. In front of the latter is a border which is supported by a light brick wall, carrying elegant pillars that form admirable supports for the arches over which rambling roses fling their sprays of foliage and flowers in graceful profusion. At the foot of the wall is a narrow border in which various choice shrubs have became established, with a large, finely-kept lawn beyond.

Rock plants and roses constitute the predominant features, and without pausing to enquire which is the more important of the two, it may be said that both are rich in interest and instruction, and contribute their full share to the attractions of the garden. The rockery, of which a glimpse is seen through the openings between the pillars, was so arranged as to afford accommodation for as large a number of plants as possible, but ample provision was made for the extension of the roots, and evidence of this is found in the vigour of growth and the profusion of flowers. In the lower part of the lawn there is a second rockery, not so large as that near the house, but not the less interesting on that account. On the two rockeries there are upwards of one thousand species and varieties, and a finer representation of the denizens of the Alps could not well be desired in a private garden. Certainly few gardens contain so comprehensive a collection, and the success that has been achieved in the cultivation of alpines by Mr. Eden Phillpotts and his skilful gardener, Mr. Sharland, affords an excellent object-lesson on their great value in gardens of somewhat moderate dimensions.

The border immediately in front of the



LUPTON HOUSE—MANSION AND TURKEY OAK.



LUPTON HOUSE—THE FOUNTAIN GARDEN.

terrace rockery is devoted to dwarf and standard roses, and, although the position is naturally hot and dry, they make an excellent growth and bloom freely. Their robust health is probably explained by a deep rich border. That the border has been well prepared, and its fertility adequately maintained is suggested by the appearance of the ramblers, which grow vigorously and give a wealth of bloom in their several seasons. The illustration of the arches represents the roses as they are commencing their growth, and will be more useful in showing the method of training than one representing them at a later stage; but it is only by seeing them when the greater number of the varieties are in bloom that an adequate idea can be obtained of the charming effect that is annually produced. A pleasing feature also is that formed by the lily pond in the lower part of the ground, this having been designed with due regard to the requirements of the water-lilies and also to the needs of the various plants that thrive on the margins of lakes and ponds where their roots can have ready access to an abundance of moisture. Lilies of another kind are also successfully cultivated, and in the season of growth, as the plants approach the flowering stage, may be seen big specimens of Lilium auratum rising to a height of eleven feet, and plants of L. giganteum, with stout stems having a height of between ten and eleven feet. The handsome L. sulphureum and L. Henryi attain to so high a degree of development as to prove a veritable surprise to those who are only acquainted with examples of these lilies of the usual character. On the terrace are fine specimens of Clianthus puniceus, Magnolia grandiflora, and actinidia, which annually bloom with remarkable freedom, and the effect produced in the season of flowering by the great masses of brilliant crimson and pure white flowers must be singularly beautiful.

George Gordon.

*** The second article on the "Gardens Round Torquay" will appear in our issue of the 26th inst.

PILMUIR—ROCK GARDEN AND SUMMER HOUSE.

VARIEGATED-LEAVED CHRYSANTHEMUM.

The editorial answer to "T. M.," Halesowen (page 197), in reference to a variegated-leaved chrysanthemum, brings to mind one which was exceedingly popular 40 years ago. I allude to the variety Sensation, which was distributed by the late Mr. William Bull, of Chelsea, in 1865, and was given a First-class Certificate by the Royal Horticultural Society on June 10 of that year. It was of free growth, and the variegation clearly and regularly defined, each leaf being broadly margined with pale yellow. The flowers were of the pompon type and pure white in colour, but the beautifully-marked foliage formed its claim to recognition. I speak of it in the past tense, for it has, I believe, long since dropped out of cultivation. It is very questionable if any variety of chrysanthemum has since that time proved as remunerative as Sensation, as for a few years it was sold by thousands. The great cause of the popularity of this variety was its advent just as the ribbon border craze of flower-gardening became very acute, and this variegated-leaved chrysanthemum proved itself an ideal subject for this purpose. The late Mr. John Wills, one of the pioneers of this phase of garden decoration, used the variegated chrysanthemum largely, and his lead was followed by many who aspired to meet with similar distinction in that particular line. Carrying one's thoughts back to the time indicated, no regret need be felt that the embellishment of our gardens is carried out in more rational manner than when the available space was simply occupied with long lines of colour.

W. T.

THE CORNELIAN CHERRY.

Among large growing shrubs this is one of the showiest in February, for during the latter half of the month it is covered with its small yellow blossoms, which create an effective display, especially on a bright day. Scientifically, the Cornelian cherry is known as Cornus Mas, while it may be occasionally found in gardens under the synonym of C. mascula. Under favourable conditions it attains a height of 16 or 20 feet, with a wide spread, but it may be kept lower by drawing out the strong leading shoots occasionally. The leaves are oval and of no ornamental merit. The flowers are borne in small heads from most of the axillary buds, and they are succeeded by oval fruits, which, when ripe in September and October, are scarlet in colour. It is a good shrub for a back place in a shrubbery, a mass in the wild garden or a group on the outskirts of a plantation, and rarely fails to give a good account of itself.

There are several varieties with variegated leaves and others whose fruits show a variation in colour from the type. The former are the most conspicuous, and good ones are aurea elegantissima and variegata. The latter is the more vigorous of the two, and has pretty silver variegated leaves, which keep their colour well throughout the hottest summer. It is a good shrub for a conspicuous position. The other has golden variegated foliage, but is a less vigorous shrub, though handsome when at its best. The type is a native of most parts of Europe and some parts of Asia. Its wood is very strong, and its branches are used for walking sticks, while those of greater dimensions are made into forks for various agricultural purposes in some Continental countries.

Kew.

A CHAT ABOUT FRUIT CULTURE.

At the present time, when many persons in this country are turning their attention to the land, and the possibilities of rearing a healthy, thrifty people on it, the Colonies are not idle, inasmuch as some of their best representatives are in England at the present time setting forth the great possibilities that doubtless do exist in certain localities, more especially in the vast regions of Canada, for those who possess capital, and the necessary knowledge, and a healthy desire to apply these in a proper form.

I have listened with much interest to the clearly-explained possibilities that lie in front of those who would take up fruit growing in British Columbia, for instance, and have also admired the lecturers for telling us that it is not our undesirables they are craving for, but those who are prepared to take sufficient capital to tide them over the initiatory stage of such undertakings. From the excellent fruits of British Columbian apples seen at various shows during the past few seasons, one is prepared to affirm that they are excellent in every way, carefully graded, splendidly packed, without outward blemish of any description, and each variety true to character. We have been told that in no other country (certainly not in England) can such a high percentage of first quality fruit be obtained, and one cannot altogether dispute this point. But we do know that fruit growing in some of the districts is in its infancy, and that youth has a great deal to do with the standard of quality; as the trees become older and the soil more exhausted, and the branches damaged, so the percentage of A1 quality must recede after the trees have reached their maximum stage.

PILMUIR—A RAVINE IN THE ROCK GARDEN.

The time is coming in England when because a person takes off his coat to work he will not be considered incapable of higher thinking and organising powers, and there is not the slightest doubt that if those who go to the Colonies were only prepared to do with less of the social side of life at home, and would work with the same will and sacrifice, be it fruit production or anything else, they would succeed.

When one goes about inspecting trees here and there, it seems deplorable that in a country like ours there should be hundreds of acres that are a disgrace to any nation, and a serious menace to those who would like to do better but are overshadowed by fungoid and insect pests: and no one may take steps to condemn such injustice being done to a neighbour.

There are in England to-day hundreds of acres of land yielding next to nothing that would grow apples to perfection, but if money is to be made it must be in planting thousands of one variety, more especially those varieties that will keep for some months. For market purposes it is the height of folly to grow a few trees only of what are supposed to be the best varieties, and which scarcely anyone agrees about. For private use, and in large establishments, a few more varieties are necessary, but from experience I am convinced of the futility of planting a few trees of possibly a hundred varieties for really practical purposes. They are a serious hindrance, and a positive nuisance at storing time, and next to useless should it be necessary to market the fruits, as is sometimes the case in private establishments.

I am often sorry for the gardener, as regards the fruit trees he is called upon to tend. It often happens that the owners know nothing about the laws that govern tree life, more especially fruit tree life, and men often find, on taking a fresh situation, that the trees are old, or, if young, have been seriously mismanaged. I may be wrong, but, in my opinion, every man should know something about the building up of fruit trees, and be intimately acquainted with stocks and their influence. One can learn so much more by training a few trees oneself, not only their heads, but their roots also, and it is these latter that are the key to the successful treatment during the first five or six years of a tree's existence, and upon the treatment then accorded will depend the future success.

I might say a few good words for our best fruit growers, because they spare no pains to keep their stocks healthy, and by the frequent removals their stocks are subjected to, a fibrous root system is encouraged which has a beneficial effect upon the tree for life. So much depends upon the right kind of stock, and the manner in which that stock is managed, even before the process of budding is performed. When buying trees I would far rather, had I the choice of very vigorous trees or those of moderate growth, take these latter, as being likely to produce the best results after removal. I have sometimes been prevailed upon to buy trees I have not seen, and from sources practically unknown, these being offered as "better than can be had from any other source at the same price," but, on arrival, have frequently found that the true principals of fruit tree formation are ignored for the sake of wood production and a "big tree."

I have seen cordons of three years' growth with not a sign of blossom, and with roots that have certainly never been moved since before the bud was inserted. However, our best fruit tree producers never lose sight of the destiny of their trees, and cordons that will have fruit buds in their second year may be bought in quantity from any reliable source. For producing first quality fruit, either for private or market use, there is nothing like plenty of cordons and dwarf bush trees; these latter, when properly managed, will bear from 25lb. to 35lb. of fruit per tree at seven or eight years from the bud or graft, in the larger varieties. If trees are two or three years old on the paradise stock when purchased, by the time they are six years old (if properly treated on their arrival from the nursery), they will, in good garden soil, require to have been bodily lifted at least twice, have their roots severely shortened, and be firmly replanted. Trees managed upon these lines will not require as much pruning, as the branches will be studded with fruit buds, and, usually, the only growths that produce shoots are the leading bud for extended growth, and the two immediately below it. Surely it is a saving of labour and a profitable investment when trees are brought into early bearing by cultural management, and until one practices various ways and means to attain some object one cannot truthfully say that they are not practicable, or suited to their case.

ELTHAM—ROSE ARCHES ON THE TERRACE.

Everyone knows that a tree moved from one portion of their garden to another, and carefully planted, will be little affected, more especially in the case of apples on broad-leaved English paradise stocks. The case, however, has a totally different bearing when trees come a long railway journey, are mutilated or broken at the roots, and have been dry for nearly a week. These sustain a severe loss of energy, and unless something drastic is done to bring about the right conditions for growth, the young trees bought with such high hopes will not prove a blessing.

Notwithstanding all that has been said, and written, in England of late years in connection with this question, it is still a fact that thousands of young trees are annually ruined because the owner does not bring to bear upon them a few simple common-sense rules. It is frequently the soil or the climate that are at fault, or so it is stated by the owner, and if one tried to convince him that it was his own judgment at fault the attempt would fail.

Although growing a goodly number of both standard and bush trees, I prefer the latter for quality and quick returns; they are easy to prune, and to gather from, and handy for applying washes as preventives of insect pests and fungoid diseases. Where horse labour is cheap much may be done with trees on crab or seedling apple stocks as the ground between may for some years be deeply cultivated, and a system of intercropping pursued without in any way doing damage to the trees, the cropping may be of annual duration, or may take the form of bush fruits, which are easily propagated by the thousand. I should like to see every farmstead in England remodelled as regards its fruit trees, because, with the natural conditions of farm life, and horse labour for cleaning the land, if the residents understood anything of fruit growing, they would find a few acres of fruit trees a source of profit. There are a few who are gradually increasing their fruit quarters yearly on land they have acquired, and the general farm crops are growing fewer on that account. I am quite convinced the only way to become fully acquainted with the management of fruit trees of any description is by studying them carefully, root and branch, from their earliest stages, and as each tree requires individual treatment, so it must be understood at pruning time by those in charge. If owners of gardens only knew the value of well-trained young trees, we should soon find many of the old specimens that are now kept to grow wood and moss converted into ashes, and thus brought back to the land in a useful state. We grumble at the farmer because he does not spray his trees, and go into scores of otherwise well-kept gardens, where the employers will not spend the few shillings necessary to free the garden walls and old trees of their living freight of pests.

Guildford. C. Foster.

A SUCCESSFUL LADY GARDENER.

Mrs. Towers Mynors, of Berry Hill, Tixall, near Stafford, is a lady who, starting a short time ago as an amateur, can now fairly claim to rank as an expert. In a garden of just over half an acre, with a greenhouse 20ft. by 12ft., and a frame, the whole of which she manages herself, she always has a fine lot of pot plants, hardy flowers, and vegetables. She is particularly successful with cyclamen, cinerarias, primulas, tuberous begonias, freesias, and herbaceous calceolarias.

The frame is filled in September with strong clumps of double blue violet (Marie Louise), from which a good bunch can always be picked from that date until April. After then the frame is wanted for hardening off plants for flower beds and window boxes. In summer it is filled with seedlings to be grown on later in the greenhouse, and then the frame is again used for violets. The garden walks are spanned at intervals with rustic arches covered with roses of the rambler type, which add greatly to the beauty of the garden in July. The herbaceous border is planted with a choice selection of hardy plants in up-to-date style, indeed the whole garden forms a fine object-lesson of what can be accomplished by an enthusiastic lady who devotes her attention to horticulture.

OUTDOOR TOMATOES.

With the introduction of new tomatoes of a more precocious character than we had formerly, much has been done to encourage open-air cultivation of these fruits. We have now sturdy, free fruiting kinds far in advance of those of a few years ago, when our earliest tomatoes were chiefly of the corrugated, or ribbed, type, which detracted somewhat from their appearance whether for private consumption or for market. The ribbed appearance seems to be a characteristic of the very earliest croppers, and although we have now almost succeeded in obliterating that peculiarity, I have noticed at times it will still show itself, though it is quite possible that a too gross or luxuriant growth may be responsible for this reversion to the original shape, though such reversions may often be seen in winter-fruiting tomatoes.

To obtain good plants for outdoor culture, seed should be sown early in March; if sown earlier they become stunted and starved before the weather is warm enough to risk putting them out, so that there is nothing gained by being too early. The plants start away much better if unchecked before planting. It is essential for success to have well-established plants previous to planting out, for the better and stronger they are the quicker will they commence to fruit and ripen. In our variable summers outdoor tomato culture is something of a speculation, therefore every encouragement should be given the plants during June, July, and August, and also during September.

Our summers are far from being favourable to the fruiting and ripening of tomatoes growing in open quarters, and while many are planted with the expectation of securing crops, such expectations are not always realised. The summer of 1909 proved the speculative character of outdoor tomatoes, therefore every warm place on houses, or suitable aspects on walls, should be utilised for tomatoes.

The system of growing the plants will be similar to that recently advised for indoor culture, viz., the cordon system. If the tomatoes have been grown steadily, and moderately cool, then the end of April and the early part of May, in the warmer localities, will be soon enough to put them out against walls, and May or June, according to situation, for planting entirely in the open quarters. Good plants should be put out in either positions, and if they are well established, showing the first flowers, a considerable gain will be made towards cropping.

The culture after planting will consist of the removal of all lateral growths as they appear, keeping each plant to a single stem. The amount of crop produced will depend on the season and position, but it is a waste of energy to allow fruits to be formed which can never be ripened, therefore, as the season advances, the leader should be stopped to hasten the ripening of the crop, while the fruits that cannot finish outside may be gathered and fully ripened on a warm shelf indoors.

In many private gardens there are vegetable frames or pits, and these, if not required for other purposes after the early crops are lifted, can be utilised for tomatoes with a large measure of success. Such places also relieve some of the houses that may have to be used for earlier crops of tomatoes. The treatment recommended for house culture will suffice for frame plants.

The selection of varieties is always an important point, and herein there is no lack of choice; evidently there are no bad tomatoes, and safety does not depend so much on variety, as on suitability. There has been much endeavour to produce an early variety for outdoor culture, but the very earliest are not quite the smoothest fruited, and the smooth fruits of attractive appearance are demanded nowadays. Outdoor, Sunrise, Dwarf Red, Hipper I., Stirling Castle, Up-to-date, and all the small or ornamental varieties given in the recent article on "Summer Crops of Tomatoes" are among the best for outdoor culture. The smaller-fruited varieties are very suitable for the cooler conditions.

T. H. Slade.

SOME USES FOR SWEET PEAS.

The immense popularity of the sweet pea as a vase and bouquet flower is a thing apart from its fame as an exhibitor's blossom. There is another manner in which it is entitled to be highly valued, however, and that is as a garden ornament.

Instead of viewing an annual that requires to climb as an untidy grower, let us see what can be done to show it off to the best advantage, and yet make it add to the effect of the pleasure grounds. To begin with, banish the usual pea stick; it is the too wide practice of training sweet peas upon this that has caused it to be relegated to the kitchen garden, or placed in rows and groups in reserve beds. Single plants tied up to a slender bamboo cane each make excellent pillars, and enable the real grace and beauty of stem, foliage, and bloom to be fully appreciated. It should be remembered that Mr. Brotherston, a noted Scottish grower, gave similar advice some years ago. He counselled: "Grow the plants singly, allowing each plenty of room. If you are able to get plenty of good loam, allow each plant one and a-half barrowfuls, and of leaf-soil half a barrowful, incorporating these with the top spit of the garden soil."

In no other way can the sweet pea plant be fully shown as an individual instead of a member of a crowd. Those cultivators who wish to discover whether certain varieties that seem much alike really possess points of difference, cannot do better than adopt this method. Rows of bamboo-trained sweet peas, the pillars wide apart, make a beautiful background to a border of low-growing annuals against a fence, or not far from wall or trellis covered by roses, or may occupy the middle row of borders and long-shaped beds in the open.

This style of growing has, therefore, a distinct decorative value; it is not calculated, though, to display the sweet pea as a colour producer; probably a hedge of one variety is the best means of achieving this, except in the few gardens in which there exists a large dell that can be planted at summit, base, and all up the sloping sides, with a scarlet, rose, blue, mauve, or orange variety. By utilising the slopes the heads, or chiefly flowering tops of sweet pea clumps are congregated on slightly differing levels, so that a bank effect of bloom is gained, and lower stems remain hidden. Some terrace slopes look well similarly treated; the lowest sweet peas must show their stems, of course, next to the path, but it is a good plan to use a row of the dwarf Lathyrus sativus azureus, the sky-blue miniature pea, to minimise the bare look that will otherwise displease the eye solely by its excessive contrast with the massed blossom show above. There is a pure white Lathyrus sativus that should be useful in places where the sweet peas are mauves, or blues, with which azure would not harmonise, but I am not able to state from experience whether it is as dwarf as the blue.

Hedges of sweet peas do not demand the usual faggots: a capital support can be made by bamboo canes at intervals, with five or six horizontal lines of string stretched taut between, and some vertical strings tied up these, ending in wooden pegs in the ground; up the latter strings the young tendrils will cling quite as readily as to the fine twigs usually given for their first hold.

There is no rivalling the colour of an orange sweet pea, massed in full sunshine, with a surrounding of green turf; every man may choose his own favourite variety, and thus fully prove its non-fading character. The hue is more striking than scarlet, because we have so many flowers of various heights that supply vermilion, or blood-crimson; the same may be said of rose and mauve, white, cream, and maroon, as well as the sweet pea shades of blue. Salmon varieties are also exceedingly valuable for garden effects.

Sweet peas for front gardens were unheard of a few years ago, once more because the faggots were, perhaps rightly, considered so uncouth. Hedges, trained on wire, bamboos, strings, or, as I have seen successfully carried out, over sweet briar hedge foundations, may well flank the tradesman's path, making, as they will do, gorgeously blossoming screens of four to six feet height. A free use of the handsome tall galvanised sheep-wire supports, sold for the purpose, in bed centres, and as lawn pillars, will further improve front gardens, while the employment of the sweet pea as a summer climber to cover bare stems of permanent subjects, such as roses, clematises, and ampelopsis, cannot be too strongly advocated. Many house fronts or verandah pillars, archways, trellises, or summer shelters show these leafless old trunks of well-established climbers, and against them, in an adequate measure of new soil, the sweet pea is willing to flourish. Mauve peas, with yellow roses, blues with pink, cream with red, white with crimson, salmon with purple, offer some beautiful harmonies.

There is an airy grace, a summer softness of look about these flowers that can only be fully observed when the plants are perfectly trained and flourish in full healthfulness; of this truth every cultivator should show himself to be aware, and surely garden occupants that are with us for so many months deserve every effort from the grower. It has been truly and poetically said:

> "O blossom poised for flight,
>   Yet resting still
> That butterflies may light
> In quivering delight
>   Just when they will.
>
> O colour-petals rare,
>   Rose-blushing, red,
> White, azure, each more fair;
> Summer remains our share
>   Till thou art shed."

M. H.

Ivy Growing on Walls should now be trimmed back, and the trimming should be done somewhat severely if the walls are to be kept neatly furnished. The old stems and growths adhering to the bricks or stonework will soon produce an abundance of young foliage, and ivy-clad walls so treated afford little harbour for sparrows or other undesirable vermin, and at the same time there is less risk of the ivy breaking away from the wall by an undue weight of lateral growths.—W. Hedley Warren.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLINGS.—It is advisable that seedlings which have been either in store or seedling pots should have attention, and be repotted, if necessary, as early in the season as possible. The aim of all hybridists of the present day is to shorten the period between the time of seed-sowing and flowering, and with this end in view the plants should have every encouragement. A few years ago a season's growth and a regular period of resting were considered the correct method in so far as they imitated Nature, and the fact that the plants were being treated under artificial conditions was for many years overlooked. This system of resting simply retarded the growth, and in those cases where the plants had filled their pots with roots, simply resulted in starvation, and there was very little advance in growth for many years. We have gained by experience, and now we treat our plants differently, and, by affording them practically the same treatment as that given to seedlings of other plants, we are enabled to obtain far more satisfactory results within about the same period as that required to bring the bulbous plants to a flowering stage.

SEPARATE POTS FOR SEEDLINGS.—In dealing with seedling orchids I have, as most of the readers of the Gardeners' Magazine are aware, advocated putting plants into separate pots at the earliest possible moment. I consider that the requirements of the individual can be thus more readily attended to than is possible under the collective treatment, where several are pricked out in the same pot. The question of room is frequently a serious one, and it is when one is compelled to prick out several together in pots that we are able to observe how frequently the "survival of the fittest" works out during the winter season.

COMPOST.—In the case of cattleyas and allied genera we find that a suitable compost consists of equal portions of fibrous peat, polypodium, broken leaves, and chopped sphagnum, with sufficient sand and broken crocks to keep it open. This must be varied in coarseness according to the size of the plants and pots used. It is not advisable to pot too hard in the early stages of growth. For seedling dendrobiums little else is desirable than finely-chopped moss with a little fine peat and ample sand added. Care must be taken that the sphagnum moss is fresh when used. For odontoglossums the same compost as that advised for cattleyas we find suitable; here again potting should be done lightly, it is quite time enough to resort to firm potting when the plants are nearing the flowering stage. For phaius, cypripediums, calanthes, and most of the terrestrial orchids we add a little fibrous loam, and, to render the compost porous, add a liberal sprinkling of finely-broken crocks. The pots in all cases should be thoroughly clean and drained to about one-third their depth.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

FORCED SHRUBS.—As soon as these have finished flowering pick off all seed vessels and remove the plants to a warm house. Frequent applications of liquid manure will help to develop growth, and syringing twice a day will keep red-spider in check, and also assist leaf and stem development. When growth is completed and hardened, plunge the pots out of doors in ashes, or stand in a cool situation, but never allow the soil to become dry.

SALVIA SPLENDENS.—Plants that were cut back some time since will now have furnished plenty of cuttings, and a batch of these should be rooted now. Seedlings are, however, the best, and can be raised in a few months.

PRIMULAS.—These will now be ready for picking off into a mixture of good loam and peat, with a liberal quantity of sand added. Use 2½in. pots, and keep near the glass for a week or two.

VALLOTA PURPUREA.—These beautiful bulbs, which frequently thrive luxuriantly and flower abundantly in cottage windows, are, curiously enough, often the despair of the gardener. Healthy plants, not too pot-bound, should be merely given a top-dressing. Repot the others in a mixture of fibrous loam, leaf-mould, and sand. Use comparatively small pots, and do not press the soil too firmly. All the plants should be placed in a light position while making their growth; keep the surroundings and the roots moist. When they have completed their growth remove to a cool frame.

CLIVIAS (Imantophyllums). — Specimens coming into flower should have copious waterings. Frequent applications of liquid manure are essential during the period of growth. Those in large pots do not often require potting. Large plants needing attention may be divided, and they will furnish a quantity of useful plants of smaller size. After dividing and potting, place them in a warmer house, and syringe overhead to encourage growth.

SUCCULENT PLANTS.—All the species of cacti which during the winter have been kept dry at the roots will now be showing signs of new growth. This is the best time for carrying out any necessary repotting. As the plants thrive and flower best when grown in comparatively small pots, it is not necessary to repot healthy specimens every year. When it is necessary to repot these shake the greater part of the old soil from its roots, examine them carefully, and cut away any damaged portions; cacti are not greatly affected by rather severe root-pruning. Good fibrous loam and sand, with plenty of broken brick rubble or limestone, is a satisfactory compost for most succulents. Tall plants and those with weak stems will require to be supported with a stake.

CAMELLIAS. — These will now require a slightly-higher temperature and a moist atmosphere. They should be syringed twice daily to keep the leaves clean, and when those not planted in beds and borders have finished their growth remove them to the open air. Freely ventilate the house when growth is finished. — W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

BEDDING PELARGONIUMS and similar plants have by this time been potted off, and have made new growths; the latter, if removed and inserted in shallow boxes of sandy soil—or singly, in pots—and placed in a warm house will soon strike if kept rather dry, and make as fine plants as those struck in the autumn; in fact, often better, if carefully grown on for a few weeks in favourable quarters.

DAHLIA ROOTS that were potted a few weeks ago are now throwing up cuttings in abundance; these, when about three inches in length, might be taken off with a small piece of the old tuber attached, inserted singly in 2½in. pots, and plunged in a temperature of about 70 deg.; the cuttings should be well watered in, but care be afterwards taken to prevent damping off. If a propagating case is used, the light should be wiped daily, and all superfluous moisture thus removed. So treated, roots will form in about a fortnight, after which the plants should be removed to a shelf near the glass in a temperature of about 65 deg. Other dahlia roots not required for propagating purposes might be started in a cooler house, and grown on slowly before being planted out in May or June.

ROSES, both dwarf and standard, may now be pruned during favourable weather, leaving the teas, or other tender varieties, until last. Remove all weak or unripe growths, and prune back to the early-formed buds of last season's growth, or to well-ripened wood. When dealing with the climbing section it is usually considered best to remove most of the old wood that has flowered during the previous season and to shorten back all weak growths, retaining only the strongest and best for furnishing the walls or trellis, as the case may be.

SHRUBBY CALCEOLARIAS growing in frames should receive a good watering before being lifted and transplanted into other frames or pots; if in frames plant out four inches apart each way, as this allows space for lifting the plants with good balls of earth at planting-out time. Shade for a time, if necessary, and as soon as the plants renew their growth, pinch out the points to keep the plants dwarf and bushy.

GENERAL.—Advantage should be taken of dry days to complete the planting of the herbaceous borders; this operation has been unduly delayed through the wet weather, and the consequent unworkable condition of the soil. Asters, stocks, zinnias, etc., may be sown in gentle heat; shade from bright sun, and keep the soil uniformly moist until the seedlings are well through the soil, then remove to cooler quarters, or, if growing on a slight hotbed, on warm days remove the lights, or otherwise admit plenty of air into the structure. All outside borders should now be made ready for sowing the main batch of hardy and half-hardy annuals early in April; if the borders are exposed and dry, dig in an extra quantity of well-decayed manure.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

GRAFTING.—If not already done, those fruit trees that require regrafting should be headed back, as advised in a previous calendar. Fruit trees generally in this locality are in a forward condition, and grafting will be undertaken from now onward. Some varieties being ready before others, the most essential point to remember in grafting all fruit trees is not to undertake this work unless there is a free circulation of sap in the stocks that are to be operated upon. Rind grafting is the method usually adopted when dealing with large trees. The scions must be tied firmly and well covered over at the base with grafting wax.

PROTECTING FRUIT BLOSSOM. — The prospects of good crops of fruit are all that can be desired in this locality; but owing to the heavy rainfall and the mildness of the weather throughout February the fruit buds are much too early for a good crop; we certainly shall experience some frost and cold winds this month. Peaches, nectarines, and apricots, on walls, that have been tied in bundles to retard their flowering should have their shoots nailed or tied-in without delay. All protecting material should be made ready to place over the trees when in bloom; double fish-netting, tiffany, or canvas can be used to ward off frosts and cold winds. The protecting material should be fixed to the top of the coping on the walls, and arrangements made so that it can be raised during bright sunny weather and lowered again at night. Some means should also be provided, so that the material will not rub against the blossoms.

FIGS.—The pruning of fig trees can still be done; the knife should be used sparingly upon the ripened wood, removing only exhausted or unripened shoots. The fig will grow in any soil that is not too rich, and where plenty of old lime rubbish or chalk has been mixed freely with it, plenty of drainage should be provided for the roots, as they require a considerable amount of water when the fruit is swelling. The soil should be made firm and the rooting area confined to a limited space; this has the effect of checking the strong growths, which are so characteristic of the fig; it also materially assists in the ripening of the wood and the production of good crops. Figs succeed remarkably well when planted on south walls in narrow borders beside the paths; and two varieties which succeed well here are Brown Turkey and White Marseilles.

STRAWBERRIES. — New plantations should be made without delay. Choose a fine day, when the soil is in a good working condition.—Henry R. Farmer, Cardiff Castle Gardens.

EXHIBITIONS AND MEETINGS.

◆

United Horticultural Benefit and Provident Society.

The annual general meeting of this useful society was held at the Royal Horticultural Hall, on Monday, March 14, at eight p.m., Mr. Charles H. Curtis presiding. The attendance was small, and this may be taken as evidence of the steady progress and general excellence of the working of the society, because, if there is anything of a controversial character, new rules, etc., the members turn up in large numbers. Nevertheless, remembering the excellent work done month by month and year by year by the officers and committee, those members who are within easy distance of Vincent Square (and there are about two hundred who are) ought to attend in larger numbers, and show their appreciation of the good work done without fee or reward; indeed, done at personal expense.

After the usual formal proceedings, the report and various balance-sheets were presented. Of these latter we select the treasurer's statement for the year.

REPORT OF THE COMMITTEE FOR 1909.

In presenting its report for the year 1909, together with the balance-sheet for the same period, the committee has much pleasure in recording steady progress in membership and in financial matters.

Sixty-five new members were elected during the year, but as twenty-four members lapsed and seven died, the net increase is thirty-four, the total membership now standing at 1,325. One of the deceased members was Mr. Nathan Cole, who in the earlier years of the society's work was a member of committee. The amount paid out to nominees of deceased members was £300 10s. 11d., this sum including £30 4s. 1d. paid to the nominee of a lapsed member.

The sum of £9 7s. 2d. has also been paid to lapsed members on reaching sixty years of age.

Subscriptions to the benevolent fund amounted to £231 3s. 4d., and the payments therefrom to £129 11s., the latter amount including the sums regularly paid to several members over seventy years of age, as well as a few grants made to members in great distress.

The Convalescent Fund does not thoroughly fulfil its mission, and the committee believes that if members recovering from severe illness would take advantage of the benefits it offers there would be a material reduction in the amounts paid out during sickness. Members often return to business before fully recovered, and consequently have sometimes to come again upon the sick fund, whereas a brief holiday and change of air following sickness would fully restore them. The subscriptions to this fund, including £5 5s. from Mr. N. N. Sherwood, V.M.H., amounted to £10 2s., and the one grant from the fund was £1 10s.

The management expenses have been kept as low as possible, consistent with the proper working of the society. There has been no special or extra expenditure of any kind, and the total management charges amounted to £195 11s. 10d., as against £192 19s. 10d. in 1908.

The annual dinner was held in October at the Waldorf Hotel, when Mr. J. B. Slade (of Messrs. Protheroe and Morris) proved a most able chairman, and set forth the benefits of the society in a very lucid manner. Unfortunately the weather was against a large attendance, but those present spent a very enjoyable evening, thanks to Mr. Slade, and to Mr. T. Winter, who once again superintended the musical arrangements. Mr. Slade became an hon. member, and also introduced Messrs. J. Rochford and J. Russell as hon. members.

The question of providing for a grant to any member who may have the misfortune to lose his wife by death has been considered by the committee, but as there are many points of far-reaching importance involved in any such new departure on the part of the society, the committee proposes to take actuarial advice before putting any proposals before the members, and to take such advice in connection with the forthcoming quinquennial valuation of the society.

The many benefits attaching to membership of the society are well known to the members themselves, although not all of them, as already pointed out, are taken full advantage of. But if the society is soon to hold that large place in the horticultural world it is meant to fill, then there must be greater effort on the part of private members. In return for a payment of 9d. per week a member receives 18s. per week for six months if continuously ill for that period, and 9s. per week for a further six months if still ill (12s. and 6s. respectively if the subscription is 6d. per week). In cases of chronic sickness 6s. and 4s. per week respectively is granted, and, should a member be unable to follow his employment after attaining the age of seventy years he receives a sum varying, according to circumstances, from 5s. to 8s. per week. After reaching sixty years of age a member may withdraw a sum equal to double the amount of the interest on his deposit account, in any one year, and thus, in times of stress be able, in many cases, to pay his contributions to the society from the amount standing to his personal account in the books of the society.

In short, the society provides for sickness, makes provision for chronic illness, renders aid to the distressed, credits each member with a due proportion of the surplus funds, helps the convalescent, and cares for the feeble and aged. Every member should act as a missionary of the society, and continually preach the gospel of thrift and self-help with intent to secure new members. The financial stability of the society is beyond question.

During the year four children of deceased members have been elected to the benefits of the Royal Gardeners' Orphan Fund, and the committee therefore commends this excellent charity to the society. A subscription of 5s. per annum entitles a subscriber to one vote at each election, and if a large number were to subscribe the election of children of deceased members to the benefit of the fund would be practically assured.

In conclusion, the committee begs to once more acknowledge the kindness of those who, as honorary or life members, or in other ways, assist the society and help to extend its usefulness and sphere of influence.

CHARLES H. CURTIS (Chairman),
WILLIAM COLLINS (Secretary).

TREASURER'S STATEMENT FOR 1909.

Dr. RECEIPTS.		£ s. d
1909. January 11th.

The Chairman moved the adoption of the report and balance-sheets as presented, and in doing so reviewed the work of the society during the past year. He drew attention to the auditors' note, which was to the effect that, while the investments of the society amounted to £35,800, the approximate market value of these was about £32,400, or £3,400 less than the par value, but towards this difference there was a depreciation fund of £2,251 8s. The Chairman pointed out, however, that, although this depreciation fund was an excellent safeguard in case the society was compelled to realise any of its investments, yet the investments were mainly in Corporation stocks that were redeemable at par many years hence, therefore the society was in a doubly strong position, as it had purchased in most cases a good deal below par. He also pointed out that, though the investments were £500 lower in 1909 than in 1908, this was due to the fact that within a few days of the end of the 1908 financial year a block of stock was purchased at a low rate, whereas at the end of 1909 there was a balance of about £700, including £200 on deposit, and £100 had already been invested in 1910, so that the difference was more apparent than real.

Mr. Burge seconded the motion. Mr. Price and Mr. Mark Webster spoke, each expressing a hope that the members would bring the advantages of the society before the members of horticultural or gardening societies to which they belonged, and pointed out that they and others were members, because Mr. Burge had on several occasions explained the whole working of the society at Beckenham. Mr. Webster also urged that something be done to further advertise the society, especially as there was a balance to the good on the dinner and advertisement account. Mr. J. Harrison Dick moved a recommendation to the committee to the effect that steps be taken to advertise the society at gardeners' meetings and horticultural societies. The Chairman said that a detachable nomination form would be placed in the report when sent to members, in the hope that each member would, through it, secure at least one new member, and a young member for preference. The motion was then put and carried unanimously, and the meeting decided to print 3,000 copies of the report, balance-sheet, and list of members.

The election of four members of committee was then proceeded with, and the retiring members, Messrs. Woods, Harding, Harrison Dick, and Wilson were all unanimously re-elected. Mr. W. Collins was unanimously re-elected secretary, and several members eulogised his services. Mr. Collins has been secretary for twenty-three years. Messrs. Gunner and Puzey were again elected auditors of the society's accounts.

Votes of thanks were then passed to the trustees; to Mr. W. P. Thomson, the treasurer; to the committee; and to the horticultural Press. Messrs. Winter, Hill, Bedford, Burge, Stambridge, Hawes, J. H. Dick, Price, Webster, Wheeler, and Thomson took part in the proceedings, which were all of the pleasantest possible character. A vote of thanks to the Chairman concluded the meeting.

At a subsequent committee meeting Mr. Charles H. Curtis was again re-elected chairman of committee, and Mr. Thomas Winter was re-elected vice-chairman.

Farewell Presentation To Mr. James W. Laird.

A large number of the horticultural friends of Mr. James W. Laird, of the firm of Messrs. Laird and Sinclair, Lim., Dundee, met him on the evening of the 4th inst., in Wood's Rooms, Commercial Street, to honour him on the occasion of his leaving for America, where he purposes making a home in Virginia.

W. S. Melville, Esq., J.P., the esteemed president of both the Dundee Horticultural Society and the Dundee Chrysanthemum Society, presided, and was supported by the leading nurserymen, seedsmen, and gardeners of the district.

Loyal and patriotic toasts having been pledged, the Chairman proposed that of "Our Guest, Mrs. Laird, and Family"; and, in doing so, said that the country was suffering grievously by the loss of such men as Mr. Laird. It was poor consolation to say what was Britain's loss was America's gain. In wishing them Godspeed in the land of their adoption, and from the bottom of their hearts praying for the best blessings a good God could bestow, he trusted that they would soon be surrounded by a coterie of friends equally as devoted as those with whom they were now parting.

On replying, Mr. Laird said it was the proudest evening of his life, and at the same time, one of the saddest; he had tried during the last thirty years to take his share of horticultural work, and in the land he was going to many of his leisure moments would be spent thinking of the many good friends and the associations he had left behind. His earnest hope was that the future held a pleasant reunion in store for them all.

During an interval in the musical programme, the Chairman called upon Mr. William Grant, as one of Mr. Laird's oldest associates, to present him with their gifts. In the course of a felicitous speech, Mr. Grant handed to Mr. Laird a gold watch and chain, and a purse of sovereigns. The watch, which is a valuable hunting-cased English lever, bears his monogram, and the following inscription engraved upon it: To Mr. James W. Laird, from his horticultural friends, as a mark of esteem on his leaving for America, Dundee, March 4th, 1910." Subsequently Mr. David Storrie handed over a gold watch for Mrs. Laird.

On rising, Mr. Laird had a grand reception, and in returning thanks, said the memory of that evening would never fade from his recollection. Their kindness and valuable gifts to himself and his wife would be appreciated and cherished in remembrance of the happy friendship which had always existed between them. After referring to many of the happy incidents which bound them together, his emotions would only allow him to thank them all for practical kindness and expressions of affection.

An interesting programme of vocal and instrumental music was well sustained, and further enhanced by the introduction of a lengthy toast list, when all the speakers took the opportunity offered of expressing their regard for Mr. Laird, and their personal good wishes for a bright and happy future for the family circle.

Mr. J. W. Laird is the second son of the late Mr. R. B. Laird, of Messrs. Downie and Laird, of Edinburgh; Downie, Laird, and Laing, of London; and Laird and Sinclair, Dundee. Mr. James Laird served his apprenticeship in the Edinburgh nurseries of the firm, afterwards going south to Sheffield, where he remained two years in the Handsworth Nurseries of Messrs. Fisher, Son, and Sibray. In 1878 he returned to Dundee, but in 1883 he went to Australia, where he remained for two years, and after returning home he took over the management of Fountainbrae Nurseries, Monifieth, a position he only now relinquishes.

Bristol Gardeners' Association.

A largely-attended meeting was held on March 10, at St. John's Parish Rooms, and presided over by Mr. S. Shaddick.

A lecture upon "Cyclamens" was given by Mr. Cane, who grows these flowers well at Northwoods. Several photographs of plants were handed round, which was a proof of the lecturer's skill in cultivation. Mr. Cane recommended the treatment of cyclamens as annuals, and advised deferring the order for seed until the beginning of October, which, he said, is the best time to sow, thus making sure of new seed. The seed-pans should be placed on a shelf in a house in which a temperature ranging from 60 to 65 deg. is maintained. The seeds should be sown 1¼in. apart, and the seedlings be potted singly when two leaves were formed, and at the end of May be shifted to summer quarters, the best place being a cold frame with a north aspect. A fortnight later they should be placed in their flowering pots (6in.), and shaded from bright sunshine. The lecturer made a special point of placing the corm half an inch below the surface.

The exhibition of cyclamens was quite a feature, especially a bank staged by Mr. Hendy, of Westbury-on-Trym, which won for him a special certificate. For two cyclamens Messrs. Shelton, Hendy, and Curtis were placed as named. Mr. Cane was awarded a certificate for two vases of cut bloom, and Messrs. Curtis and Woodward received two points each, the former for orchids and the latter for violets. The Secretary read a letter from the president, Colonel Carey Batten, inviting the society to view his orchids.

British Gardeners' Association (London Branch).

The monthly meeting of this branch took place at Carr's Restaurant on Thursday, March 10. Two new members were elected, bringing the total membership of the branch up to 183.

The formal business being concluded, Mr. North called attention to a paragraph in the "Kentish Mercury," where it stated that, in answer to a question put by Councillor Mathews at a meeting of the Greenwich Borough Council, it was admitted that an engineer had been appointed to the post of superintendent at Charlton Cemetery. The appointment, Mr. North remarked, was another case of "No gardeners need apply." He also thought it was the duty of the B.G.A. to take the matter up.

The meeting then agreed to send a resolution protesting against the appointment of an engineer to a post that could only be properly filled by a qualified gardener. This protest was sent to the Clerk of the Greenwich Borough Council.

The next business dealt with was the question published in the B.G.A. "Journal"—Assuming that all plants owe their origin to one common ancestral stock, how can we account for two such distinct classes of plants as the monocotyledons and the dicotyledons?

The subject was ably dealt with by Mr. Barnes, who gave an interesting account of the development of these two great classes of plants, tracing their histories from facts deduced by geologists and botanists. He concluded his remarks with a brief reference to the natural causes that have proved such dominant factors in the evolution of plants, such as natural selection and the influence of environment, these resulting in the survival of the fittest.

The Chairman then introduced Mr. Palmer, who gave an excellent paper on "Trees and Shrubs."

The discussion was opened by Mr. North, who dwelt upon the necessity of looking well into the future when selecting trees and shrubs for planting, this being especially necessary in the case of small gardens. He thought better results would be obtained if people would only have patience to wait for the slower-growing evergreens that would furnish the garden all the year through, instead of planting deciduous trees that soon became too large. Mr. Friend, who followed, spoke of the difficulties experienced in inducing any great variety of trees and shrubs to grow in a congested and smoky district like Islington, where even such hardy subjects as privet gradually died out, and had to be replaced every three years.

At the close of the meeting Mr. Winter proposed a vote of thanks to Mr. Palmer for his paper, and complimented him upon the able and exhaustive manner in which he had dealt with his subject. This was seconded by Mr. Barnes, and carried with applause.

Birmingham Gardeners' Association.

"In Nature's Garden" was the subject given recently before a more than ordinary attendance of the members at the Athletic Institute by Mr. Herbert Thompson (an Associate of the Birmingham Naturalists' Society). Mr. T. Humphreys presided. The lecture was illustrated by a large series of excellent lantern slides, and much interest was evoked by the lecturer's account of his natural history camping expeditions with the camera with one or two congenial companions. One of the most impressive all-night outings was on the summit of Snowden to view the glorious sunrise, and, fortunately, their vigils were rewarded with the most sublime scene ever presented to their enchanted gaze.

Graphic descriptions and illustrations of various botanical subjects, such as the reproductive organs of the hazel and willow, orchids, etc., etc., were also portrayed; likewise birds and insects, and numerous other subjects appertaining to Nature's domain, and more or less associated with the vocation of gardening. Altogether this lecture was one of the most enjoyable entertainments of the association.

Reading Gardeners' Association.

The usual fortnightly meeting of the Reading and District Gardeners' Association was held in the Abbey Hall on the evening of March 7. Mr. T. Judd presided, in the unavoidable absence of the President, over a good attendance of members.

The Chairman mentioned that Mr. G. Herridge, a much-respected member of the association had died, and it was resolved to send a letter of condolence to the relatives, and a wreath.

The hall was made most attractive by the lovely display of Giant primulas in variety, backed by myosotis, deutzias, and wistarias, exhibited by Mr. R. Doe, gardener to M. J. Sutton, Esq., J.P., Holme Park, Sonning, and by a superb lot of cinerarias from Mr. F. Townsend, The Gardens, Hillside. Mr. Barnes, Bearwood Gardens, also sent a beautiful collection of hardy-flowering shrubs, consisting of andromeda, berberis, arbutus, Pyrus japonica, pernettya, jasminum, Forsythia, and a collection of hybrid rhododendron, clianthus, and correa cut from the open ground in Cornwall.

The subject for the evening's discussion—"The Hardy Flower Garden"—was introduced by Mr. House, who comes from the kindred association at Bristol, and is held in high esteem by the Reading members. It is needless to say that the subject in the hands of so able a lecturer was thoroughly expounded. Mr. House, in the course of his remarks, explained the meaning of the words "herbaceous," "perennial," "biennial," and "annual," and dealt with the making of borders, time of planting, colour schemes, and combinations, giving also a list of the most suitable plants. He set forth the plants which require to be lifted every year and replanted, and those which should not be disturbed for a number of years, at the same time giving hints on exhibiting perennials. A good discussion took place, and a hearty vote of thanks was accorded to Mr. House, and also to the exhibitors.

Five new members were elected.

Elstree Horticultural Society.

On Tuesday evening, the 8th inst., a large number of members of the Elstree and Boreham Wood Society met in the Church Room, Elstree, to hear a lecture by Mr. F. E. Newman, of Watford, whose subject was "Sweet Peas." The lecturer opened his remarks with an interesting account of the early history of these popular flowers, and then gave details of cultivation, etc. Before concluding, he strongly urged those who had not already done so to become members of the "National Sweet Pea Society," and pointed out the immense amount of information and interest to be derived from membership of that society. A number of questions were put to the lecturer, and ably answered, and a good discussion followed, and Mr. Newman was accorded a most hearty vote of thanks for his instructive remarks.

East Anglian Horticultural Society.

The members turned up in goodly numbers at the March meeting of this society, held in Norwich. Mr. Lewis Smith (Shotesham Park Gardens) presided. A well-written paper by Mr. D. Howlett, Thorpe, upon "The Culture of Soft-wooded Greenhouse Plants," was read, and evoked a fair discussion.

Mr. H. Perry incidentally remarked that that would be the last meeting Mr. W. Palmer, gardener to the late Mr. J. B. Coaks, Norwich, would be amongst them, as he had decided to try his fortune in the fruit districts of British Columbia. Mr. Palmer has been a very active member, and contributed several papers during his engagement at Norwich. Mr. John Clayton and Mr. L. Smith both added words of compliment, and a wish for every success was given by all present.

The exhibition tables were well filled with good examples of fruits, pot plants, and vegetables. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, staged a fine bunch of mixed cut blooms, and a choice odontoglossum. Mr. W. Laws, gardener to G. E. White, Esq., Eaton, again manifested his prowess with winter-flowering carnations, his display coming in for much commendation. Mr. S. Hunt, gardener to Mrs. Willis, Ipswich Road, Norwich, grows the pretty Soldanella alpina in pots, and very effective were the two he brought up to this meeting. Apples and pears comprised the fruit section, and beet and turnips were the chief feature in the vegetable section.

Ruella macrantha.—This is a very useful subject for winter flowering as a pot plant, and also as a cutting flower, standing well when placed in water. The flower heads are terminal, and in colour similar to rehmannia. Good-sized plants may be grown in six-inch pots, and these may have two or three stoppings of the shoots when growing, the number being regulated by the flower heads required. I noticed recently a fine batch of plants grown by Mr. Barks, at Bletchingley.—T. H. Slade.

NEW BOOKS.

FERTILISERS AND MANURES.

By A. D. Hall, M.A., F.R.S. (John Murray, Albemarle Street, W.) Price 5s. net.

Although this work is intended for farmers and senior students in agricultural schools, it will be found equally valuable to horticulturists, not so much for the information it will give them on the use of particular fertilisers for the several crops, as for the clear statement of the principles and practice in manuring. Especially will the book be found useful to those who are desirous of becoming so fully conversant with the principles governing the use of manures that they can readily adapt their practice to the conditions that obtain in widely separate districts. If the book is to have, writes the author, any justification for its existence, it will be by helping men to a greater skill and knowledge in the use of their fertilisers and manures. There is no lack of books which give an account of the origin and composition of fertilisers, but the object of Mr. Hall is to make the reader understand their mode of action, and their relation to particular crops and soils, "for it is only by understanding the why and the how that a farmer can properly adjust his manures to his soil and his style of farming; he must to some extent reason the scheme out for himself; he cannot simply be told." What is true of the farmer, is true also, in some degree, of the gardener, for without considerable thought, it is not possible for him, especially when having to deal with a fresh set of conditions, to use fertilisers to the best advantage.

In the introductory chapter the author deals with the early notices of manures and manuring, the growth of the theory of the nutrition of plants, the investigations of Priestley, Boussingault, Liebig, Lawes, and Gilbert, Hellriegel, and others, the introduction of commercial fertilisers, and the constituents of the soil. The second and third chapters are devoted to fertilisers containing nitrogen. In the fourth and fifth chapters phosphatic manures are fully dealt with; potassic fertilisers occupy the sixth and farmyard manure the seventh. There is no occasion to give a list of the contents of the whole of the chapters, but it must be said that in the thirteen into which the book is divided, the fullest information is given with regard to natural and mineral manures and the principles underlying their use in crop production. We should have liked to direct attention to some of the more important questions discussed by Mr. Hall, but the space available will not permit of this being done. We therefore all the more strongly commend the work to the notice of those of our readers who are desirous of obtaining an insight into the science of manuring. We do this all the more readily because the book is not less interesting than instructive, for Mr. Hall is not only a master of his subject, but is able to present scientific facts in so pleasant a manner as to at once command the attention of the reader, and to sustain his interest until the end.

FRENCH GARDENING.

By Thomas Smith, F.R.H.S. (Utopia Press, Worship Street, Finsbury, E.C.)

This addition to the literature of intensive culture as practised by the market growers around Paris, is based on the work that is being done at the French garden, Mayland, Essex, and well deserves the attention of those who are interested in this aspect of market gardening. The farm of which this garden forms a part is the enterprise of Mr. Joseph Fels, an American gentleman who, during the seven or eight years he has resided in this country, has been engaged in various movements that have for their object the bringing back of the people to the land. One of the movements is, it will be remembered, the utilisation of vacant land within the metropolis in the production of vegetables and flowers by the working classes resident in the several districts. A strong believer in the advantages of small holdings, Mr. Fels purchased a farm of over 500 acres in the parish of Mayland, Essex, for the purpose of converting it into small holdings, in order to show what should be done generally. A small adjoining property of 13 acres has been purchased, and on a part of this area a French garden was instituted, and "the results," we are told, "have been so good that there is every reason to believe it will prove a commercial success as well as an effective object-lesson.

The book is well written, and the directions for the formation and furnishing of gardens intended for intensive culture show a practical acquaintance with the various details, and are free from the exaggerations that have so frequently been associated with reference to market gardening conducted on French lines. In the same way the directions for the production and marketing of the crops are clear and trustworthy. With reference to the all important question of the capital necessary for equipping and working a French market garden of two acres, the author states that a sum of not less than £2,000 is necessary. The cost of equipment will be £1,290, and the working expenses the first eighteen months will be at least £700. The first year's return is estimated at £800, and this amount will be required for carrying on the business for the second year. The gross returns for the second year should, it is suggested, exceed those for the first, and may amount to as much as £1,000. This, according to the figures, would give, after allowing £100 for the wages of working proprietor, a profit of £200, which is by no means excessive, having regard to the amount of capital invested.

BEES FOR PROFIT AND PLEASURE.

By H. Geary (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d. net, by post 1s. 9d.

Honey is such a wholesome and nourishing food that the wonder is more owners of gardens do not keep bees for pleasure and profit. Whether this apathy be due to the dread of bees, or to the want of elementary knowledge of how to manage them, it is difficult to say. Of one thing we are certain; if the would-be beekeeper would only seriously study the excellent practical advice given in the volume under notice, he would soon become fascinated with the hobby, and take it up keenly, with advantage to himself and the community in general.

The volume in question is one of a series of shilling handbooks on rural subjects edited by Mr. T. W. Sanders, F.L.S., and it contains twenty-five chapters full of valuable information on every phase of bee-keeping. The author pleasantly discusses the natural history and habits of bees; the varieties suitable for this climate; the various forms of hives and necessary appliances; the general management of bees, as feeding, swarming, etc.; the extraction of honey, including its various uses; the diseases of bees, and so on; concluding with an excellent calendar of work in the apiary during the year. Illustrations are also freely used in the text, thus adding greatly to the attractiveness as well as usefulness of the book.

Cinerarias as Bedding Plants.—Last year, in a sheltered part of the Bournemouth Public Gardens, some very beautiful plants of cinerarias were grown by Mr. J. B. Stevenson, the able superintendent of the extensive gardens and parks. Being protected by low-growing shrubs from strong winds, the cinerarias were not bruised in the least, and the lovely flowers were seen to great advantage in their setting of healthy leaves. In order to have cinerarias in suitable condition for bedding out as here described, seeds must be sown in September, the resultant plants being kept through the winter, and put out in the beds the following June.—Geo. Garner.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

NEW SWEET PEAS.—N. B., Derby: Soak the seeds in tepid water for twenty-four hours, and then sow them singly in three-inch pots, and place in a warm greenhouse. As soon as the growth bursts through the soil, transfer the batch to a cold frame, keeping the lights on for a day or two, and at night, unless the weather is specially favourable. The amount of ventilation allowed should be soon increased, until just before planting time the lights are left off altogether.

REX BEGONIAS.—L. D. G., Nottingham: The variegated-leaved or Rex begonias are easily propagated; indeed, few plants are more readily multiplied. If a leaf has been injured in any way, remove it from the plant, and lay it back downwards, on sandy soil in a pan or box, first cutting through all the prominent veins and ribs with a sharp knife at intervals of about an inch. When laid on the soil a few pebbles should be used to keep the leaf in position. Kept moist in a warm house, buds will soon form at the cut portions, and presently develop into little plantlets that should, in due course, be removed and potted separately.

SPROUTING SEED POTATOES.—S.C.M., Littlehampton: We have repeatedly drawn attention to the advantages to be obtained from sprouting seed potatoes, and we strongly advise you to at once place the seed tubers with their thick ends uppermost in boxes, and stand them in a light position, such as a cold frame, or shelf in a cold greenhouse, or a light shed. Here the growths will come stout and strong instead of thin and weakly, and you should rub off all but the two or three best shoots before planting time. All shoots produced from other eyes than those at the top of the tuber should be rubbed off as soon as formed.

WOOD ASHES FOR SWEET PEAS.—O. B., Bedford: As wood ashes are very rich in potash, and sweet peas are benefited by potash in the soil, you will be quite right in dressing the flat freely with the ashes. Fork them lightly into the soil at once, and, when you take out the shallow trenches for the sweet peas, dust two ounces of superphosphate into each eight or nine feet run of trench.

TOMATO SEEDS.—E. T. B., Sevenoaks: Sow the seeds at once in sandy soil in a box or pan, and place in the warmest corner of your house. Cover the pan with a sheet of glass until the seeds germinate, then remove it. If you take a little pains and sow the seeds an inch apart, there will be no danger of producing weak, spindly seedlings, but the youngsters will be sturdy and grow away steadily, as they are potted into three-inch, and subsequently into five-inch pots. When established in the three-inch pots, let the plants have all the light obtainable, and more air than previously.

FORCED DAFFODILS.—T. L. R., Basingstoke: When the flowers have faded or have been cut for use, put the pots or boxes of plants in a frame, water them as necessary, and give air on all favourable occasions. Ventilation may soon be increased, and before long the stock may be stood out under a sheltering hedge or wall. Still water them as they need it, or, if the opportunity serves, plant them out in borders or shrubberies, or other places, where they will soon ripen their leaves and die down. Next spring plants so treated will bloom, and in the following year they will give flowers of good quality. It is certainly well worth while taking a little care of the best of the late-forced daffodils.

WIREWORMS.—M. E. J., Winchester: The fact that there are several kinds of wireworms is by no means generally understood. Further, the grubs of the crane fly are sometimes confused with wireworms, as also are the millepedes. A true wireworm has six tiny legs towards the fore-part of its body, and a sucker-foot at the tail end. The crane-fly grubs have no true legs, while the millepedes have very many. There are at least four kinds of wireworms hurtful to garden and farm crops, and probably the one that is the most harmful is the grub of Elater (or Agriotes) lineatus. Wireworms are the grubs of Click Beetles, and in the wireworm stage they remain for four or five years in the soil, chiefly feeding on roots near the surface. In winter time they go deeper down into the soil, as the frost increases in severity, but come up again in the spring time, and it is during spring and early summer that they may be best trapped by means of hollowed halves of potatoes, and pieces of carrot or turnip, placed a little below the surface of the soil in gardens where their presence is all to well known. Both salt and gas-lime used at the rate of about 8lbs. per rod and dug into infested plots in autumn, have proved very successful in dealing with wireworms.

SOWING GORSE FOR COVER.—W. T. J., St. Mellion: Gorse is best sown in the autumn, as soon as the seeds are ripe, and they will then germinate readily the following spring. Draw the drills a yard apart, and sow the seeds at the rate of about half a pound to every 100 feet run of drill. You would probably find it a better and cheaper plan to sow the seeds in drills a foot apart, in a prepared seed bed, and transplant the seedlings when large enough to the site they are to occupy, planting them about a yard apart every way, or closer if it appears necessary to cover the ground more quickly. When established, gorse should be cut over rather severely every third year to keep it dense.

SCALE ON PEAR TREES.—F. S., Mynach: It is too late to properly deal with the scale on pear trees this season, but next winter the trees should be loosed from the wall and both wall and branches should be sprayed with a caustic soda and potash mixture. At present your best plan is to soften the scales by syringing the trees with warm soapy water, following this by scraping the stems and branches with a blunt knife, using only sufficient force to remove the pests. When all that is possible has been done in this direction, paint all the branches with a mixture made up of two pounds of soft soap, 1lb. of flowers of sulphur, and 14 gallons of water. Dissolve the soap in just sufficient boiling water, and gradually stir in the sulphur, then add sufficient water to make up about 14 gallons. You can, of course, make a smaller or a larger quantity of mixture, providing the constituents are used in the same proportions as above.

SEEDLING SNOWDROPS.—T. J. N., Aylesford: The flowers did not show any improvement upon, or distinction from those of the ordinary type of snowdrop, but as they were faded badly on receipt it is possible they showed some distinct colour variation when fresh. If you will let us know whether this is so or not, we will advise you in the matter.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION" by J. B. Wroe. Sixth Edition, revised to January, 1909, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

OBITUARY.

◆

MR. DREWETT O. DREWETT.

It is with sincere regret we have to record the death of Mr. Drewett O. Drewett at his residence, Willow Wood, Riding Mill, Northumberland, on Wednesday, March 9th, in his 72nd year. The deceased gentleman was preparing to call on some friends, when he suddenly collapsed and died almost immediately, in his dressing-room. By the death of Mr. Drewett the North of England has lost one of its leading garden lovers, and a most generous supporter of horticulture. On p. 374 of our issue of May 15 last year we gave particulars of Mr. Drewett's gardens, and of his enthusiasm for orchids, in the cultivation and hybridisation of which he had been keenly interested during the past quarter of a century. Ever of a kindly disposition, his hospitality was always extended to those who visited his gardens. He was an annual subscriber, indirectly, to the Gardeners' Royal Benevolent Institution, and he gave every encouragement to the horticultural and mutual improvement societies in the district. The funeral took place on Monday last at Salehurst, Robertsbridge, Sussex.

We extend our sincere sympathy to Mrs. Drewett in her sad bereavement.

MR. McDONALD.

A sad fatality occurred at Braemar, Aberdeenshire, on Tuesday afternoon last. Mr. McDonald, a local florist and jobbing gardener, of Fern Cottage, Braemar, had occasion to go through a field leading from the public road. A stream runs through the field, and it is supposed that the unfortunate man tried to leap across, missed his footing, and fell, striking his forehead against a stone, which stunned him. The stream, or ditch, contained only a few inches of water, but before he was discovered life was extinct. Mr. McDonald, who was sixty-five years of age, served his apprenticeship as a gardener at Traquhair House, near Peebles, afterwards returning to his native parish, where he did a good local business. Quite a gloom has been cast over the district at Mr. McDonald's untimely end, as he was well known and highly respected. Deceased is survived by a son and two daughters, to whom the deepest sympathy is evinced.

FORTHCOMING ENGAGEMENTS.

TUESDAY, March 22.—Royal Horticultural Society; Narcissus Committee at 11.30; Fruit, Floral, and Orchid Committees at 12 o'clock; Masters' Lecture at 3 p.m. on "The Adaption of the Plant to the Soil," by Mr. A. D. Hall, M.A., F.R.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, March 23.—Stour Valley Gardeners' Society's Exhibition of Vegetables at the Royal Horticultural Hall.

Great Jubilee Bulb Exhibition at Haarlem, to be opened by Prince Henry of the Netherlands; continues to March 31.

FRIDAY, March 25.—Good Friday.

MONDAY, March 28.—Easter Monday.

WEDNESDAY, March 30.—Royal Society of Arts Meeting.

TUESDAY, April 5.—Royal Horticultural Society: Narcissus and Tulip Committee at 11.30; Fruit, Floral, and Orchid Committees at 12 o'clock; Lecture at 3 p.m. by Rev. Prof. G. Henslow, V.M.H., on "The Use of the Spectroscope in the Study of Plant Life"; Scientific Committee at 4 o'clock.

Scottish Horticultural Association.

Bournemouth Spring Show: Two days.

The best remedy
for mildew, greenfly, and all forms of insect blight is a solution of . . .

Cyllin Soft Soap destroys greenfly and other aphides, red spider, rose hopper, gooseberry caterpillar, black currant mite, American blight, mildew, etc., etc.

Cyllin Soft Soap

As used at the Kew Royal Botanic Gardens.

The wash should be made in the following manner:—Dissolve one part of Cyllin Soft Soap in two parts of hot water. Of the resultant liquid three ounces (one teacupful) should be mixed with one gallon of cold water and used with any approved syringe or sprayer, such as Jeyes' Horticultural Sprayer. (Particulars of this Sprayer on application.)

N.B.—For use in gooseberry mildew and American blight it is desirable to add a teaspoonful of pure Cyllin (Jeyes' Special Fluid) to each gallon of the solution.

Pamphlet and Price List on application to—

7 lb. tin ... 3/-

When diluted as instructed,
ONE GALLON
COSTS ABOUT A FARTHING.

TRADE NOTES.

From Messrs. William Bull and Sons, King's Road, Chelsea, we have received a box of blooms of their specialities in Chinese primulas. All the varieties represented are excellent, but the white Snowdon, the bright Salmon Queen, and the deep-red Duke of York were especially noteworthy.

Messrs. Mackenzie and Moncur, Lim., of Edinburgh and London, inform us that they have appointed Mr. W. E. Turnbull to succeed the late Mr. D. McCorquodale in the management of their business as carried on from 8, Camden Road, London, N.W. Mr. Turnbull has had over twenty-five years' experience, and clients can therefore feel assured that the care and attention devoted in the past to enquiries and the execution of orders will be continued in the future.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Swanage Horticultural Society: August 1.
Leicester Flower Show: August 2 and 3.
Northampton Flower Show: August 3 and 4.
Sevenoaks Horticultural Society: August 9 and 10.
Teddington and Hampton Wick Horticultural Society: July 13.
Leamington Horticultural Society: July 27 and 28.
Haywards Heath Horticultural Society: July 20.
Croydon Chrysanthemum Society: October 26 and 27.
Hawick Diamond Jubilee Show: August 27.
Hawick Chrysanthemum Show: November 25 and 26.

Jasminum primulinum. — This very fine yellow jasmine, while scarcely hardy, except in sheltered positions, is well worthy of a position in a cool house, where it can be trained near the roof glass, or where it can have free exposure to the light. On a sheltered wall outside, it is an attractive object when in flower, but to convey a proper effect of its beauty one must see it growing under cover. Flowers produced outside have no comparison in size and purity of colour with the blooms grown under glass. Those in search of a winter-flowering plant with yellow flowers, will find this worth their consideration.—T. H. Slade.

Omphalodes verna.—One of the loveliest of our perennial spring flowers is Omphalodes verna, a plant worthy of its time-honoured place, if only for the bright, refreshing blue of its flowers. Unlike a large number of the orthodox spring flowers, this subject requires very little attention, as it grows freely in any ordinary soil, and succeeds to perfection under the light shade of deciduous trees. Omphalodes verna early responds to the awakening influence of spring, the first flowers being generally in evidence early in March. The general character of these are very suggestive of the forget-me-nots, but in other respects the plant is quite distinct. The flowers are on six-inch pedicels, and are only few-flowered, while the colour is a very fine blue with a conspicuous white line marking the throat. The radical leaves are oval-heart shaped, passing into a more lanceolate form as they ascend the stem, the stems are prostrate, and the plant increases in much the same way as the garden strawberry. There is also a white-flowered form of Omphalodes verna, but it is singularly lacking in the beauty which endears the type to flower-lovers. Both are good growers, and most reliable for carpeting rough ground. The foliage alone is decorative, even when the flowers are gone. They also succeed in such charming company as the Tiarella cordifolia (Foam Flower), and Gentiana asclepiadea (Willow Gentian). — Thomas Smith.

CATALOGUES RECEIVED.

BEES, LIM., MILL STREET, LIVERPOOL.—A select list of alpine and herbaceous plants.

RANSOMES, SIMS, AND JEFFERIES, ORWELL WORKS, IPSWICH.—A neat little pocket list of this firm's specialities in lawn mowers for various purposes, and in various sizes, edge cutters, lawn sweeping machines, etc.

CHILVERS AND SON, HUNSTANTON.—An interesting, handy, and illustrated catalogue of conifers, evergreen, and flowering trees and shrubs.

WM. ARTINDALE AND SON, NETHERGREEN, SHEFFIELD.—A useful descriptive catalogue of plants, including florists' flowers.

KELWAY AND SON, LANGPORT.—Under the title of "Kelway's Manual for 1910-11," this firm has issued one of the most interesting and beautiful of catalogues we have ever seen. It is a quarto volume of 342 pages, and its sections are devoted to perennials, seeds, and bulbs. The illustrations are numerous and good, and the ten coloured plates add to the many attractions of a quite unique and most useful production.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

NOW IS THE TIME TO PLANT
KELWAY'S PYRETHRUMS; their celebrated free flowering, brilliant, large-flowered, elegant, long-stemmed kinds; invaluable in the Hardy Border, and for the Cut Flower Garden. The "Spring Chrysanthemum" or "Coloured Marguerite."
Collection B, 12/- per dozen, improved "Kelway" varieties.
,, C, 21/- per dozen, extra fine.
Carriage paid for remittance with order.
KELWAY and SON, The Royal Horticulturists,
Langport, Somerset.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists,
Langport.

NOW IS THE TIME TO PLANT Kelway's beautiful Blue Delphiniums, in borders and beds; as clumps on the lawn, and at the sides of carriage drives. There is no hardy flower more stately and of lovelier shades of BLUE—that precious colour in the garden.

We recommend the following named collections:—
Collection B, 15s. a dozen; 100 for £5 10s.
Collection D, 34s. a dozen; 3s. each plant.
KELWAY and SON, Langport, Somerset.

BLACKMORE AND LANGDON,
Twerton Hill Nursery, Bath.

TANKS, CISTERNS, FOR GARDENS AND FARMS, water barrows, and garden implements, etc. Send for Illustrated Catalogue, free. BOULTON and PAUL, LTD., Manufacturers, Norwich.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

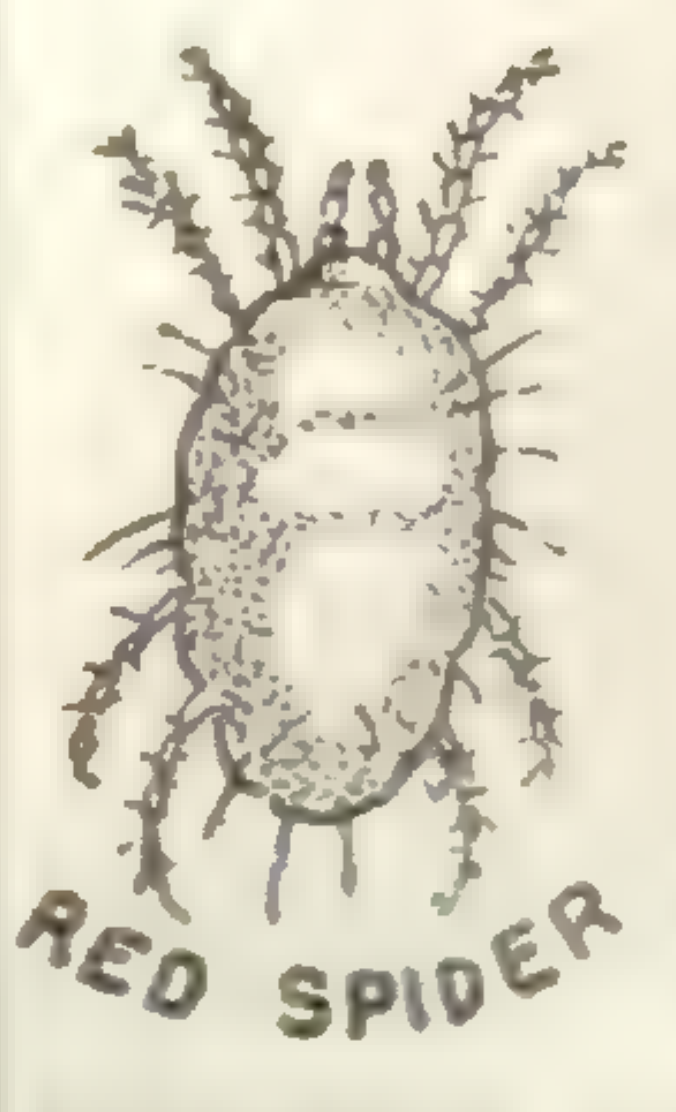
THE RED SPIDER.
(Tetranychus Velarius).



In hot, dry seasons the Red Spider works much mischief on fruit trees, more particularly the plum.

CLIFTS INSECTICIDE

kills this insect and all other pests. Sample and instructive booklet for 3d. in stamps.

ROBINSON BROTHERS, LD., West Bromwich.

A Spray of Single-Flowered Pyrethrum.

PURPLE AND FINE GOLD.

Rich, warm hues in splendid variety, these are the features of

KELWAY'S HARDY PYRETHRUMS.

Easily grown in any ordinary soil, they flower early, blooming in royal magnificence throughout the summer, and in the autumn flowering a second time. They are invaluable as cut flowers.

Now is the time to plant the fine and hardy

KELWAY PYRETHRUMS.

The following are choice collections of named Pyrethrums, double or single flowered, or both.

Collection B.—1s. per plant, 100 for 84s.
Collection C.—2s. per plant, 21s. per doz., 84s. for 50.

KELWAY & SON,
THE ROYAL HORTICULTURISTS,
LANGPORT, SOMERSET.

SPECIAL REDUCTIONS IN PRICE OF RHODODENDRONS, etc.

We hold the largest Stock of **RHODODENDRONS** in Great Britain, all extra fine, bushy stuff, grown 1,000ft. above sea-level; being recently transplanted are in a splendid condition for removal. Special reduction will be made to clear land of the following:—

RHODODENDRONS, which can be supplied by the hundreds of thousands, in sizes from 1ft., 1½-2ft., 2-2½ft., 2½-3ft., and 3 to 4ft., by the doz., 100, or 1,000 to suit purchasers. **PONTICUMS, HYBRID SEEDLINGS, BLANDUM, CAUCASIAN PICTUM, CUNNS** (white and blush), **JACKSONII,** choice named varieties; extra fine, clean stuff.

AZALEA PONTICUM, 1 to 4 ft., extra fine.

CUPRESSUS, in all varieties, from 2 to 6 ft.

HOLLY COM., from 1, 2, 5, 6, 7, 8, and 9 ft. high; extra fine. **HOLLY HODGENSI, MADERIENSIS,** and **SHEPHERDI,** in all sizes.

LAURELS in variety, from 2, 3, 4, 5, 6 ft. high.
YEWS, ENG., from 1, 2, 3, 4, 6, 7, and 8 ft. high; extra fine stuff.

ORNAMENTAL TREES, FOREST TREES, PLANTS FOR HEDGES, GAME COVERTS, ETC., in large quantities.

We extend a Courteous Invitation to Inspect our Nurseries, 300 acres in extent.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Horticultural Lectures.

MR. E. J. ALLARD.

With the opening days of spring the winter session of the numerous gardeners' associations will have drawn to a close, and the committees will, if they are wise, be giving attention to the preparation of the programme of the meetings that will be commenced shortly after the cessation of the summer's activities. Hence some reference at the present time to this important matter can hardly fail to prove useful, especially to those who are desirous of avoiding a slavish adherence to traditional methods of procedure. In many instances the consideration of the programme is deferred until within a comparatively short period of the inaugural meeting of the session, but there are several objections to such delay. In the first, the members of the executive will not have six months afterwards so clearly in their mind the weak and strong features of the session as at its close, and therefore will not be in a position to so fully appreciate the desirability of making such changes in methods of procedure as are essential to the maintenance of the meetings at a high level. By commencing the preparatory work now there will be less difficulty in obtaining papers and lectures from horticulturists living at some distance beyond the sphere of the society's operations. As regards readers of papers resident in the district, the additional time will be a distinct advantage, as it will give them fuller opportunities for thinking out the details of their subjects previous to committing their thoughts to paper. There is the further advantage in commencing early, of being able to bring the programme before those who are interested in gardening well in advance of the opening meetings. Whether the programme should be wholly filled by members, or include several lectures given by prominent horticulturists, is a question that must be determined by the circumstances of each case. There are not wanting those who believe that the first of the two methods is preferable. From long experience of the work of gardeners' societies we are fully persuaded that the best course is to include in the programme of each session the names of a few prominent horticulturists who reside outside the district. They may not be more successful cultivators or better speakers than some who reside within the district, but the occasional visit of a stranger quickens the interest in the meetings, and he will, more often than not, state his views upon some particular subject in a quite different manner than that to which the members have become accustomed. If the societies are to fully accomplish the work of which they are capable, the adoption of the second of the two courses of procedure is imperative. The time has gone by when the whole of the meetings should be given up to the discussion of subjects of a severely practical character. Science, as well as practice, should have full recognition, and in each session about one-third of the papers and lectures should be on scientific matters having a direct bearing on horticulture, and these should be by recognised authorities on the respective subjects. The formation, composition, and amelioration of soils, the science of manuring, plant growth, hybridisation and cross-fertilisation, fungoid diseases and insects injurious to plant life, are subjects of much importance to those engaged in garden management, and if dealt with by those fully conversant with them will be of intense interest. The great industries that appeal to gardeners, such as the daffodil industry, the tomato industry, and the grape industry should also receive attention, and if they are dealt with by those who are well acquainted with what is in progress, both at home and abroad, the meetings will be profitable as well as interesting. At least two evenings of the session should be set apart for an account of the chief gardens in the district, or of great gardens in other parts of the United Kingdom, including, if so desired, the botanical establishments. Not so long since the Croydon Gardeners' Society devoted an evening to an illustrated lecture on the gardens of which Croydon is the centre, and it was regarded as one of the most successful of the many admirable meetings which this enterprising society has held. Before societies can carry out programmes of so comprehensive a character as here suggested it will be necessary for them to have greater financial strength than is usually considered sufficient. They should certainly follow the example of the Croydon Society, and provide themselves with a good projection lantern, as slides are a necessity for many of the subjects mentioned. They will be found useful for many others, and, if some discretion is exercised, they will add much to the interest of the meetings. The lantern should be a good one, and adapted to the place of meeting and the method of illumination available, but the cost of purchase will not be so large that the amount cannot be raised without special difficulty, provided the necessary enterprise is forthcoming. It was found at Croydon, as will be found elsewhere, that the owners of gardens readily contribute to the fund raised for the purchase of the lantern. Illustrated lectures invariably prove the most attractive, especially when the members include a considerable proportion of amateurs, but it should be distinctly understood that the slides should be used to elucidate the remarks of the lecturer rather than to hide any defect he may possess as a speaker. The financial aspect of the work is not disposed of by the purchase of a lantern. The payment of lecturers on special subjects will have to be considered, and, with reference thereto, we would point out that it is unreasonable to ask someone who has obtained a prominent position in the world of horticulture to lecture without fee, and, more often than not, to allow him to be out of pocket to the extent of his travelling expenses. It is, of course, a different matter in the case of members, and of those resident in the same district, as they may be assumed to be sufficiently interested in the success of the society to be willing to render it assistance. Demonstrations of horticultural practice and of floral decorations should have a more prominent position in programmes than is usually assigned them, for they are especially useful to young gardeners, and of interest to those who are no longer young.

Mr. E. J. Allard, whose name is familiar to our readers by reason of his writings and the many reproductions from his plant portraits that have appeared in these pages has, as we have already announced, just taken up the very important post of garden superintendent at the John Innes Horticultural Institute, at Merton, of which Mr. Bateson is the director. Mr. Allard commenced his gardening career in a private establishment, where he had a good grounding in the general routine of garden practice. He then spent a few months in a nursery, and eventually entered service as an improver at the Cambridge Botanic Gardens, under Mr. R. Irwin Lynch, M.A., where he added greatly to his experience and knowledge of plants. From Cambridge Mr. Allard went to Kew, where the large plant collections, library, practical work, and courses of lectures further enabled him to add to his knowledge and widen his experience. From Kew Mr. Allard returned to Cambridge Botanic Gardens, where for five and a-half years he was foreman of the indoor department, this period being followed by one of five years as foreman of the outdoor department of the same establishment. Mr. Allard has had a good deal to do with the experimental work carried on at Cambridge, and took an active part in the work of plant breeding there, and doubtless this experience will also be of great value to him in his new duties. What force the John Innes Horticultural Institute is to exert upon the horticultural world depends largely upon the lines of development Mr. Bateson lays down; he has certainly an able lieutenant in Mr. Allard, who has our heartiest wishes for a successful career.

Haarlem Jubilee Flower Show.—The first of the series of horticultural exhibitions arranged by the General Bulb Growers' Society of Haarlem for the celebration of its jubilee was opened on Wednesday, March 23, under the most favourable auspices. The exhibition is being held in Hertekamp Park, one of the public parks belonging to the city, and a more delightful place for the holding of flower shows it would be difficult to imagine. It is extensive, finely wooded, and convenient of access, and the greater part of its area has been converted into a veritable flower garden that will be rich in attractions during the next two months. Just now it is gay with crocuses, and these will be followed by daffodils and hyacinths in variety, and a wide range of tulips in which early, mid-season, and May-flowering varieties are fully represented. The contributions to the first of the temporary shows are arranged in four spacious structures that are equally remarkable for elegance of design and suitability for the purpose for which they have been erected, the lighting being particularly good. Within the several exhibition houses there is an exceptionally fine display, hyacinths, tulips, mollis azaleas, rhododendrons, and lilacs being especially noteworthy. British horticulturists are in strong force, and among those who answered to their names when the jury was called on Tuesday morning last were: Mr. J. F. McHattie, of Edinburgh; Mr. G. Cuthbert, of Southgate; Mr. Walter Ware, Bath; Mr. C. E. Pearson and Mr. Duncan Pearson, of Lowdham; and Mr. George Gordon, Kew.

The Crush at the Horticultural Hall.—In order to avoid a repetition of the crush that occurred on the occasion of the R.H.S. meeting of March 8, direction posts were set up in the hall on Tuesday last, indicating the route visitors should follow, and, in addition, every visitor was handed the following notice: For your own comfort as well as for that of others, you are entreated to turn to the right immediately on entering the hall and keep stedfastly to the right, thus making the entire circuit of the hall, along the walls, first; and then proceeding to the central tables, still keep up and down to the right.

Vandalism at Camberwell.—The fact that a fine chestnut tree has been cut down in Camberwell Grove, for no apparent reason than the provision of work for the unemployed, and that the plane trees in Grove Park have been hideously lopped, though still young, is causing a great deal of anxiety on the part of tree lovers, for these things appear to have been done under the direction of the Borough Council, and not under the advice or guidance of anyone with a knowledge of arboriculture.

Herbert Park, Dublin.—A premium having been offered for the best design for the laying out of Herbert Park, Dublin, the site of the recent International Exhibition, a large number of designs were submitted, and that of Messrs. J. Cheal and Sons, landscape gardeners, Crawley and London, has been accepted, and the premium awarded accordingly.

Rothamsted Report for 1909.—The annual report for 1909, from the Rothamsted Experimental Station, Harpenden, with the Supplement to the Guide to the Experimental Plots has reached us, and shows that the staff under the direction of Mr. A. D. Hall, M.A., F.R.S., has been exceedingly active during the past year in the investigations of matters of great interest to agriculturists and also to horticulturists. Special subjects investigated and briefly referred to in the report are "The Effect of Partial Sterilisation of Soil on the Production of Plant Food," "Direct Assimilation of Ammonia Salts by Plants," "The Development of the Grain of Wheat," "The Amount of Free Lime and the Composition of the Soluble Phosphates in Basic Slag," and "Estimation of Calcium Carbonate in Soils." In connection with partial sterilisation, it is stated that the heating or treatment of soil with antiseptics kills off the protozoa and amœba which live on soil bacteria, and thus keep down their numbers, but it leaves unhurt some of the spores of the ammonia-producing bacteria which afterwards can develop to a much greater extent because freed from this normal check. Soil partially sterilised by being heated to 100 degrees for two hours is said to give a marked increase of crop.

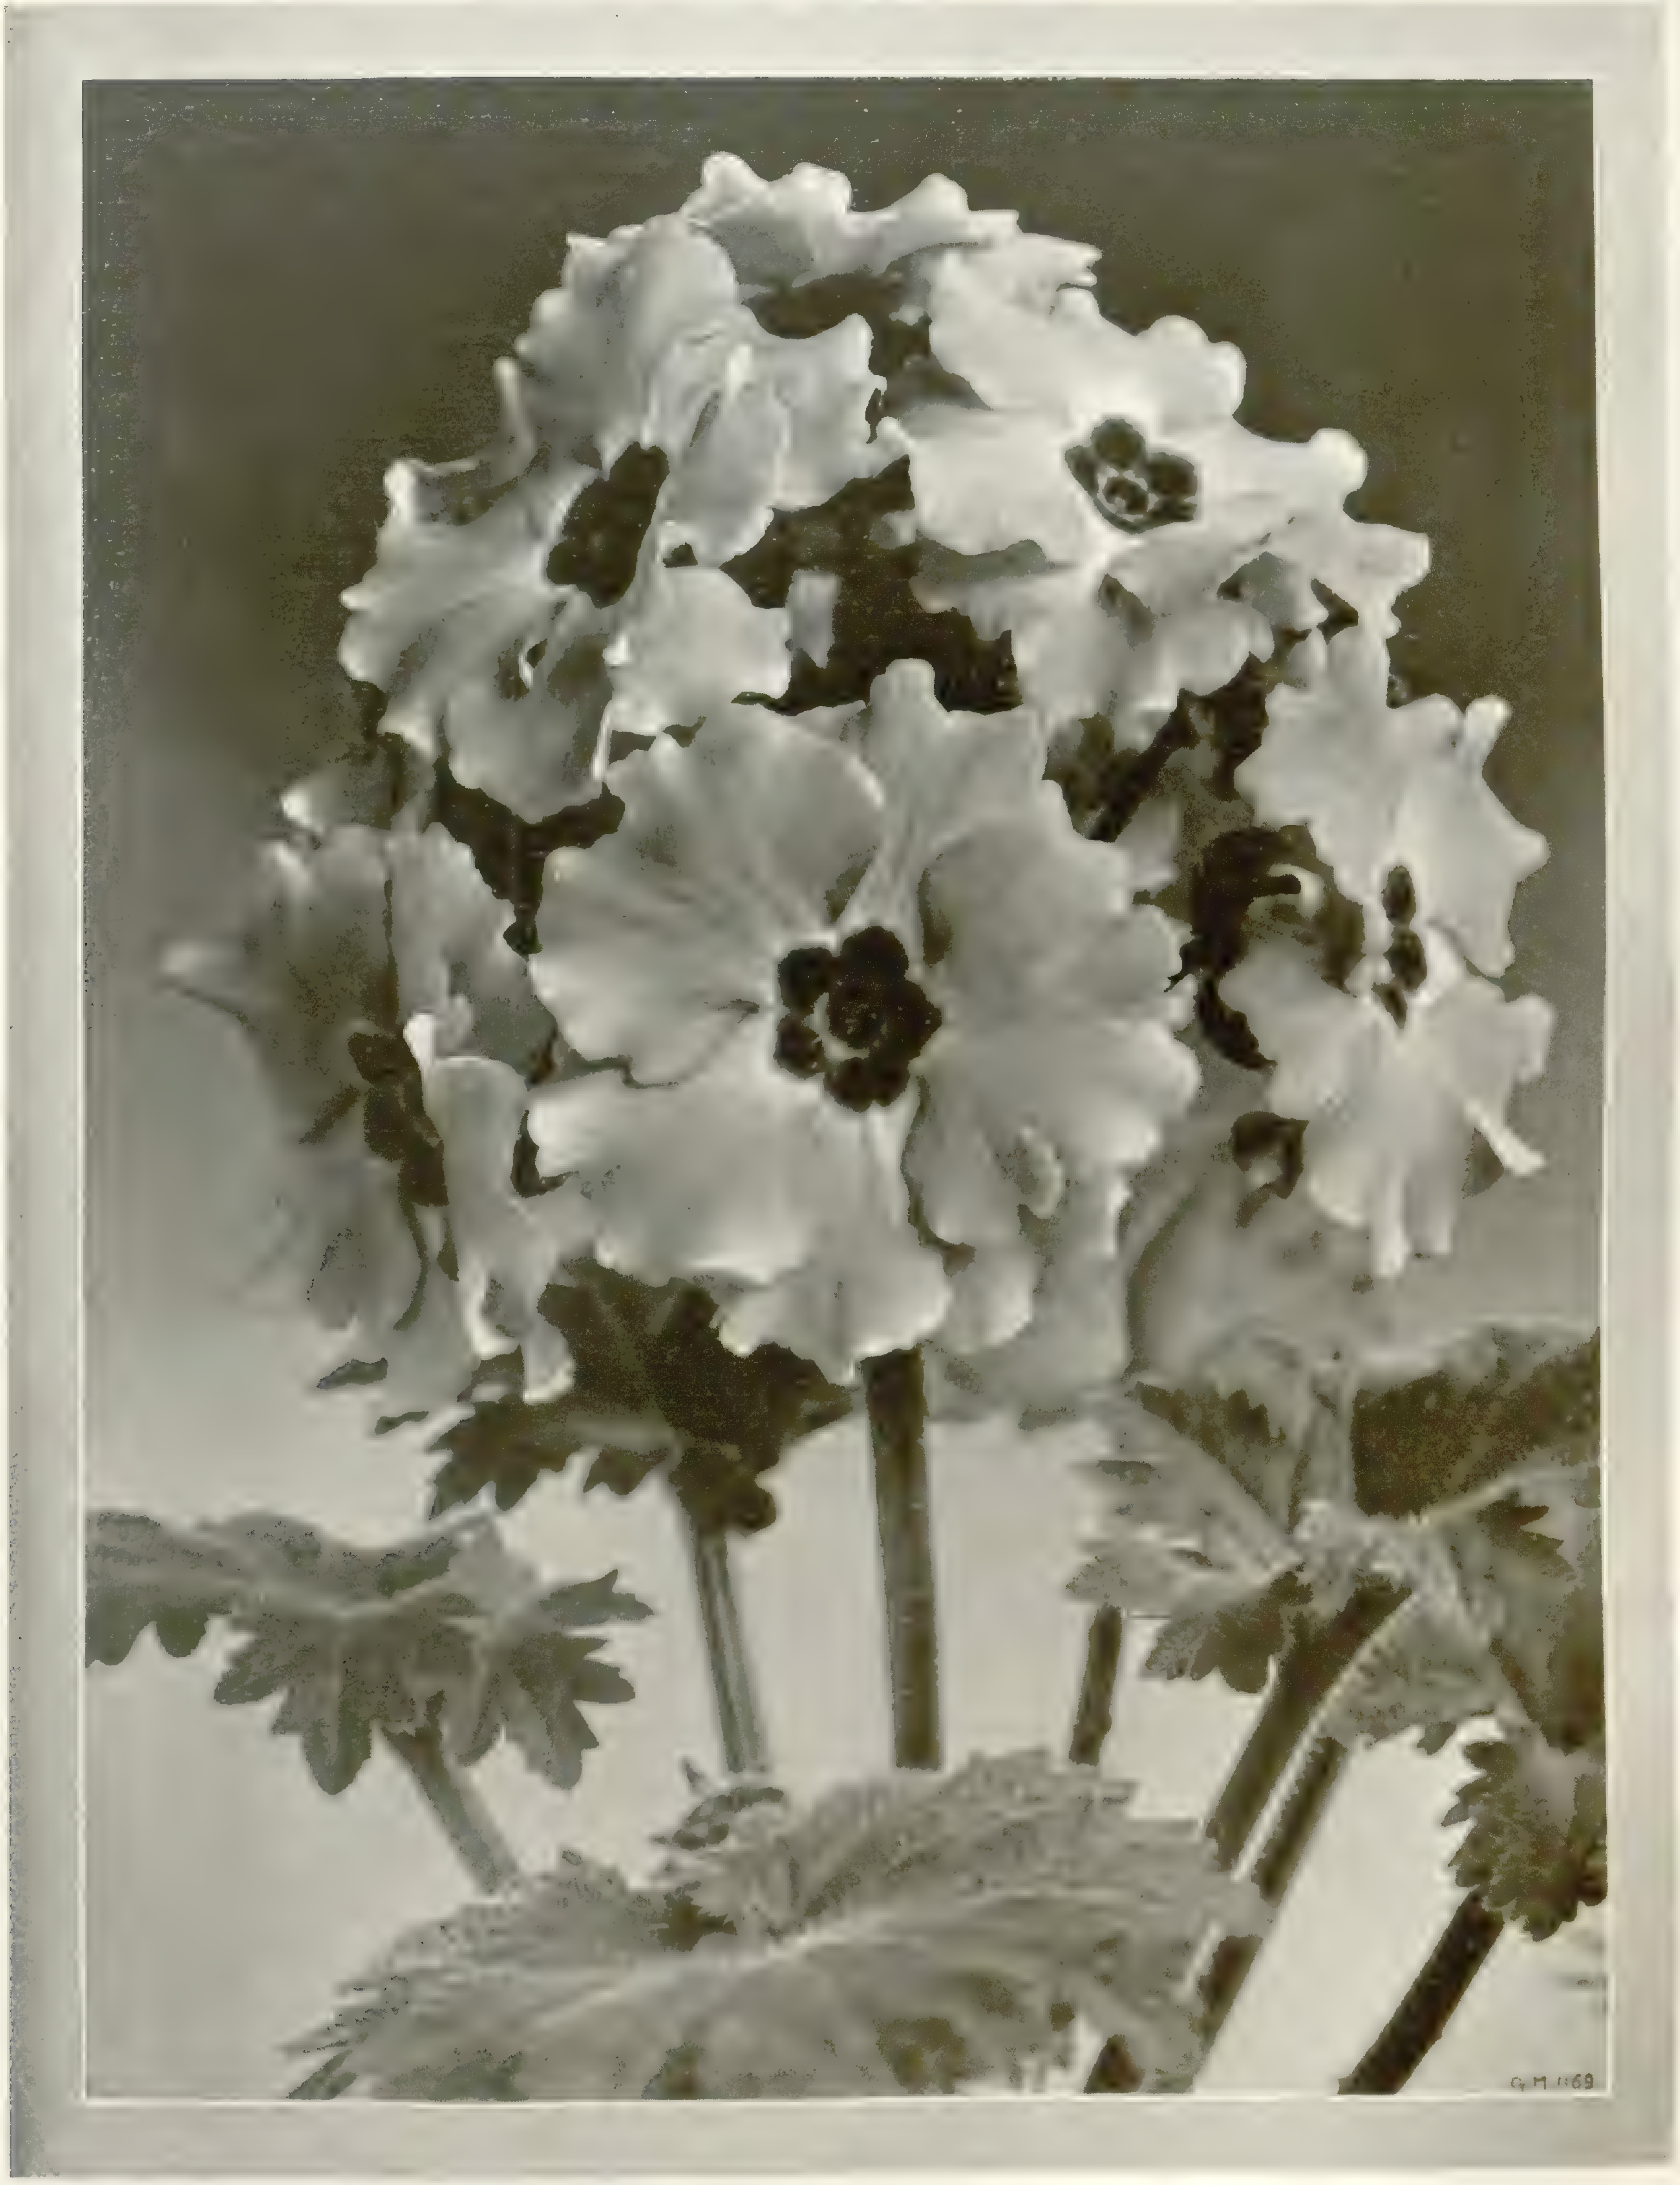
Proposed Gardeners' Congress.—Mr. J. Weathers writes: "It has been suggested that the time has arrived when the gardeners of the United Kingdom should meet together to discuss matters affecting their interests and profession. The chief difficulty in the way of this is to select a day and a time that would be convenient to any very large number, but probably the first day of the Holland House Show at Kensington—that is, on Tuesday, July 5 next—would be as good a day as any to secure a meeting of representative gardeners from various parts of the kingdom. Gardeners generally are beginning to feel that unless they co-operate in some way, the best positions in their calling are likely to be filled by men who have had no horticultural practice or experience. If gardeners in sympathy with the idea of holding a conference will kindly send their name and address to me at Talbot Villa, Isleworth, I think I may say that the Executive Council of the British Gardeners' Asociation will be only too pleased to co-operate and to defray the expenses."

Royal Botanic Society.—At a meeting of this society, held on Saturday, March 19, Mr. Pembroke S. Stephens, K.C., presided. Fifty-four new Fellows were elected and sixty-one nominated for ballot at the next meeting. Since the beginning of the year 181 new Fellows have been elected and proposed, this constituting a "record" for the society.

The Elm Avenue at Battersea Park.—Mr. V. Cockram, secretary of the London Branch of the B.G.A., writes that the central elm avenue at Battersea Park is being destroyed by a disease more deadly than the woodman's axe, and one which is beyond the power of man to prevent or cure. The trees have fallen a prey to the attacks of such parasitical fungi as Polyporus Ulmadia and P. sulphureus. These parasites have found a lodgment in the bark and the fungus has eaten its way through the fibres of the branches, and so weakened them that they are apt to fall without warning, especially when the leaves are heavily laden with rain. It will thus be seen that the trees have become a source of danger to the public, and it is only necessary to recall the fatal accidents which occurred in Kensington Gardens some time ago to realise how serious the danger really is. It is on this account that the authorities have reluctantly had to condemn the beautiful elm avenue in Battersea Park and have the diseased and dangerous branches removed.

Crocuses at Uttoxeter.—From Mr. J. Marston, gardener to H. Ford, Esq., The Hall, Uttoxeter, we have received two photographs of the crocuses in flower under a fine old beech tree in The Hall gardens. The photographs are not suitable for reproduction, but they indicate what must be a delightful scene at this season of the year, and are something like that to be seen at Kew or in Regent's Park.

Rehmannia Briscoei. At the recent meeting of the R.H.S. Scientific Committee, Mr. Harry J. Veitch showed a hybrid between Rehmannia angulata (of commerce) and R. Henryi. The hybrid had been raised by Mr. T. W. Briscoe, after whom it was named. The parents were also shown, for comparison. The hybrid was in most characters intermediate between its parents, being dwarfer than angulata and having an erect inflorescence instead of a condensed one, as in the pollen parent. The flowers were intermediate in colour and of a soft, pleasing pink. The leaves were arranged in a rosette, and were similar in shape to those of R. Henryi and had the same dark veinings, while they were much more velvety-hairy than those of R. angulata, though a little less so than those of R. Henryi. A Botanical Certificate was unanimously recommended for Rehmannia Henryi, now for the first time exhibited and a Certificate of Appreciation was unanimously recommended to Messrs. J. Veitch and Sons for work in connection with the raising of this interesting hybrid.



PRIMULA PRINCESS MAY.

A fine giant-flowered blush variety raised by Messrs. James Carter and Co. (See next page.)

THE HOLBORN PRIMULAS.

In 1837 James Carter, the founder of the firm of Messrs. James Carter and Co., of Holborn, offered six varieties of sweet peas, but in the absence of the original catalogue one may reasonably suppose there was no offer of Chinese primula seed at that date, for Primula sinensis was only introduced in 1820. However, it is interesting to notice that Chinese primulas attracted the close attention of the florists long before the sweet pea did, although the latter was introduced many years previously. The reason for this is to be found, probably, in the fact that the Chinese primula soon came to be prized as a winter-flowering plant, and this, in the days when retarding and forcing were not conducted as now.

Whether the Chinese primula will always fill the large place it has occupied during the last five-and-twenty years is purely a matter of conjecture, but there are at present no signs of any diminution of its popularity in private gardens, though in recent years somewhat fewer plants are grown for market. There is a sturdiness, symmetry, and beauty, and yet no lack of elegance, about a finely developed plant of a fine primula that appeals to most lovers of flowers, and many gardeners, amateur and professional, would feel that the circle of the horticultural year had been hopelessly broken if primulas were absent.

Messrs. J. Carter and Co. have taken a foremost position among those who have been responsible for the evolution of the Chinese or florists' primula, but although you must go, or send, to Holborn for seeds of their fine varieties of these flowers, you must journey to Forest Hill to see the flowers themselves. During February and early in March many houses are filled at the Houston Road Nurseries with batches of the many delightful varieties for which the Holborn firm is deservedly famous. Every care that long years of experience can suggest is taken to keep the primulas up to the high-water mark of perfection in habit, freedom, and size of truss and bloom, and every year new crosses are made and colour variations carefullly selected for further development for the purpose of still improving on the existing varieties. Some varieties offered fifteen years ago have been superseded, and there are now small stocks of improved strains that promise, in due course, to surpass the best of to-day. The advance is necessarily slow in the case of such a highly bred flower, but it is none the less sure. A Holborn primula is but another title for a first-class primula.

A quite considerable number of varieties are offered by Messrs. James Carter and Co., but it is not necessary to enter into minute details concerning them, especially as in the present issue there appears a life-size reproduction of a young plant of a variety named Princess May, and this may be taken as a good example of the type of plant and flower produced by these eminent seedsmen and florists. Princess May has blush-coloured flowers, with a bold orange-yellow eye. King Edward is one of the finest of white varieties, and has fringed flowers of great substance and beauty. Elaine is a quite old white variety as primulas go, and though surpassed in form of flower by its newer relatives, it is so wondrously free flowering that the demand for it is always large. Holborn Queen is another white primula that is interesting, because its giant flowers are produced all through the primula season, there being no loss in size as the season advances. A new giant white selection, with finely formed, solid flowers, promises to be an improvement on King Edward, while White Bouquet, with its big foliar calyces, provides an interesting development, as well as a good display of big white, orange-eyed blooms.

Among the bright colours Crimson King still holds a prominent place, the colour being very bright and pleasing, while Giant Crimson is of excellent colour and has the larger flowers. Holborn Carmine is extremely popular, and it is specially useful because when all the Holborn varieties are sown at the same time, this one invariably comes into bloom ten days or so earlier than all the rest. It is very free, and gives very large trusses of bloom. Giant Salmon, with bright flowers measuring from 2¼ to 2¾ inches across, commends itself to the connoisseur and the competitor; it is a magnificent variety in every way. Holborn Pink is another delightful variety, while for those who like the colour Giant Magenta is splendid, being exceptionally large and free.

The development of the blue shades is proceeding apace, and there are some very charming selections in both dark and light blue that promise well for the future. For the present The Czar, for a dark, and Light Blue, for a paler shade, fill the bill, though it must be confessed that Light Blue inclines rather towards lavender.

There are many other varieties of both giant and ordinary types; a fine range of colouring is the six distinct varieties of Star primulas, i.e., white, pink, salmon, lilac, blue, and crimson; and a splendid set of double varieties represented by Prince of Wales, salmon; Violet Queen, bluish-purple; Double Crimson, rich crimson; Aurora, blush-pink, and a great favourite for cutting from; Double Scarlet, very bright; and Snowflake, pure white.

LEEKS.

Though the leek may be regarded as a quite common vegetable, and one of the easiest to cultivate, because it is perfectly hardy and adapts itself to any soil or locality, yet it is nevertheless one of the most difficult to produce in the very height of perfection. For some reason the leek is more appreciated in the northern districts than in the south. Valuable prizes and keen competition for leek culture are frequently to be met with in Scotland and in the North of England, and, I venture to say, few vegetables give more pleasure to the keen cultivator than does the leek.

Seed sowing should be done at intervals from January to the middle of April, according to the time at which the specimens are required. The seeds are best sown thinly in shallow boxes filled with a light compost, and raised in gentle heat. Immediately the young plants are large enough, they should be pricked off into other well-drained boxes of from three to four inches in depth, and grown under glass, always endeavouring to promote a sturdy growth; thoroughly harden before planting out.

The best results may be looked for when the plants are cultivated in trenches much in the same way as those prepared for celery. These should be taken out and prepared during the month of March, and left in this condition until planting time comes round. As far as possible, choose an open sunny site, especially for the early plantings. Sufficient distance should be allowed between each trench for the work of watering, earthing, etc. At least one foot of good half-decayed manure should be placed in the trenches, and if the soil is of a very stubborn and unkind nature it will well repay to add from four to six inches of some nicely-prepared compost of a lighter nature.

Assuming the weather is favourable, the earliest plants should be put out about the middle of April, from twelve to fifteen inches apart, with a garden trowel. Make them very firm, and give a thorough watering in. In case of very cold winds the plants should be sheltered in some way, and the tops be frequently damped to prevent them from flagging. Where plenty of room and convenience is at hand the young plants may be cultivated in pots previous to planting out.

Blanching is the most important item in connection with successful leek culture. Here, let me point out, it is absolutely useless to cultivate the plants well and attempt to blanch them afterwards. This work should be commenced immediately after the plants are put out into the trenches, and can only be properly accomplished by using much care and attention. There are many methods practised, but the best I know is the use of brown paper collars, which are now sold for the purpose. These are placed over the top of each plant, with a small stick on either side to keep them in an upright position, at the same time placing a little fine soil around each to exclude light and air. After this place a nine-inch plank on either side, thus forming a kind of box about ten inches in width. The plants should be examined frequently, and the collars drawn up as the blanching proceeds, each time adding sufficient finely sifted soil of a poor nature around the base until the desired length of blanching is acquired, when the collars may be entirely removed, and a little clean wheaten straw placed carefully between the plants to prevent heavy rains splashing the soil into the axils of the leaves. This simple plan of fixing boards has much to recommend it, as the roots are not then buried to an unnecessary depth, which must of necessity occur when the plants are banked up. Watering and feeding can be carried out in a much more efficient manner also.

The leek is a moisture-lover, and it should not be allowed to suffer for the lack of it, either at the roots or overhead. Abundance should be given both in a clear and liquid manure form during the growing season, and in showery weather some reliable fertiliser should be applied, according to instructions. In very hot, dry weather place about three inches of half-decayed horse manure over the roots. Leeks grown in this way, whether required for exhibition or home consumption, are in every way superior to those grown in the ordinary way, as the blanching is much more perfect, and grit, which is most objectionable, does not get into the axils of the leaves.

For late spring supplies very good results may be obtained by heavily manuring and thoroughly trenching a piece of ground in an open position. Deep holes should be made with a crowbar, and the young plants let down to the depth of about a foot, afterwards working the finest of the soil round the plants, but this can only be relied upon for quite ordinary use.

There are several splendid stocks now to be purchased, and the very best only should be chosen. International, Prizetaker, and Improved Lyon are each good, and can be thoroughly relied upon when the seed is obtained from a first-class house.

Aldenham Gardens. E. Beckett.

CANARY GUANO.

"The Best in the World."

There is no fertilizer quite like Canary Guano. It is used in the King's gardens, is perfectly clean, and has no unpleasant odour. Improves and renovates lawns; does not mould on the surface of pots. Unsurpassed for use for Exhibition purposes.

NATIVE GUANO

BEST and CHEAPEST MANURE for VEGETABLES, FRUITS and FLOWERS.

Price **£3 10s.** per ton in bags. Lots under 10 cwt. **4s.** per cwt. at works; or **5s.** per cwt., carriage paid to any station in England.

Extracts from 32nd annual collection of reports:—
NATIVE GUANO for POTATOES, VEGETABLES, etc.

J. HAYDON, Hampton: "Potatoes, excellent crop; none diseased. Grand for keeping away slugs."

G. PERRY, Westcliffe: "Peas and onions splendid"

NATIVE GUANO for FRUIT, ROSES, TOMATOES, etc.

A. W. BRINKHAM, Hull: "Cucumbers, tomatoes, and chrysanthemums highly satisfactory." G. ACCLETON, Carlisle: "Finest manure ever used for vines, peaches, roses, carnations, etc." W. COOPER, Shoeburyness: "Most excellent for roses."

Orders to the **NATIVE GUANO CO., LIMITED**, 29, New Bridge Street, London, E.C., where 32nd year's testimonials, etc., may be obtained. Agents Wanted.

ONCE USED. ALWAYS USED.

The 'PATTISSON' LAWN BOOTS

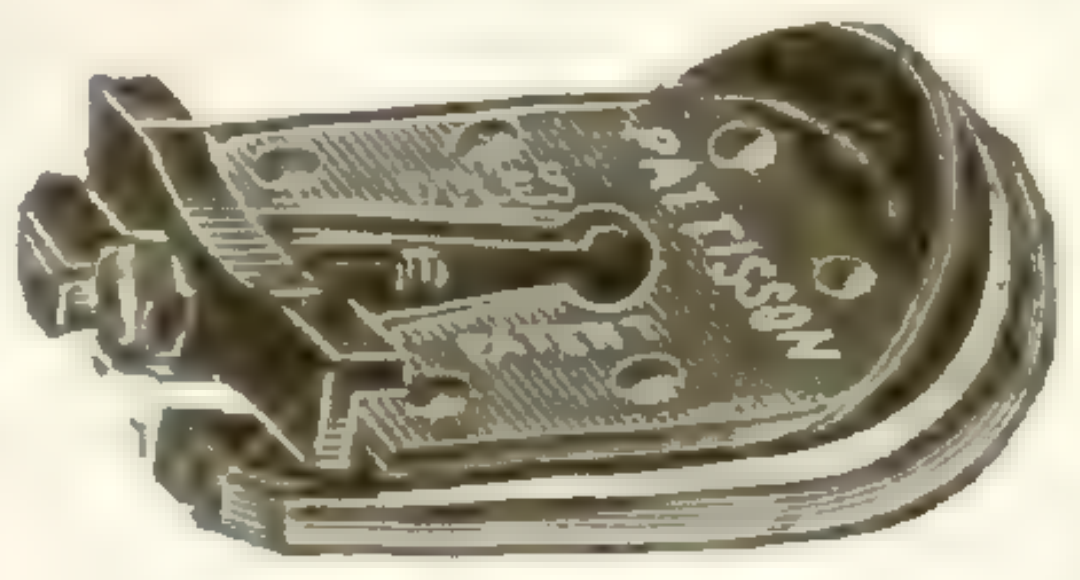

FIG. 1.

Simplest! Strongest! Most Economical!

Soles of Best English Sole Leather (Waterproofed) with Motor Tyre Rubber Studs or **Solid Rubber.** Fig. 1 can be REFITTED repeatedly, equal to New Boots. **Rubber Soles strongly recommended.**

Used in the ROYAL and in thousands of the PRINCIPAL GARDENS.

Silver Medal—
Royal Horticultural Society.
HUNDREDS OF TESTIMONIALS.
The Field says: **"As good as anything that could be devised."**

GARDENS ROUND TORQUAY—II.

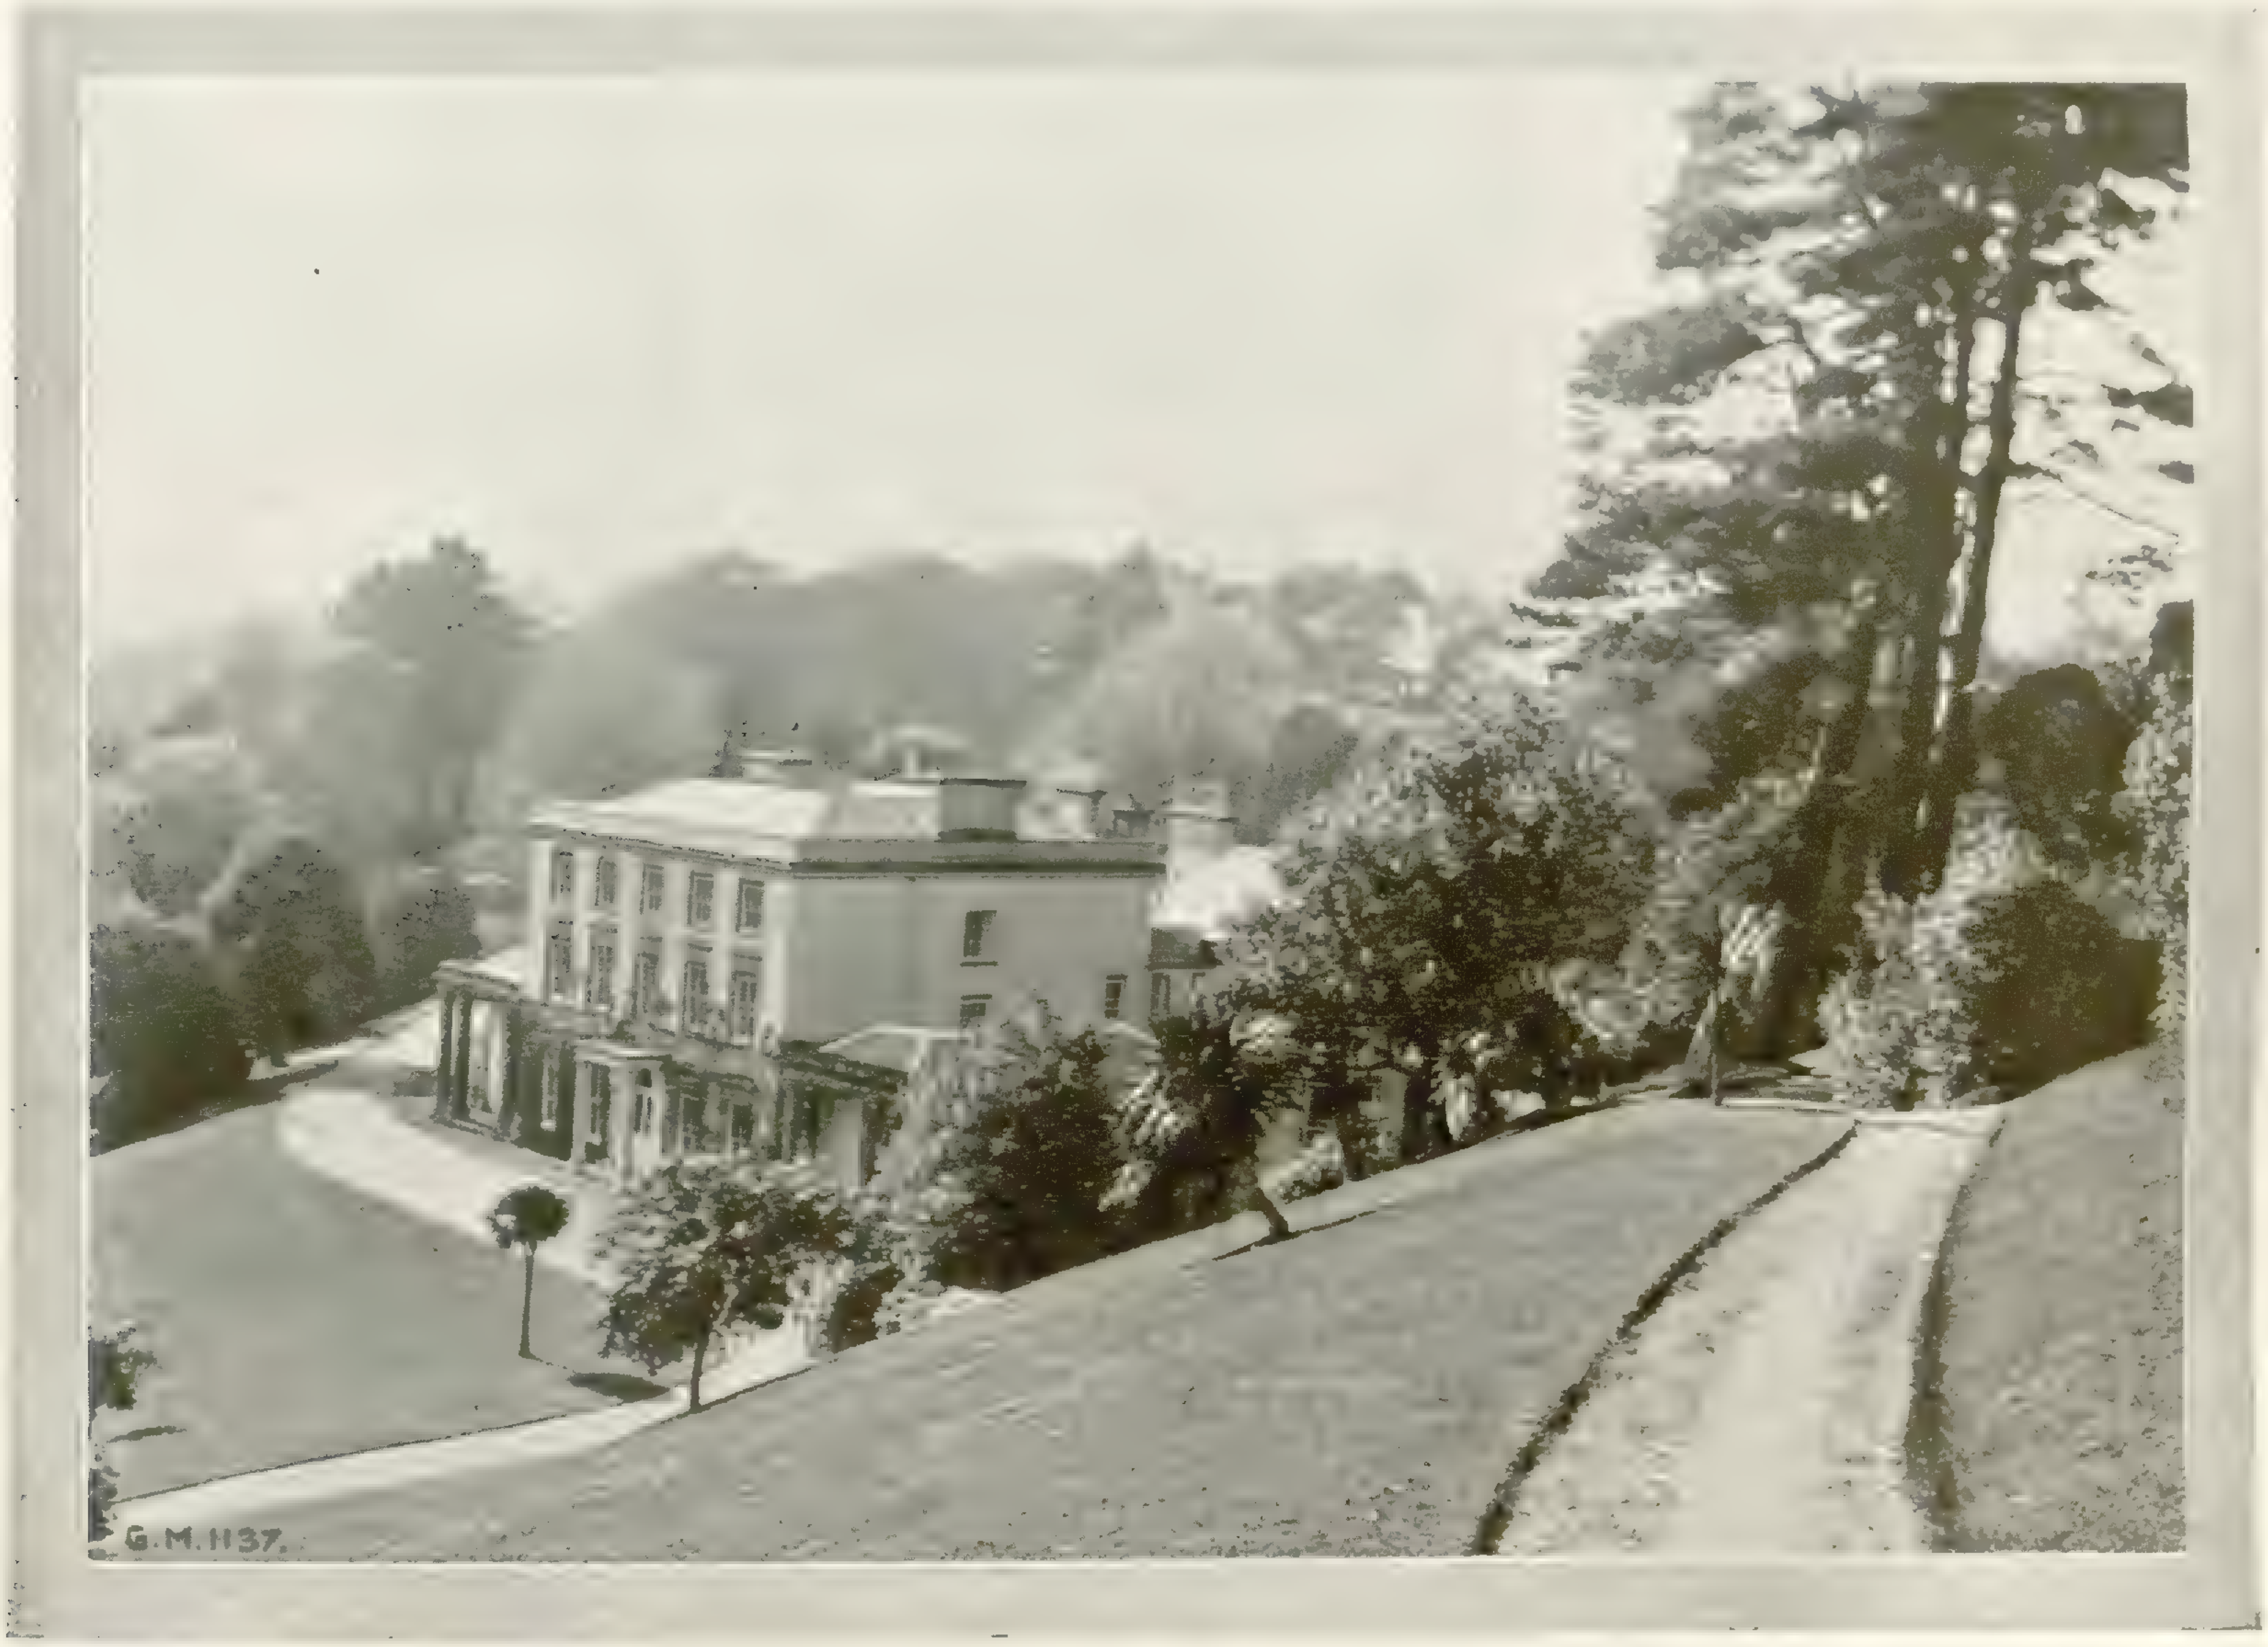
Greenway House.

Of a quite distinct character to other gardens in the Torquay district are those of Greenway House, the seat of T. B. Bolitho, Esq., which have long enjoyed fame for their richness in the choicer forms of arborescent vegetation. The numbers and development of rare trees and shrubs that have a place in them are indeed so remarkable that those who visit the gardens for the first time might well be excused were they for a moment to indulge in the supposition that by some unknown means they had been transported to a clime more kind to tender vegetation than even that of Devonshire. There would certainly be no difficulty when walking through the grounds and admiring the many rare trees and shrubs that claim attention, in imagining that the garden was in some temperate region where frost is unknown rather than in this England of ours with its great variations in temperature, from the effects of which the western counties do not wholly escape.

Greenway House is about nine miles from Torquay in a south-westerly direction, and the mansion with its picturesque grounds occupies a prominent position in the woods that overhang the Dart, which, by reason of its great beauty, has been spoken of as the English Rhine. But Devonians who know the two, consider that an injustice is done their own river by bracketing them, and they have certainly good grounds for their contention. As once the residence of Sir Walter Raleigh, and the birthplace of Sir Humphrey Gilbert, Greenway is rich in historical associations, but there is too much of interest in the gardens to permit of their having even the briefest reference made to them. The grounds are eminently picturesque, as will be seen from the accompanying illustrations, and the mansion occupies a site on the plateau about midway between the river bank and the fine old Scots firs that stand out prominently on the higher ground and contribute their share to the beauty of the scene. From this position the mansion commands a prospect in which land and water combine to form a picture of incomparable loveliness.

Within a short distance of the mansion are a goodly number of coniferous and deciduous trees, remarkable for their large size and perfection of development; but it is interesting to note that they are so placed as not to interfere in any way with the views obtainable from the windows or the open lawn in front. There are large numbers of finely developed trees of the kinds that are not usually met with in gardens, and were they to have the special mention they so fully deserve they would form a somewhat lengthy list.

Reference can alone be made to the rarer kinds, and consequently we at once pass on to what is known as the battery garden. Here we find a specimen of Guevina avellana that has certainly no equal in the United Kingdom. The tree, which belongs to the natural order Proteaceæ, is a native of Chili, and was distributed many years ago by the late Mr. William Bull, but the Greenway specimen must have been planted some time previous to that event, as it can hardly be less than fifty years old. It is now some twenty-three or twenty-four feet in height, and has a spread of over twenty feet, thus very closely approaching the dimensions to which it attains in Chili, of which country it is a native. The leaves are coriaceous, impari-pinnate, and have ten, twelve, or fourteen leaflets, of which the lower pairs are pinnate, and, as they depend in a graceful manner they give a very pleasing appearance to the tree. The flowers are borne in August in erect racemes, are ivory white, and these are followed by small fruits, green at first, and eventually becoming purple. In its native country the fruits are eaten as an article of food.



GREENWAY HOUSE—THE MANSION.

In the same garden are white, crimson, and other camellias, which grow vigorously and bear each year a profusion of flowers, and spreading over a large area of the wall that bounds one side of the garden is a fine specimen of Rhynchospermum jasminoides. Here also are well-developed specimens of the handsome Fan Palm, Trachycarpus excelsa, and the bold-growing New Zealand flax, and a remarkably fine specimen of Callistemon speciosus, which annually produces its scarlet flowers in great profusion. The green-leaved and variegated forms of Phormium tenax are well represented, and there are many fine examples of P. tenax, P. tenax variegata, and P. Colensoi variegata, and of the first-named the most remarkable specimen is one nine feet high, growing on the bank of the Dart, within a short distance of the mansion. Hereabouts also are some of the finest of the bamboos and several yuccas in a high state of development.

GREENWAY HOUSE—VIEW DOWN THE RIVER DART.

Among the shrubs of special interest that grow in the open at Greenway with greater vigour than with the shelter of glass and the aid of fire heat in other districts are Acacia armata, a grand specimen eight feet or so in height and not less than ten feet in diameter, and A. verticillata, also of large proportions; Azara microphylla, not less than twenty feet in height; Boronia Drummondi, and B. megastigma; Abelia floribunda, which annually blooms freely; Eriostemon nerifolium; escallonias, great masses ten to twelve feet high; Clerodendron trichotomum, represented by a grand specimen that blooms with great profusion; the elegant white-flowered Choisya ternata, with its profusion of fragrant blossom; Garrya elliptica, Arbutus unedo, and some other shrubs that are hardy elsewhere, but require favourable conditions for their full development, are represented by specimens of exceptional size. The brilliantly coloured Embothrium coccineum grows vigorously, and in each recurring spring the great masses of rich crimson flowers produce a brilliant effect. Very fine also are Benthamia fragifera, Photinia serrulata, Pittosporum Mayi, and P. nigrum, both of which bloom freely, and present an attractive appearance at all seasons of the year. It need hardly be said that where the foregoing thrive rhododendrons flourish also, but it should be mentioned that both tender and hardy kinds are represented by splendidly developed specimens, some rising to a height of twenty or more feet.

Mention has been made of the fact that the elegant Rhynchospermum jasminoides flourishes on the open wall, and it should be added that a number of other climbers that are properly regarded as belonging to the greenhouse succeed equally well without the aid of glass. The handsome Clianthus puniceus and its beautiful white form cover large spaces on the open wall, and each of the specimens annually produces hundreds of flowers. Jasminum primulinum is in an equally thriving condition, and blooms with remarkable freedom. Plumbago capensis, Swainsonia albiflora, Cassia corymbosa, Indigofera Gerardiana, and Bignonia radicans, B. Cherere, and some other species are also of interest for the manner in which they flourish in the open.

There are many other trees and shrubs in these interesting gardens that should have special mention, but sufficient have been enumerated to show how remarkable is the collection of comparatively tender subjects. That Mr. Bolitho takes the keenest of interest in the several features is sufficiently obvious, and it is not less obvious that Mr. Murley, the able gardener, is fully versed in all that relates to the cultural requirements and the history of the many noteworthy plants under his care. It should, however, be mentioned as a matter of interest that Mr. Murley has had the honour of winning several valuable silver cups for his employer with spring-flowering trees and shrubs.

Roby Hall.

This important seat, which has passed into the possession of Sir John Edwards Moss, Bart., by purchase within a recent period, occupies a delightful situation in the open country a few miles to the north of Torquay, and is very properly regarded as one of the chief centres of horticultural activity in the district. Sir John is an enthusiastic gardener, knows trees and shrubs well, fully understands the management of woodlands, and is so greatly interested in orchids that he has formed a collection that is not less remarkable for its extent than for the number of choice hybrids it contains, and the success achieved in their cultivation.

Roby Hall was built and the grounds designed and laid out by Brunel, the famous engineer, but it had for some years previous to the estate passing into the hands of Sir John Edwards Moss been unoccupied, and as this period included the time when in the ordinary course of things, gardens of recent date require some revision, they have suffered somewhat here and there from overcrowding. Much has been accomplished in the thinning of specimen trees where it has become necessary, and in the clearing up of those parts of the ornamental woodlands that had become overgrown. What has already been done indicates a happy combination of vigour and caution on the part of the owner, and in a walk through the grounds it was surprising to find how closely he was acquainted with every tree and shrub, and how full was the consideration given to every specimen where the removal of one or more had become necessary.

Briefly stated, the mansion occupies a position on the high ground at the head of a small valley that trends in a southerly direction, and, as the lower part has been kept free from trees with the exception of specimens standing singly, a fine view from the mansion is obtained of the country beyond, with some of the higher parts of Torquay in the distance. The sides of the valley are flanked by woodlands, and on the margin thereof coniferous and deciduous trees, and rhododendrons, with other choice shrubs have been planted. These have all attained to goodly dimensions, and, as they are, for the most part, finely proportioned, the vista thus formed is one that at once attracts attention and compels admiration. This area has been greatly improved by the formation of bold groups of shrubs in suitable positions, these including several of mollis and Ghent azaleas, which in a few years hence will add immensely to the colour effects during the spring months. There are also fine masses of hardy herbaceous plants of bold growth that are now so well established as to contribute liberally in their season to the general effect.

The coniferous trees that fringe the woodlands comprise a large proportion of the finest kinds that were in commerce thirty years or so ago, and the major portion are so splendidly developed that were they to be mentioned in detail it would be necessary to speak of them in highly appreciative terms. Seldom are such perfect specimens of the Chilian Pine (Araucaria imbricata) met with, for in many cases where the growth is light, it is spare also, but here the growth is characterised by lightness combined with sufficient density to give boldness also to the trees. Many of the cedars and firs are also especially noteworthy for their handsome contour. Among the more noteworthy of the rarer trees were Pittosporum Mayi, about thirty-five feet in height and perfect in development, and Ilex pectinata, with a height of about twenty-five feet and of a similar diameter. Of a different character, but of much interest, is the large tree of Gleditschia triacanthos, that is seldom met with in such excellent condition.

The formal flower gardening is confined chiefly to the terrace, where it is customary to have spring and summer displays, and not far distant from the mansion are the structures devoted to the fine collection of orchids. There are some five or six of these, all with span roofs and arranged parallel with each other, and connected with a broad corridor at the north end. Not only is the arrangement of the houses in accordance with the most advanced ideas, but the heating arrangements, the ventilation, and shading are also of the best. The plants evidently appreciate the conditions under which they have been placed, for the collection, which comprises about 5,000 plants of various sizes, is in the finest possible condition. To give the names of those which are especially noteworthy would involve the preparation of a somewhat lengthy list, and it is therefore necessary to limit the reference to a statement that the collection comprises many of the finest of the bigeneric and other hybrid forms of cattleyas and lælias, hybrids of cypripediums and odontoglossums, and a long range of choice varieties in the several groups. A short distance from the orchid houses there is a fine range of houses devoted to fruit culture, with an aggregate length of upwards of 250 feet. Of these three are devoted to grapes, three to peaches and nectarines, and two to cherries, and there is so much that is of interest associated with them that it is a matter for regret that it is not possible to refer to them otherwise than thus briefly. These are new, and have been planted within the past few years, and the excellent growth that has been made and the splendid crops that have been produced testify to the skill of Mr. Luckhurst, the head gardener, in the management of this, as of the other departments, of these important gardens.

ROBY HALL—TULIPS IN THE TERRACE GARDEN.

Normount.

Prominent among the gardens that spread over the lower slopes of Warberry Hill, which rises a short distance to the north-east of the centre of the town, are those of Normount, the residence of Miss Chadwick. These gardens are some of the largest of those near the centre of Torquay, and the widely spreading lawns, the finely developed trees, the examples of subtropical vegetation, and the tastefully arranged flower beds form an admirable setting to the handsome mansion, and afford much that is pleasurable and interesting to visitors, whether of a horticultural turn of mind or otherwise. On the lawns are handsome specimens of coniferous and deciduous trees, the Australian dracæna, large in size and robust in health, and groups of choice shrubs, and in the lower part of the ground is an excellent example of rock gardening, the bold rockery extending for a considerable distance alongside the carriage drive.

At the time when these notes were made flowers that belong to the spring were in the ascendant, and very attractive were the displays that had been produced by Mr. F. E. Peacock, the head gardener, in the association of bulbous and fibrous-rooted plants. Especially beautiful was the arrangement of the beds alongside the lower terrace walk which has an additional charm in the line of handsome Irish yews that extends its whole length. The hyacinths, it need hardly be said, were over, but the tulips were in the zenith of their beauty, and rising from carpets of double arabis, aubrietias, wallflowers, and other plants of lowly growth, they produced a charming effect. The upper terrace walk to the left of the Irish yews leads to a handsome summer house, and the wall, with its beautiful vases, affords support for a considerable number of shrubs and climbers that are remarkable either for rarity or beauty, or it may be for both. Along the front are masses of the finest of the aubrietias, and those who are acquainted with these free-blooming subjects will have no difficulty when glancing at the illustration in understanding how beautiful is the effect produced by large, dense masses, such as those Mr. Peacock is successful in obtaining. There were also in the border groups of golden alyssum, the double white arabis, and May flowering tulips.

On the other side of the wall that is illustrated is the kitchen garden, but it has been so far diverted from its original purpose that it is now almost wholly devoted to flowers and fruit. Very attractive here was the large border, in which golden and crimson polyanthuses and wallflowers combined to produce a rich display of colour. The bold masses of herbaceous pæonies produce in their season a glorious effect, and the carnations form a delightful feature, for they are grown in immense numbers and with much success. Raby Castle, which has long been in general cultivation, is a great favourite at Normount, and many thousands of blooms are annually produced. Annual flowers are also cultivated extensively, and special attention is given to the fragrant sweet peas, and the method of procedure is so devised that a succession of flowers is maintained over the longest possible period.

NORMOUNT—AUBRIETIA BORDER AND SUMMER HOUSE.

Cockington Court.

Of the many "beauty spots" within a quite short distance of Torquay pre-eminence might probably be given to the Cockington district, but, as there is no occasion to institute comparisons between the charms of the various points of interest, the preferable course will be to state that there is not one that can be regarded as superior to that in which Cockington Court is situate. For upwards of two and a-half centuries this fine old manor has been the home of the Mallock family, the present owner being Captain Mallock, who, as in the case of many of his ancestors, takes the keenest interest in his fine seat. Nestling amid the wide-spreading trees that form so characteristic a feature of the valley, the village of Cockington, with its thatched cottages standing in gardens fragrant with the blossom of many an old-fashioned flower, takes us back to the distant past, and affords an excellent representation of village life as it existed a century or more ago under conditions favourable to the health and happiness of the participators therein. Torquay, some two miles distant, reckoning from the centre of the town, has extended its borders to within a short distance, but the village, with its old time associations remains unchanged, and withal is so beautiful that there is no occasion for surprise that it should be the haunt of the artist who has a taste for depicting rural life as it exists amid picturesque surroundings.

The village clusters around the two entrances to the Cockington Court demesne, and of these one is modern and the other ancient, and the latter, an old timber-fronted lodge, probably takes us back to a date anterior to the purchase of the property by the ancestor of the present owner. The mansion stands some distance from the entrance lodge, and the carriage drive passes through sylvan scenery of exquisite beauty. At one point the banks are clothed with the hart's-tongue, which revels in the conditions that obtain, and attains to a degree of development quite unknown to those who have not had an opportunity of seeing this fern growing in the western counties, where it can enjoy the equability of temperature and the atmospheric humidity necessary to the full development of the dark green strap-shaped fronds. Farther on, the carriage way intersects a beautiful tract of woodland of considerable length in which Himalayan rhododendrons produce glorious displays during the spring months. Some overhang the drive, others stand up boldly among the underwood to a height of twenty or more feet, and all so splendidly flowered as to prove to demonstration that the conditions which obtain are equally favourable to the growth and ripening of the wood. Within this wood are several lakes of considerable extent, and very attractive in one of them were the reflections of the rhododendrons with the tender green leafage of the deciduous trees as a background.

Emerging from this fine tract of woodland the road again passes into the park, and the scene looking up the valley with the manor house and the ancient village church near the head, is so beautiful as to make an impression not likely to be soon effaced. The rising ground to the right and left are finely clothed with woodlands, and in the open space are many timber trees of noble proportions. The grounds surrounding the mansion are in the natural style and in keeping with the environment. Hardy plants are fully utilised and successfully cutivated, and prominent among the flowers employed in the production of the spring display was a remarkably fine strain of polyanthuses. On the grassy slopes of the lawn the double white anemone was flowering freely, and the myriads of pure white flowers peeping above the bright green blades of grass presented a delightful effect. One of the great features of Cockington Court is that formed by the hardy rhododendrons which were planted in the woods some years since in immense numbers. These are not varieties of Rhododendron arboreum or R. ponticum, but consist of the choicest hybrids, and in the season of flowering the thousands of trusses in their diversity of colouring must be wondrously attractive.

The kitchen garden at Cockington Court must, it might well be imagined, be a veritable heat trap, for in a hurried run through them, Mr. B. Richards, the head gardener, was able to point to crops of potatoes, peas, and other vegetables that were fully a month in advance of similar crops in gardens round London, and much earlier than those which had come under notice elsewhere in the neighbourhood.

Walton Lodge.

In the gardens of Walton Lodge, the residence of H. G. Cumming, Esq., rock gardening has of late years undergone considerable development, and those who have an affection for the many beautiful alpine plants that are now in cultivation find much to interest them. Flanking the terrace walk that runs immediately in front of the residence, and extending some distance beyond are spacious flower beds, in which both spring and summer displays are annually produced. Of the latter it is not possible to speak from personal knowledge, but, judging from what had been accomplished in the use of spring-flowering plants it is not difficult to imagine that they are at once effective and tasteful. The illustration of this part of the garden shows that tulips were freely planted, and that they were arranged amid wallflowers and other suitable plants. The two wallflowers the most largely used were Primrose Dame and Ruby Queen, whose colours are indicated by their respective names. On the walls are clematis in variety, the elegant Banksian rose, myrtles, ceanothus, Carpentaria californica, Bignonia radicans, and other plants that may be utilised in such a kind climate as that of Torquay for the clothing of wall spaces. In the borders are fan palms in a high state of development, and near by are fine clumps of herbaceous pæonies, the Austrian briar rose, and other noteworthy objects, and on the far side of the lawn is a pergola of recent construction that at no distant date will form a distinct and attractive feature.

At the western end of the residence is a small rock garden, in which the plants are fully established, and produce in their respective seasons a bright display of flowers. Aubrietias, candytufts, and other free-growing plants have been the most largely planted, and form large masses of foliage and flowers. At the bottom of the sloping lawn, and in a somewhat retired part of the grounds is the spacious rock garden, which has been formed within the past few years, and is rapidly becoming a highly attractive feature. The general character of this garden is well shown in the accompanying illustration, but the strong contrasts, due to the brilliant sunlight and deep shade of the trees, are not favourable to a pleasing representation of the various plants that find a home within its boundaries. This garden is of special interest as an indication of the possibilities of cultivating under favourable conditions a collection of alpine plants in a space that had been occupied by trees and shrubs of no great value from the decorative point of view, and the object lesson it affords is one that well deserves the attention of those who appreciate the manifold charms of rock plants.

George Gordon.

NORMOUNT—SPRING FLOWERS ON THE LOWER TERRACE.

MIGNONETTE.

Some will be surprised to hear that failures in growing this ubiquitous garden annual are not uncommon, but it must be remembered that many of even the commonest garden weeds need certain conditions to enable them to survive in the struggle for existence. It is essentially a plant of the chalk, doing its best on limestone and chalky soils, and often making poor weedy plants on damp and rich garden soils which are deficient in lime. On the latter class of soil, especially if they are of a very heavy nature, mortar rubbish is the best dressing that can be applied when preparing the soil, all animal manure being withheld. It is seldom, indeed, that mignonette fails to do well on account of the poorness of the soil, while, if mortar rubbish is not available, lime or basic slag should be used instead.

Early in April is quite soon enough for sowing the seed in the open ground, but if specially fine plants are wanted seed of one of the stronger-growing varieties should be sown towards the end of March in a cool house or frame, from which frost is excluded. The seedlings should be carefully planted out singly in sixties as soon as they are in the third leaf. The seedlings are not readily transplanted, and some will be spoiled in the process, while many more will be lost in an earlier stage if the soil is kept too damp, or too little air is given. The mignonette is undoubtedly best suited for dry, open, and sunny positions. If plants raised in this way are put out at the latter part of May in deeply-cultivated soil, and some little attention given them in the way of thinning out weakly shoots, fine specimens will be obtained. When sowing in the open some of the best situations are dry banks, narrow margins of soil between gravel paths and brick walls, and any clear spaces in sunny flower borders. In wet soils mignonette often fails to make its appearance owing to the depredations of slugs.

As regards varieties, they are many, and every nurseryman's catalogue mentions several. For perfume none is any improvement upon the old common mignonette, but many are better in colour. Machet is a very popular variety, grown largely in pots for the London market, its bold spikes of reddish flowers being familiar to all. For an all round sort, to be used for pots, or the open ground indiscriminately, it is perhaps as good as any. There are varieties of various shades of red, crimson, and yellow.

Alger Petts.

Globe Artichokes.—These will now require to be taken in hand. Remove the protecting material, and trim off neatly all the decayed parts of the plants, finally digging in a good dressing of decayed manure and ashes if the ground is of a heavy nature. If cold winds prevail place spruce boughs on the northern side until the growth is accustomed to exposure.—G. E.

THE POTATO CROP.

The time of year is now with us when planting potatoes will be seriously claiming our attention, especially the earliest plantations. It cannot be too strongly impressed upon those who have had only a limited experience with kitchen gardening that much of the success or failure of the crop depends on how these preparations are carried out. One of the foremost considerations should be to have the sets in proper condition at the time of planting, which means that they are furnished with three green, short, strong, sturdy growths from their leading eyes, the others being removed as they appear. This detail may seem trivial, but it goes a long way towards a supply of even-sized tubers at lifting time. To secure this desirable end the potatoes should have been placed in boxes with their large end upwards, in a cool position, and fully exposed to the light. The result of leaving them in too warm a temperature is to produce drawn, blanched growth, which has to be rubbed off, and helps to weaken the forces of the potatoes, so that proper support is not given to the young shoots when they require it after planting.

The First Planting.

The time to plant will largely depend upon the part of the country and the position of the garden, but in most cases early March plantings require some form of protection, such as glass lights or matting over them during cold winds or frost, and can only be regarded as crops to carry over a short period, and should be made in small proportion to the other plantations.

An excellent position for an early crop is to plant a row a foot from a south wall, and running parallel with it. The wall helps to conserve the heat of the soil, growth is active, and, should protection be required, it can be easily given by placing boughs or canvas over the plants. In any case the early batch should be planted on the warmest borders available.

There are many good and reliable varieties, and Ashleaf Kidney is generally most suited for the earliest crop, as it is very compact in growth. One called Field's Seedling has done remarkably well here for a few years; May Queen is satisfactory, and with many Duke of York is a great favourite.

If the ground has been manured and dug early, and exposed to the winter frost and winds, it will be in good condition, and will only require the drills to be cut out at two feet apart, and about four inches deep. Place the sets twelve inches apart. A dressing of wood ashes is always of assistance to this crop, and can be easily applied by spreading it along the trench when planting. Fork the soil back over the drills, leaving the top in an evenly moulded condition for the growths to push through.

The Second Planting.

This can be made in larger proportions on a wider and open border, and for such planting the larger and stronger-growing potatoes are very prolific, such as Epicure, Royal Kidney, and Snowdrop, which is yet unsurpassed for cooking quality. To afford them room for growth six inches more is allowed from row to row, and three inches more in the row. In other respects they are planted similar to the earlier planting. Strict attention should be paid to keeping the growths moulded up to protect the stems against late frosts, as damage from this very seriously affects cropping—more so than is generally supposed.

Labour in moulding is not wasted, as the periodic moving of the soil is beneficial to the plants, and, with about three earthings up, the moulding is finished. If the growth is not satisfactory a dressing of the special concentrated manures that are offered are of value if sown between the rows when rain is anticipated.

The Main Planting.

From the middle of April to May the main, or late, planting will be made. From various experiments carried out myself and from observation made, I am convinced that the practice, so often carried out by farmers, of planting their potatoes directly over new strong farmyard manure is a wrong one. It is much better to work the ground early, adding the manure a month or two previous to planting. New manure forces soft top growth, which is particularly liable to disease, and is made at the expense of the tubers.

As potatoes vary so much both in cooking qualities and productiveness in different soils and positions it is difficult to recommend varieties for general acceptance, but, so far as I have been able to judge, we cannot yet leave out of the list the comparatively old varieties (as potatoes go), such as Up-to-Date, Scottish Triumph, and Duchess of Cornwall. These all did well last season here in every respect. Maincrop is a splendid cooking variety, but is inclined to be light in crop. Reading Giant also does satisfactorily.

In planting these late sorts two feet six inches should be allowed between the rows, and a distance in proportion from plant to plant in the row. During the growing season we actively employ the hoe between the plants until they are ready for the final moulding up. As previously recommended for early varieties, apply a dressing of artificial potato manure between the rows if it is seen that growth is not making proper progress.

WALTON LODGE—THE ROCK GARDEN.

AMONG THE ROSES.

So far as the present year has gone this has not been a season when the usual calendarial work could be carried out with advantage. Everything has been so abnormally wet, and the weather so unseasonably mild, that one could not keep up with work, and avoid getting on the ground without risk of doing more harm than good.

But whatever the weather may be at the end of this month, I shall commence pruning, even if we have to use boards to walk on. Personally, we are better off than many of our neighbours, our grounds laying fairly high, and on the slope from due north-east to south-west. Still, we are much handicapped by the persistent rains However, unless one takes every opportunity now we shall probably be overtaken by excess of absolutely necessary work shortly. Roses planted during the past season can be cut back to advantage much earlier than the established plants, and if, after doing this we loosen the surface soil a little, and then apply a mulch of manure, I think we gain by earlier pruning. Almost all soils have settled down very closely and firmly through wind pressure and rain, and my experience tends towards early spring mulching in preference to any winter dressing; especially during such a season as we are passing through, when a great deal of plant food is wasted.

Upon solid ground, and with established plants, I should not hesitate to prune the hardiest of the varieties. Here again, after raking off the trimmings, I would mulch and then turn over the soil just enough to partly cover the manure. The advantage of this will be obvious when the hoe gets to work presently. Owing to the mildness climbers are unusually precocious, and, so far as possible, I would do the bulk of the work among these at once.

I cannot advise any further transplanting of roses from the open ground, unless exceptional care be taken, but one can easily fill up gaps, or even plant entire beds, from plants out of pots. In the case of teas and their hybrids this is a safe and satisfactory method late in the season. As soon as we get brighter weather one must expect everything to grow away rapidly, and as the plants now in the ground are making root growth freely, it is not advisable to mutilate the roots by late planting, with the risk of drying winds and growing weather so close upon us. Much of this is avoided in the case of pot plants, because only a very few of the roots are disturbed, and their activity is continuous.

In one way it has been a very trying season for standards. So far as the briars for stocks are concerned, the wind has blown them about a great deal; but, apart from this, we have so far been fortunate in escaping the killing effects of a keen dry wind, and I know of nothing more trying to newly-planted standard stocks than this. But both in the case of briar stocks and roses, wind-waving has been inevitable, unless the plants were secured effectually at the time of moving. Whether it is a standard or dwarf plant the majority of them will be found to sway, leaving a smooth-surfaced hole at their base. This is always harmful, and I would loosen the soil around the base of the plants before setting them up straight once more. To a great extent this avoids strain upon the roots, which are certain to be active by this time. A wind-swayed plant will suffer more or less all the summer unless this smooth hole has been filled up.

I write in the middle of March and we have not a rose stock planted, with the exception of standards from the hedgerows. Out of the quantity to do we have generally got in some ere this, mostly by digging and planting according as the ground was prepared for a row. Where the ground was dug during winter most of it will be too wet to work upon yet, and I would prefer to wait until fairly good weather arrives.

Roses should be coming on very rapidly under glass now, and in spite of so little sun they are well up to the usual date. Now, too, is a very critical time with insects and mildew. Wage war early. This is old advice, but none the less sound. I prefer a careful use of natural liquid manure to any chemicals for stimulating the plants.

So far as we have put the knife among our roses, there is not so much brown pith as I feared to find, and this is always encouraging for the ensuing season.

A. PIPER.

VIRGINIAN COWSLIPS.

Mertensia virginica is one of our best late spring-flowering plants, and is perfectly hardy. It succeeds in the drier parts of the bog garden, or in half-shady nooks among choice hardy ferns, where its relative beauty is greatest on account of the neutral setting of the fern fronds. The flowers of this mertensia are produced in terminal clusters, the stems arch gracefully, and the individual flowers are cup-shaped, having the segments united and contracted for the greater part of their length into a narrow tube. The colour passes from purple into a fine shade of blue, but in each head all stages of the transition are noticeable at one and the same time; the leaves are broad, oval-lanceolate in form, and diminishing in size as they ascend the flower stem, which varies in height from eighteen to twenty-four inches.

Another fine species is M. sibirica, with flowers varying from pink to porcelain-blue. The stems arch over, and the flower heads fork into short racemes; the leaves are somewhat fleshy, and appear as if coated with a dull blue-grey bloom. M. sibirica grows to a height of eighteen inches, and continues in flower from May till early autumn.

M. primuloides is a dwarf species with bright blue flowers having a distinct yellow eye; it only grows six inches high, and is most suitable for a choice position on the rock garden. It is a good grower when planted in a level part in peat and loam, and lightly shaded from the midday sun.

THOMAS SMITH.

Walmsgate Gardens.

Small Borders for Peaches.—Being very interested in the cultivation of peaches, I read with much interest Mr. Geo. Garner's article on the subject of "Small Borders," and with it I entirely agree. The best house of peaches I ever had was one with a small border. But my neighbour, who had a small three-quarter span greenhouse, with a small border behind a cement path, which could not have been more than eighteen or twenty inches wide, with about the same depth, planted two peach trees therein, and the result was surprising. The trees grew well, soon reached the top, and he trained them to the wires over the path. The last time I saw them they had nearly covered the whole house, and he has never failed to secure a good crop of fruits. I was much struck by the health of the trees, especially as they were growing in an ordinary greenhouse, and showed what can be done in a small border.—C. ENGLISH, New Place Gardens.

METHODS OF EXHIBITING DAHLIAS.

The following original paper, dealing drastically with methods of exhibiting dahlias, was contributed by Mr. J. B. Riding at the dahlia conference recently held by the National Dahlia Society:—

I may mention at the outset that the subject of this paper is not of my own choosing, but it strikes one as being like a biblical text, around which a hundred sermons can be preached, so I propose accepting it under similar conditions and taking my own course.

First of all, I propose alluding to the history of exhibiting dahlias, which, so far as this society is concerned, commenced in the year 1858. I have, through the kindness of Mr. Arthur Turner, a copy of the first schedule issued for September 23 and 24, 1858.

The first show was held in St. James's Hall, when eleven classes were arranged for competition. You will readily understand that at that early date the exhibitors had only show and fancy varieties to deal with, even the pompons were not in existence, much less the cactus, pompon cactus, single, giant, collarette, and paeony-flowered sections.

One can imagine the spectacular effect of such a show, with its long lines of boards, without anything to relieve the monotony of the display. One can well understand, however, that the promoters of our first National Show would be perfectly satisfied with such an exhibition, for most things in the early Victorian period were devoid of taste and refinement, at least such as is recognised now; but what is still more surprising to me, is to find that the exhibitors of to-day and the framers of our schedules, have not deviated one iota in their methods of exhibiting since the year 1858; we still have the long lines of show and fancy blooms at our exhibitions, and staged in similar boxes of the same dimensions. Can we recall any other National Horticultural Society in Great Britain which has been content with the same old ways and the same old methods for over 40 years, with the exception of the National Dahlia Society? I think not—at least, I am not acquainted with any. Small wonder then that the show and fancy dahlias have been under a shadow or cloud for many years. To my mind it is nothing short of marvellous that they have not dropped into obscurity years ago. Why? Simply because the public only sees them at the flower shows, and then under such barbarous conditions that they do not even stop to admire them, much less grow them.

The present method of exhibiting show and fancy dahlias is a relic of early Victorian times, and appeals to no one in these days, except, perhaps, a few keen exhibitors, and I feel sure they would welcome a change, too. Small wonder the general public take such little interest in this section, for who, except a dahlia fancier, can see any beauty in rows of coloured drumheads, for as such they must be regarded by all flower-lovers. Why on earth should we cultivate beautiful flowers with fine, handsome stems, then deliberately almost decapitate them, leaving about six inches of stem, which is drawn through a tube, which tube is then corked up and the blooms in this fixture dumped on show boards at six inches apart like rows of soldiers? Surely we should be past such practices in the twentieth century, but really I find we make no attempt whatever to popularise the double or show flowers, for beyond those methods I have described, we do not see them displayed in any other way at our dahlia shows; in fact, we are worse in this respect than our ancestors, for in the schedule I have referred to there is a class for the best ornamental group of cut dahlias, artistically arranged. Surely, if such exhibits could be arranged in 1858, they could be managed in 1910.

I know it will be pointed out that such a stiff, formal flower does not lend itself to decorative effect, but the same might be said of the huge sunflower, the incurved

chrysanthemum, and other flowers of a similar type; but do we find it so? Certainly not.

As far as the incurved chrysanthemum is concerned, it is becoming more liked for decorative work each season. I personally am quite convinced that the show or double forms will again become popular, if we can only show them to the public in a more natural and artistic way; but while we exhibit them as at present, it is impossible for them to rise again.

It will be a glorious day for the show dahlia when we do away with the timber and ironmongery departments at our shows. I would suggest that after our second show this year, to be held at the Royal Botanic Gardens, it would be a fine advertisement for the National Dahlia Society, and the flower itself, if we made a huge bonfire on the rubbish heap of that establishment of the boards and boxes which have been such a curse to this beautiful flower. Naturally, you ask what would you exhibit in? I reply, equally naturally, why, in vases, of course! Now I know perfectly well the objections that will be raised; the first, that it would be impossible to judge them under such conditions, but that objection is as dead as Queen Anne; we have heard it in connection with other flowers, and know its value. Take chrysanthemums and roses as examples. Are not these staged in vases? Yes, and judged, too; so there is an end to this objection. Then, again, the exhibitor will tell you it is impossible to exhibit forty-eight varieties in one class; and a good thing, too, say I.

Twelve varieties of five or six blooms of each, arranged in vases, would be infinitely more effective and pleasing. Objection No. 3 would also come from exhibitors, viz., the difficulty of carrying their blooms on long stems to the shows. This I grant you is a genuine objection, but it is one of those difficulties that have to be overcome, and while other flowers are taken to shows with long stems, there is no reason why the double dahlia should not be treated likewise, especially as the cactus varieties now figure in this form. Other objections are: The time taken in staging at the show; the cost of vases to a society; and no doubt many others; but I think I have said quite enough to convince you that it is high time we had a different method of staging the show varieties.

Now I come to the pompon section. These pretty little flowers are now very popular, and deservedly so, but I doubt very much whether our present method of exhibiting them is the best that could be devised. Gridirons occupy their proper place in the kitchen department of every household, but surely it was an evil day when some of our leading exhibitors conceived the idea of adopting a modification of a culinary article in which to strangle the popular little pompon. No doubt exhibitors have heaped loads of blessings on the head of the inventor, but I am under the impression these blessings have not been universal. Take the case of the amateur, with ten blooms, and ten only of one variety; he has with much patience and care effectually secured number nine; but number ten refused to take the wire properly, and, as in the case of most persons who are hanged, it suffers from a broken neck. I shall not trouble you with the language used on such occasions.

The only justification for using such unnatural appliances is that the work of making up can be done at home, and consequently takes up little time on the day of the show, but like the show boxes, these flat-faced specimens of the ironmongers' and tinkers' art will have to depart from our shows if the pompon is to take up the position it rightly deserves in the rank of popular flowers, for it gives quite a wrong impression of the natural beauty of the flowers. Anything more stiff and formal could not be imagined. The formality is anything but natural, and does not tend to place this pretty little section in its proper sphere.

Now we come to the cactus section: it has been said with a certain amount of truth that the advent of the cactus varieties saved the dahlia from falling into oblivion; at all events its development has largely been responsible for the increased popularity of the flower to-day. How far this development will continue does not come within the scope of my paper, though I may be permitted to say that the cactus varieties became popular because they had lost the formality and stiffness of the older types, they were more in accord with people's ideas of taste and refinement, and last, but not least, they have been staged in a manner more pleasing to the general public.

I need hardly point out the usual method of staging, for you know they are exhibited in wire frames in threes or sixes, according to the schedule. For my part, I should bar every wire frame from a show, simply and solely because they are so unnatural, and because I am convinced the flowers can be staged without them; in fact, you will remember we have already classes where the flowers are staged in vases without wiring or facing, and they are such an object-lesson that I trust the time will come when this type of exhibiting will be the only one seen at our shows.

I fully recognise that it would be impossible to do without wiring for some few years, for some of our most beautiful cactus flowers have such horrible apologies for stems, that if they had to be staged without artificial support they would present a sorry figure. Neither do I see any great objection to such wires, provided they are not made up into stiff frames with the flowers facing all one way, like a squad of soldiers.

The general tendency at all shows now is to produce a natural exhibit, and I cannot call to mind any other flower that suffers such indignity—except perhaps the viola, and this as a sprayed flower is fast disappearing. Those of you, who bear in mind the splendid exhibits of Messrs. Cheal and Sons, Mr. Seale and Mr. Treseder, in the vase classes, and again in the baskets, which were most beautiful and natural, will remember these were more generally admired by the public than any other section of the show; in short, these represent my idea of the best method of exhibiting the cactus dahlia. I know it is far more difficult for the exhibitor, because he requires a quantity of beautiful foliage, which is not easily obtainable, and it takes far longer to arrange at the show, but exhibiting of every kind has advanced so much during the past ten years that an exhibitor's machinery has become as important as his flowers; by machinery I mean his foliage, supports and assistants.

The trade exhibitors of dahlias, who utilise bamboos, vases, etc., with an appropriate setting of foliage, grasses, ferns, and plants, produce a far finer effect than is seen in our artificial competitive classes, and it is upon these lines that we should proceed if we want to bring our exhibition up-to-date. Why should the dahlia world lag behind and be content to stage its blooms in the same old way, when the rest of the horticultural world is forging ahead? As an instance, rock and alpine plants used to be arranged in vases at shows: now such a procedure is quite out-of-date, and never seen, for a far more natural form of displaying their beauties is in vogue, and the same might be said of many other flowers.

It is only necessary to mention the other sections of dahlias, for the remarks I have made are equally applicable to them.

The single, giant, decorative, paeony-flowered, and the collarette forms, can all be arranged in vases, and in every case their decorative effect should be kept in mind, for it behoves a committee to remember that the crowd at a dahlia show consists of one fancier to ninety-nine people who do not see the points of beauty that the fancier is looking for, but who recognise and appreciate a beautiful floral display; and if this were provided, I feel sure our dahlia exhibitions would be more popular than they are to-day.

In conclusion I must draw attention to the naming and labelling of varieties, because I think I am justified in doing so by the title of my paper. I have been present at the majority of exhibitions held in London for the past twenty years, and I say that the method of labelling and the slipshod fashion in which it is carried out is only excelled by one other National Society. Surely this should be altered. As far as cards are concerned, they are cheap enough in all conscience; yet what do we see? Long strips of paper, somewhat related to lining paper for walls, with four dozen names written off in four lines, often with lead pencil, a perfect puzzle to the general public, and when the paper slips a little, confusion is worse confounded. Why should this be allowed? It should be insisted upon that each variety should be clearly and legibly named, which is more than is done at the present time.

I see in the year 1858 cards were provided for this purpose by the society, and it would be a good thing if it were carried out now. At all events, let us do away with the state of things as it exists to-day. If I can only shame some of the exhibitors into taking more care and interest in this matter, I shall feel fully satisfied in having called attention to a matter which is highly educational, and for the good of the flower itself.

GESNERA ZEBRINA.

I, too, was very much interested in the timely references to Gesnera Royal Orange in the Gardeners' Magazine of February 12, which were so reminiscent of my acquaintance with G. zebrina upwards of sixty years ago, during my probationary career in horticulture under my father. I believe that he procured G. zebrina from Messrs. Knight and Perry, of Chelsea, soon after its introduction from Brazil in 1840. He cultivated it with great success as a late autumn and winter-flowering plant.

I have a vivid recollection of its enchanting appearance and its bright scarlet-yellow panicles of flowers, and the rich, mottled, dark green, velvety foliage—attractions which are not usually combined in the same plant. Grown either as a mass from 18in. to 24in. across, to furnish large vases, or as single specimens for the dinner-table or flower-stands, it is unsurpassable for effect, and the wonder is that its cultivation at the present time should be so little recognised, especially, too, considering its easy cultivation. Possibly the introduction of the numerous garden hybrids which have been evolved is partly responsible for the comparative neglect of the exquisite G. zebrina.

Beautiful compeers of the latter are: G. Exoniensis, with its richly-coloured and velvety foliage (a hybrid from G. zebrina and G. refulgens); G. Herbertii, G. cinnabarina, G. Cooperii, G. gloxiniæflora, and G. zebrina splendens. A valuable feature in the newcomer—i.e., G. Royal Orange—appears to be its comparative hardiness, as it requires only a medium temperature. It would have been additionally instructive had the colour of its foliage been described in connection with the excellent illustration and cultural details given on page 127.

Birmingham. William Gardiner.

Cauliflowers.—Where sturdy autumn-sown plants have been well hardened off in cold frames they can in many districts be planted out now with safety. Choose a sheltered site, preferably one with a southern aspect. If severe winds occur protect with yew or spruce boughs, as this secures strong and quick growth. Those growing in pots intended to "head" therein should have a top-dressing of equal parts of loam and decayed manure; give occasional applications of liquid manure, and keep the plants on in a house near the glass. The small-headed varieties advised to be sown in January are now being planted thickly in both warm and cold frames between the late or spring endive, the latter being taken up later and conveyed to the mushroom house, and the space provided is then sown with turnips, beet, etc.—G. Ellwood.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

THE CATTLEYA HOUSE.—The plants in this division will now be in more or less active growth, either developing roots or producing their flowers. Those that are producing new roots from the base of the last made pseudo-bulbs should be repotted if necessary before the new roots become far advanced, as there is considerable risk of danger if the points of the roots are injured. We find a compost of peat, broken finely, leaves, osmunda fibre, and chopped sphagnum a suitable one, with sufficient broken crocks and silver sand added to render the whole porous. All newly-potted plants should be carefully protected from bright sunlight until the new roots have become established in the fresh compost. Supply with tepid rain water as soon as potting is completed, but only sufficient root moisture should be given afterwards to keep the plants plump. It is a good plan to spray fresh-potted plants overhead once or twice a day, as this will very considerably assist them to retain their normal plump condition. Plants that are producing their new growths should not be hurried. It is far more desirable that they should be retarded for a few weeks, so that they may then be afforded the full advantage of the more favourable outside conditions. There can be no doubt but that there is a great deal to be gained where such species as C. Warscewiczi (gigas) and C. Dowiana aurea can be retarded, and exposed to a reasonable amount of light. Under this treatment the most shy-flowering varieties of the former species are induced to flower, and there is also less danger of the plants commencing secondary growths after flowering.

LATE SPRING AND SUMMER-FLOWERING SPECIES and hybrids will have their flowers advancing through the sheath, and such must have every encouragement to assist the development of the flower buds, and the expanding of their flowers. To bring out the best colour in the flowers of this showy class of plants good light must be allowed; this will have considerable effect, but it should not be forgotten that, while strong light will assist plants to gain colour before they expand, it has also the effect of bleaching the colours out in expanded flowers, hence the open blooms must be shaded. It frequently happens at this season of the year, when the atmosphere becomes heavily charged with moisture, that some of the plants collect a considerable amount of water inside the flower sheath. In some cases this may be noticed by the transparent appearance of the sheath; in others the sheath begins to discolour. In any case, if it is desirable to save the flowers, it is a good plan to sever the sheath about half-way down, or as low as the flower buds will permit; the sheath should then be opened with the blade of the knife, which will permit the moisture to escape, and thus save the flower buds from decay.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

AIRING AND SHADING.—Now that the days are lengthening and the sun beginning to gain power, the blinds should be examined and fixed ready for use. Not that they will be necessary yet for crotons, dracænas, gardenias, ixoras, etc., but at the same time some of the more tender foliage plants, such as caladiums, alocasias, etc., ferns, and seedling plants of many kinds may with advantage receive a little shade during the hottest part of the day. Where roller blinds are not ready thin tiffany tacked to battens will answer the same purpose. Do not evade this matter of shading, for the more the shading is used the more tender the plants become, and consequently are more liable to scorch if by chance the blinds are not let down early. Much ventilation will not be necessary for awhile, as the majority of the plants have not recovered from the check of potting, but a little air should be admitted a few hours daily, as in a close, stuffy atmosphere the surface of the soil, as well as the pots, soon become green, which is not an advantage by any means. An overhead syringing may be given, both in the morning and afternoon, on all bright days, though in the afternoon it should be done early enough for the foliage to become dry before evening. As the forced plants are worked out of some of the warmer houses they will make room for gloxinias, begonias, streptocarpus, etc., though, of course, these two latter will gradually be inured to a greenhouse temperature.

ACALYPHAS.—These are among the most easily-grown of stove plants, and for many purposes are very useful. A. musaica and A. marginata are in demand for filling small vases on the dinner table, and jardinieres in the house, so that a batch of these should be raised whenever there is room for them. Acalypha hispida is also a very graceful plant, and is seen to best advantage when grown in baskets suspended from the roof; for this purpose strong rooted cuttings should be selected, placing one or three in a basket, according to its size, and if they are put in before the young plants become pot-bound it is surprising how quickly and how much more strongly they grow than when grown in pots. Place the baskets where they will have plenty of light without much strong sun, and as soon as the tassels of bloom begin to push out keep the syringe from them, and they will keep in good colour for months. The foliage will require an occasional sponging to keep down spider, which is somewhat of a pest to this plant.

ANTHURIUMS AND ALOCASIAS.—These are amongst the finest of all stove plants, the former being prized for their spathes, as well as for their noble foliage, while the latter are grown entirely for their foliage, which in many kinds is strikingly handsome. If these plants were not attended to during the general potting, no time should be lost in putting them in order. Where repotting is necessary this must be carefully done. For large plants pans are preferable to pots, and these should be crocked quite two-thirds of their depth, and the potting compost should consist of a mixture of very fibrous loam, peat, leaf-soil, charcoal, broken crocks, silver sand, and sphagnum moss. Pot as firmly as this compost will allow, and if the plants are at all unsteady after potting, a few stakes should be put to the principal leaves to steady them until the roots are running freely in the new compost, which will not take long, providing a very humid atmosphere and a high temperature is kept up. Shading is very essential, particularly after repotting. If an increase of stock is necessary, this may be provided by division of the rhizomes in the case of alocasias, or of the crowns in the case of anthuriums, but large plants are much to be preferred to a number of small ones. — THOMAS STEVENSON, Woburn Place Gardens.

FRUITS UNDER GLASS.

EARLY VINES IN POTS. — If high quality in the fruit is preferred to quantity the vines must not be very heavily cropped, but, under good management, the leaves will be kept healthy, and each vine should perfect seven or eight ordinary-sized bunches. During the time the fruit is swelling, a temperature from fire-heat of 65 deg. at night, and 70 to 75 deg. by day will suffice, but advantage should be taken of bright days to raise the figures to 85, or 90 deg., and at such times carefully admit air from the top ventilators early in the day, but avoid cold draughts, and close the ventilators again when the sun's heat begins to wane, at which time damp all available surfaces inside the house. The maintenance of a moist atmosphere will both greatly assist the vines and discourage attacks of red spider, but should this insect appear, check it at once by sponging the leaves with soapy soft water. Regularly stop lateral growths, and pay close attention to watering and nourishing the plants with diluted liquid manure, or top-dressings of suitable soluble fertilisers.

SUCCESSIONAL VINES. — Black Hamburgh, Madresfield Court, Foster's Seedling, and similar varieties should, while in blossom, be afforded a night temperature of 65 to 70 deg., with the usual rises by day; the atmopshere, by discreet attention to ventilation, and moisture must be maintained in a buoyant and tolerably dry state, and other usually adopted means be also taken to insure a good "set" of fruit. As soon as the fruit has set, the bunches should be thinned, leaving the required number of the best to furnish the crop, but the weight of crop should be governed by the vigour of the vines and the available means of feeding them. Keep sub-laterals stopped at one leaf, and as soon as the laterals have become firm finally bring them down and secure them to the trellis. Commence the thinning of the berries upon such free-setting varieties as the Black Hamburgh as soon as it can be ascertained which berries have taken a decided lead, and, in doing so, endeavour to leave sufficient of the best placed of these to form perfect bunches.

EARLY FIGS IN POTS.—As soon as the fruit now nearing its final swelling on the earliest trees shows signs of ripening, the ventilation of the house should be judiciously increased, and the atmospheric moisture lessened, but the fire-heat should be sufficient to uphold a night temperature of 65 deg., and 5 or 10 deg. more by day, otherwise the prospects of a good second crop will be impaired; for the same reason the leaves should be kept clean. The quality of the fruit will be improved by free exposure to air and sun, which may be enhanced by the stopping and thinning of shoots. When ripening, keep the fruit dry.

SUCCESSIONAL FIGS IN BORDERS.—If disbudding has not been adequately done to prevent crowding, rectify the evil by thinning-out the weakest shoots, and at the same time thin the fruits of overburdened trees. Stop the remaining shoots at the fifth leaf in order to assist them to develop a good second crop. Well syringe the trees, and admit a little air in the early morning of sunny days, increasing this as the sun gains power, but entrap the sun heat by closing early, at which time syringe the trees and damp their surroundings. Heavily-cropped trees, with their borders filled with roots, will require, apart from manurial mulchings, liberal supplies of liquid manure, and occasional top-dressings of artificial compounds.—T. COOMBER, The Hendre Gardens.

THE KITCHEN GARDEN.

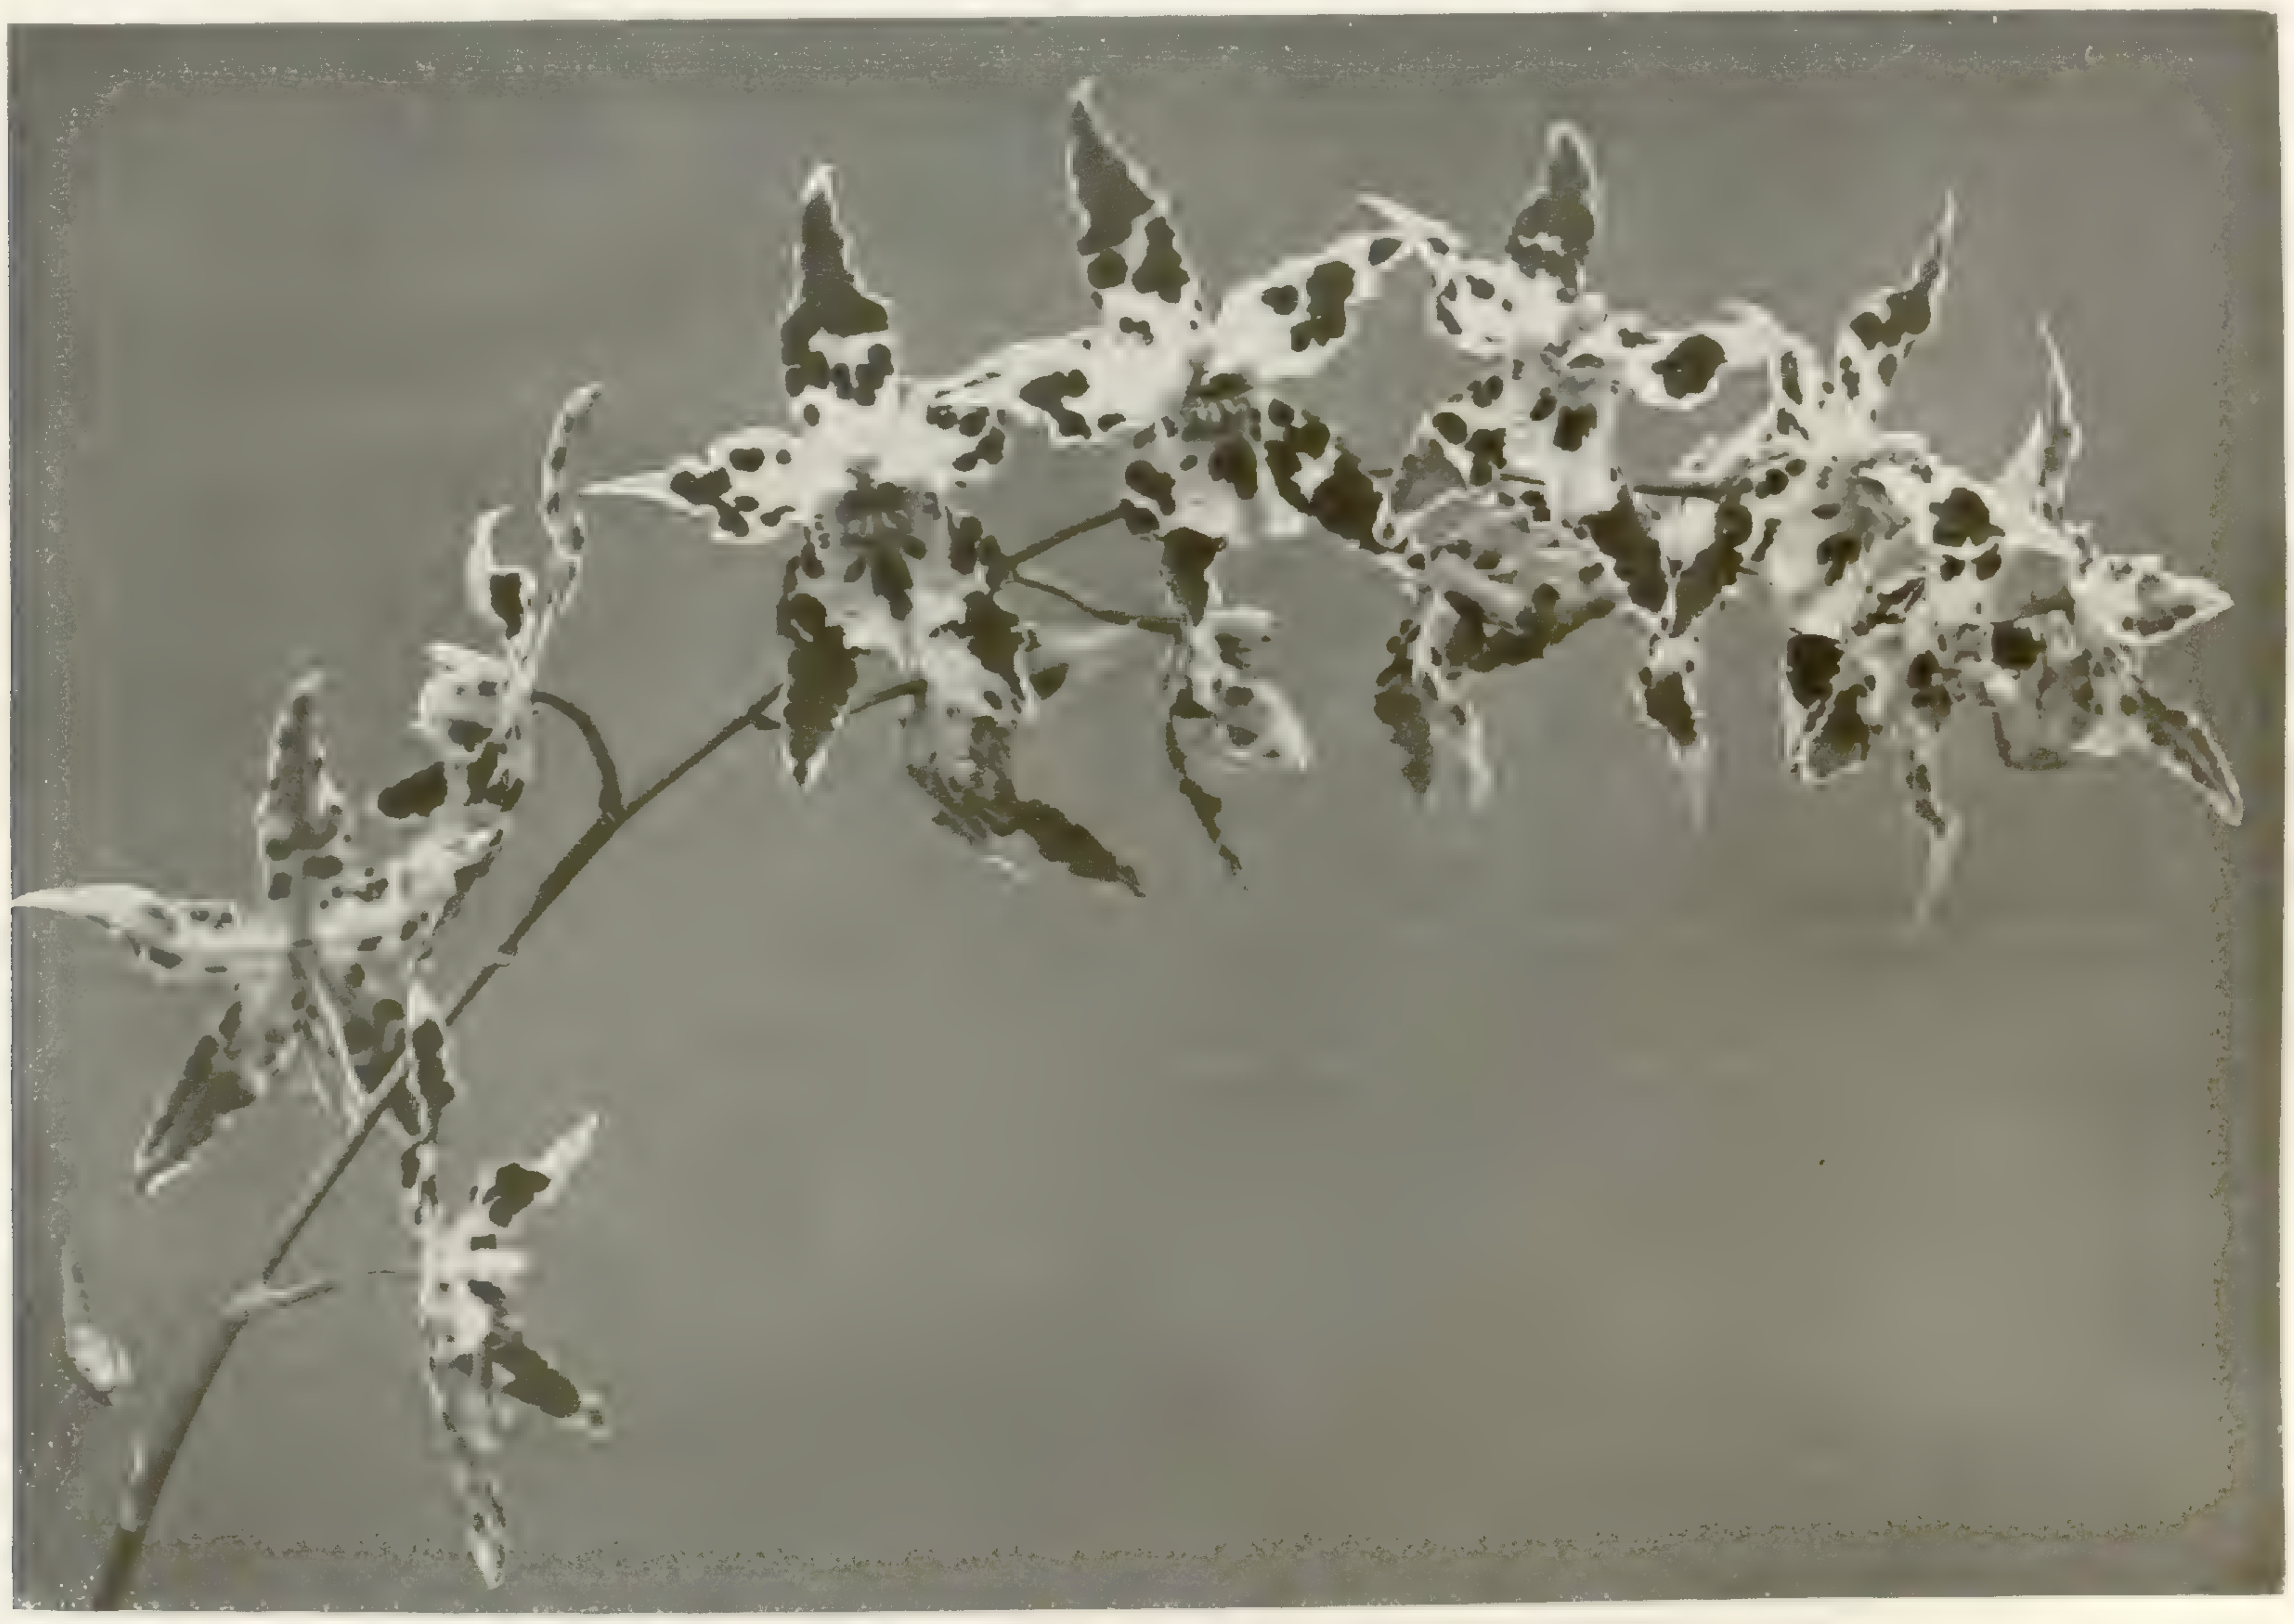
CARROTS.—The main sowing should now be made in a quarter which has been specially prepared for this crop; great pains should have been taken in the preparation of the soil by trenching and adding soot, road scrapings, fine leaf-soil, and mortar dust, if available, as this is perhaps the most uncertain of all kitchen garden crops on many soils. Previous to sowing the bed should be brought to a fine dry tilth, scattering burnt garden refuse, old potting soil, soot, and lime plentifully over the surface: fork well in, and bring the surface into a fine state. Rake level, and draw shallow drills at one foot apart. For exhibition specimens holes must be bored with an iron bar three feet deep, at fifteen inches apart, and these filled with four parts sandy soil, one part burnt wood ashes, road sand, and a quart of bonemeal to a good barrowful of the mixture. Good strains of Intermediate are unsurpassed for exhibition purposes. For shallow soils, Early Gem, Favourite, and Model are excellent stump-rooted kinds. Carrots growing in frames must be thinned as required, and given an occasional dusting of soot; give regularly sprayings, and just sufficient air to prevent them becoming weak and drawn.

PEAS.—It will now be safe to sow in the open quarters good supplies of the more tender marrowfat varieties. Trenches are preferable, adding well-decayed manure and burnt garden refuse in their preparation. When finished the trench should be three inches below the general level. It will be found the plants will yield a healthy and more bounteous crop, and over a longer period if this little extra care is taken.

OUTDOOR TOMATOES.—To procure good plants for putting out in the open by the end of May, a sowing must be made at once. Sow the seeds in boxes filled with sandy soil, cover with very fine soil, and place in a temperature of 55 degrees. When two rough leaves are developed put them singly in four-inch pots, using three parts loam, one part leaf-soil, one part spent mushroom bed manure, and a little mortar rubble or sand. Keep them in a similar temperature until well established, and then harden them carefully in a cold frame. In choosing a site for these select a south wall or fence. The mistake most often made with outdoor tomatoes is that the soil is too rich, and far too deep. Excellent results can be obtained if the plants are placed on an ash or cinder base, and rammed very firmly, placing just enough chopped loam, in heaps, to receive each plant. It will be found the sun will thoroughly warm the heaps, and that light top-dressings will soon be needed, while stocky, fruitful growths will result. When four trusses of bloom show, top-dress with horse manure, and water as required.

FRENCH BEANS.—Make a plentiful sowing in pots of the variety Canadian Wonder, as this succeeds the earlier forcing kinds. If sown two or three seeds in 60-sized pots they can later be planted out in pits or frames as can be spared for them. Maintain a constant supply in the bean house, and ply the syringe very forcibly and freely among the plants to keep red spider at bay.

HOEING.—This very important work must be carried out constantly among all growing crops whenever the ground is in working order. Plots that are lying rough, awaiting potatoes, cauliflowers, and other subjects, should be again turned over, so that the ground is brought into a high state of fertility by exposure to the atmosphere.—Geo. Ellwood, Swanmore Park Gardens.



ODONTOGLOSSUM GLADYS VAR. H. W. CHEAL.

A.M., R.H.S., March 22, Messrs. J. and A. McBean, Cooksbridge. Flowers white, heavily marked with chocolate-red, with a yellow lip.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The Royal Horticultural Hall was well filled with exhibits on March 22, but was not so packed as at the previous meeting. Some of the displays were of special interest, but many were a long way below the standard that ought to be maintained at the "fortnightlies." Exhibitors imitate each other too closely in the design and contents of their groups, and rarely show in any new or distinct manner. Daffodils, orchids, early vegetables, roses, carnations, and forced shrubs were the leading features of the show. The new direction boards indicating how visitors should begin, continue, and end their tour, caused a good deal of amusement, and "Start here" and "Finish here" suggested athletic sports or a race meeting rather than a flower show. The directions were chiefly honoured in the breach, but as there was no crush, as on March 8, there was no inconvenience.

FLORAL COMMITTEE.

Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, brought up the elegant Calathea crocata (A.M.), a maranta-like plant with neat spikes of bright orange-yellow coloured bracts and small yellow flowers nestling in pairs at the base of the bracts. A showy and interesting plant. Mr. J. Edney, gardener to Mrs. Bischoffsheim, Warren House, Stanmore, brought forward a finely-grown lot of pot roses, the leading varieties being Frau Karl Druschki, Richmond, Mrs. J. Laing, and La France. Vases of lovely roses were also shown by Messrs. R. F. Felton and Sons, Hanover Square, who put up exquisite flowers of Mdme. Abel Chatenay, Mdme. Melanie Soupert, Mrs. Joseph Lowe, Franz Deegen, and Kaiserin Augusta Victoria.

A delightful exhibit of Primula obconica, well grown, splendidly flowered, and in a fine range of colouring from pure white to bright red-magenta, was made by Messrs. James Veitch and Sons, Lim., Chelsea, who also set up a group of gorgeous amaryllis, fragrant boronias, and elegant cinerarias. The Messrs. Veitch also set up a grand display of forced flowering shrubs, their rhododendrons, including R. primulinum (A.M.), viburnums, wistarias, and Andromeda speciosa cassinæfolia being the chief features. Messrs. William Paul and Son, Waltham Cross, were also exhibitors of forced shrubs in great variety.

Messrs. Paul and Son, Cheshunt had a fine show of flowering trees and shrubs, including excellent specimens of Rhododendron Kewense. Very beautiful were the hardy rhododendrons displayed by Messrs. R. Gill and Sons, Penryn, Cornwall, all cut from the open in Cornwall; the arboreum varieties were superb, and R. Duchess of Cornwall was grand. A magnificent plant of Primula imperialis, with leaves nearly 18 inches long, was a surprise to lovers of primulas.

Mr. R. B. Leech, Woodhall Gardens, Dulwich, had a bright exhibit of anthuriums of the Scherzerianum and Rothschildeanum sections. Messrs. J. Carter and Co., Holborn, were responsible for a rock garden, prettily planted, and with a pool of water. Messrs. Jarman and Co., Chard, displayed cinerarias. The fine Princess of Wales violet, with very long stems and fragrant blooms was well shown by Messrs. S. Bide and Sons, Farnham, Surrey, and the new Lady Hillingdon rose, recently figured in our columns, was again displayed by Messrs. G. Mount and Sons, Canterbury. Mr. G. Prince, Longworth, was also an exhibitor of roses.

The elegant Begonia manicata was largely shown by Messrs. H. Cannell and Sons, Swanley; and Messrs. J. Peed and Son, Norwood, contributed a batch of lachenalias. The fine Cyrtomium Rochfordi, a splendid greenhouse fern, the elegant Nephrolepis lycopodioides, and a few fine examples of Polypodium glaucum crispum were all shown by Messrs. Thomas Rochford and Sons, Broxbourne.

Hardy flowers and forced flowering shrubs were contributed by Messrs. W. Cutbush and Son, Highgate, rhododendrons and Anemone blanda being conspicuous subjects. Messrs. J. Cheal and Sons, Crawley, had a small rockwork display. Messrs. Bakers, Lim., Wolverhampton, had hardy primulas and other alpines. Messrs. Jackman and Son, Woking; and Messrs. T. S. Ware, Lim., Feltham, also had pretty displays in this department.

The boldest group of carnations was Mr. Burnett's, whose Guernsey-grown flowers were of fine size, his Mikado, Marmion, Mrs. H Burnett, and the new R. F. Felton (A.M.) attracting a great deal of attention. Messrs. W. Cutbush and Son had also a display, as did Messrs. Stuart Low and Co., Enfield, who had roses, etc., as well, while Mr. W. H. Page, Tangley Nurseries, Hampton, had magnificent sheaves of fine carnations and liliums.

DAFFODIL COMMITTEE.

Daffodils were shown in large numbers, and there were six groups of these and other bulbs before the Daffodil Committee. Messrs. Cartwright and Goodwin, of Kidderminster, had a very elegant exhibit of good flowers of choice varieties, such as White Lady, Circlet, King Alfred, and Cornelia. Mr. A. Wilson, formerly of Spilsby, and now of Bridgwater, had some lovely new unnamed seedling daffodils, and his vase of Tamariane was greatly admired.

In Messrs. Sutton and Sons' large contribution of tulips, tastefully arranged in groups of a variety, Orange Blossom, La Reve, Coleur Cardinal, and La Remarquable were very fine. Messrs. R. Sydenham, Lim., Birmingham, and Messrs. R. H. Bath, Wisbech, had displays of bulbs grown in moss fibre.

Messrs. Barr and Sons, Covent Garden, displayed both new and popular daffodils, tulips, and alpine flowers;. and Mr. Frank Lilley, Guernsey, sent daffodils and anemones.

ORCHID COMMITTEE.

Orchids were again well shown, and in Messrs. Stuart Low and Co.'s group Odontioda Bradshawæ and Cymbidium insigne were conspicuous among odontoglossums, masdevallias, etc. Brasso-cattleya Mariæ, with delightfully fringed lip, some exquisite odontoglossums, and Odontioda Bradshawæ were conspicuous in Messrs. Charlesworth and Co.'s display. Messrs. Sander and Sons, St. Albans, had a fine lot of odontoglossums and some lovely deep blue spikes of Vanda cœrulea, and the new Houlletia Sanderi (A.M.).

Dendrobium rubens grandiflora and the yellow D. Melpomene were notably good in Messrs. Cypher and Son's group. Lælio-cattleya Trimyra (A.M.), from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), has sulphur-yellow flowers and orange-tinted lip: Sarcochilus Hartmanni and Lycaste Mantini also came from Burford Lodge. Cymbidium insigne was the leading feature of the display by Mr. E. V. Low, Haywards Heath, but the pure white Lycaste Skinneri alba was also fine, and Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Lodge, Reigate, had a number of interesting botanical orchids, and Odontoglossum Thompsonianum Gatton Park var. (A.M.).

Brasso-cattleya The Baron, with large and exquisite blooms, was well shown by Mr. J. Gurney Fowler, Glebelands, Woodford. Among many good things Messrs. J. and A. McBean, Cooksbridge, had a gem in Odontoglossum Gladys var. H. W. Cheal (A.M.), which has white, chocolate-red marked flowers, with a yellow lip—very pretty. Two examples of Cattleya Robert de Wavrin were brought up by Mr. Alexander, orchid grower to Lieut.-Colonel Holford, C.V.O., Westonbirt, Tetbury, but one of these, named Westonbirt var. (F.C.C.) was far ahead of the type in size and colouring; it has lovely soft rose-coloured sepals and petals, and light bluish purple lip with yellow and ruby throat.

FRUIT AND VEGETABLE COMMITTEE.

Early vegetables were finely shown by Messrs. Sutton and Sons, Reading, their Golden Ball lettuces, broccolis, French beans, chicory, Delicacy cucumbers, Duchess of York peas, Harbinger cabbage, and Sutton rhubarb being fine features. Messrs. J. Veitch and Sons contributed early salading and coloured kales, and Veitch's New Sprouting Kale, a prolific variety.

CERTIFICATES AND AWARDS.

First-Class Certificate. — To Cattleya Robert de Wavrin Westonbirt var., from Lieut.-Colonel Holford, C.V.O. (grower, Mr. H. Alexander), Westonbirt, Tetbury.

Award of Merit. — To Odontoglossum Thompsonianum Gatton Park var., from Sir J. Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

To Odontoglossum Gladys var. H. W. Cheal, from Messrs. J. and A. McBean, Cooksbridge.

To Houlletia Sanderi, from Messrs. Sander and Sons, St. Albans.

To Lælio-cattleya Trimyra, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

To Rhododendron primulinum, from Messrs. James Veitch and Sons, Chelsea.

To Calathea crocata, from Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

To Carnation R. F. Felton, from Mr. H. Burnett, Guernsey.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for flowering shrubs, primulas, amaryllis, etc.

Silver-Gilt Flora.—To Mr. W. H. Page, Hampton, for lilies and carnations; to Messrs. W. Cutbush and Son, Highgate, for carnations and hardy flowers; and to Messrs. T. Rochford and Sons, Broxbourne, for ferns and roses.

Silver-Gilt Banksian.—To Messrs. R. and G. Cuthbert, Southgate, for azaleas, etc.; to Messrs. S. Low and Co., Enfield, for carnations, roses, etc.; to Mr. L. R. Russell, Richmond, for flowering shrubs; to Messrs. Cartwright and Goodwin, Kidderminster, for daffodils.

Silver Flora.—To Messrs. Sutton and Sons, Reading, for tulips; to Mr. A. Wilson, Shovel, Bridgwater, for daffodils; to Mr. Edney, gardener to Mrs. Bischoffsheim, Warren House, Stanmore, for pot roses; to Mr. H. Burnett, Guernsey, for carnations; to Mr. R. B. Leech, Woodhall, Dulwich, for anthuriums; to Messrs. H. B. May and Sons, Edmonton, for ferns and clematises; to Messrs. G. Mount and Sons, Canterbury, for roses; to Mr. A. Speer, Esher, for flower paintings; to Messrs. Jas. Carter and Co., Holborn, for rock garden; to Messrs. R. Felton and Son, Hanover Square, for roses; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids.

Silver Banksian.—To Messrs. G. and A. Clarke, Dover, for hardy flowers; to Mr. Galsworthy, Chertsey, for flower pictures; to Messrs. R. Gill and Sons, Penryn, for rhododendrons; to Messrs. G. Jackman and Son, Woking, for hardy flowers; to Messrs. Paul and Son, Cheshunt, for rhododendrons; to Messrs. Wm. Paul and Son, Waltham Cross, for camellias, etc.; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; to Messrs. Barr and Sons, Covent Garden, for hardy flowers, and also one for daffodils; to Messrs. J. and A. McBean, Cooksbridge, for orchids; and to Mr. A. W. Jensen, Lindfield, for orchids.

SCIENTIFIC COMMITTEE, MARCH 8.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Professor Sir A. Church, Messrs. J. T. Bennett-Poë, F. J. Baker, W. Hales, R. H. Pearson, H. J. Veitch, A. W. Hill, J. S. Arkwright, L. H. Crawshay, J. Douglas, W. Fawcett, J. Fraser, A. D. Michael, Dr. J. A. Voelcker, and F. J. Chittenden (hon. secretary).

SCALE ON ALDER.—Mr. R. Newstead, A.L.S., reported that the scale insect on the stem of alder shown from Mr. Lynch at the last meeting was Aspidiotus salicis.

FUNGUS ON SAXIFRAGA.—Mr. Chittenden reported that he had examined the Saxifraga longifolia sent to the last meeting by Mr. Farrer, and found it to be attacked by the rust fungus, Puccinia saxifragæ. This fungus attacks several species of saxifrage, but appears to be rather uncommon in Britain.

HYACINTH BULBS FAILING. — Mr. Michael reported that he had failed to find any bulb mites on the hyacinth bulbs submitted to him at the last meeting, and thought the death of the roots had, in all probability, been caused by excess of moisture at the roots soon after they had been formed.

MALFORMED CYPRIPEDIUMS. — Mr. L. H. de B. Crawshay showed drawings illustrating the malformations shown in the twin-flowered inflorescence of Cypripedium barbatum from the Lord Avebury exhibited at the last meeting. He remarked that the two-flowered scape had branched about the middle. The terminal flower had a complete perianth except the labellum, which was absent, its only indication being a median streak in the anterior sepal. The column was formed of two normal anthers and two staminodes, the stigmatic plate being absent and its place occupied by the anterior staminode. The ovary contained two placenta placed opposite to one another. The lateral flower is normal in every way, except in the trimerous outer whorl of the perianth, which shows reversion to the primitive type, the three segments being divided to the base. The ovary contained only one placenta, placed anteriorly.

PIGMENTS IN BEAN SEEDS.—Mr. E. A. Bunyard has examined the pigments in the seeds of the beans shown at a recent meeting, and writes that they exhibited seven distinct tints of brown, two shades of green, one black, and one blue-black. All the tints of brown are due to one pigment.

It is insoluble in carbon bisulphide, water, alcohol, ether, acids, and alum, but soluble in an aqueous solution of ammonia. A flocculent precipitate is thrown down from this solution by acetate of lead, and a strong black colour formed when treated with ferrous sulphate.

It seems probable therefore that the pigment is a tannin, but the small amount of material renders it impossible to affirm this with any accuracy. It is apparent that they are merely quantitative differences of the same pigment. The beans are referred to under numbers, as No. 1, etc.; the colours (Code des Coleurs) as C 100, etc.

Bean No. 1 is, for instance, a near approach to C. 107, and the pigment, in a state of purity, would probably be between the "standard colours" Nos. C. 101 and 126.

Nos. 9, 6, 3, are closely matched by C. 107, 113, 143 respectively, and the parent beans show the pigment much diluted in C. 128 D.

No. 8 has, however, a distinct green tinge. In this, microscopical examination reveals the pigment in a finely-granulated condition, which causes, of course, greater light absorption than when in a liquid or semi-liquid condition. C. 167 gives this tint well.

No. 2 might at first be considered black, but a careful examination reveals its greenish hue, due to a large amount of the same pigment, also very finely granulated. No. 11, an apparent black, reveals the same condition. The colour in these two cases is soluble in ammonia, and gives a solution identical with that extracted from No. 1.

The only other case I have met where a yellow pigment strongly concentrated gives an appearance of black, is the case of Cœlogyne pandurata, in which the black lines are formed of highly-concentrated yellow pigment.

The case of Nos. 8, 2, and 11, in which the pigment is much granulated, is paralleled by the dark chocolate varieties of sweet peas. In these the anthocyan sap is deposited in dense granules instead of being in liquid form, and the very dark shades are thus produced.

No. 10 is of a blue-black tint, not represented in the code, and is due to a strong concentration of an anthocyan pigment. The well-known dwarf bean Negro Largo is coloured with the same pigment. The limited material made it impossible to ascertain in which division of the anthocyans it should be placed.

WOOD ALLEGED TO PREVENT IRON RUSTING.—Mr. E. M. Holmes reported that he had examined the wood shown at the last meeting by Dr. Voelcker, and found it to be from a coniferous tree, which Mr. Herbert Stone, F.L.S., suggested might be an agathis; he had not seen it before, however. Mr. Holmes could suggest no reason why a decoction of the wood should prevent rusting. It appears to contain resin, but that is insoluble in water. It is certainly not the wood of Machilus Thunbergi, as has been suggested, for that belongs to the lauraceæ.

LILACS SPORTING.—Messrs. Paul showed a white-flowered lilac with two bunches of lilac flowers and one bunch of white at the end of one of the branches, affording a somewhat remarkable case of a white flower sporting to lilac.

GNAURS ON BEECH.—Mr. W. Fawcett, F.L.S., showed a branch of a beech from Tunbridge Wells having several large, smooth swellings upon it. A section through one of them showed that the middle portions were quite dark brown, and there were dark streaks also in the wood. No fungus mycelium, however, could be discovered. It was suggested that the specimen should be referred to Dr. Henry.

SUCKERS ON PLUMS, ETC.—Mr. J. Fraser, F.L.S., showed specimens illustrating the development of suckers on plum roots. He pointed cut that the first sign of a sucker appearing is a swelling on the root. On this swelling, scale leaves, rather thick in texture, arise, and later the little bud develops into a shoot. He suggested that, in order to avoid the development of suckers, seedling plums should be used for budding, and not suckers.

FASCIATED ASPARAGUS.—Mr. J. S. Arkwright showed a remarkable specimen of fasciated asparagus measuring about two inches across, and somewhat spirally twisted. Fasciation is common in this plant, but it is seldom that such a large specimen is sent to the committee.

SEEDLINGS FROM AMARYLLIS.—Mr. J. Hudson showed two seedlings from an amaryllis which had been pollinated with pollen from Vallota purpurea, having flowered in the autumn. They did not show in any essential point the characters of vallota, and it was suggested that the flowers should be self-pollinated and seedlings raised from them, to see whether the next generation showed any segregation in the direction of vallota.

National Chrysanthemum Society.

On Monday evening last the Executive Committee held a meeting at Carr's Restaurant, Strand. Mr. T. Bevan in the chair. The St. Peter's Chrysanthemum Society and the Lytham Gardeners' Association were admitted in affiliation. The Secretary then submitted the usual financial statement, showing a balance in hand. Arrangements have been entered into with the Crystal Palace Company for the holding of two shows in 1910, the first to be on October 5 and 6, and the second on November 2, 3, and 4. The secretary was empowered to make all final arrangements and sign the contract on behalf of the society. To replace the members retiring by rotation from the Floral Committee, the following gentlemen were elected:—Messrs. D. B. Crane, W. Howe, J. H. Witty, H. J. Jones, D. Ingamells, and Ladds. The members of the Finance, Schedule, and Publications Committees were re-elected as in 1909. The question of the annual outing was discussed. No place was decided upon for the present, but it was resolved that the outing take place about July 25 next. The new schedule for 1910 is to be left in the hands of the committee, and in it is to be included an audit of all the varieties staged at the last November show. A conference will be held in the Essex Hall in December next, and particulars will be announced later; exhibition blooms, however, will form the chief subject for discussion, and the Schedule Committee will carry out the details. The revised dates of the Floral Committee meetings are September 5 and 19, October 5 and 24, November 2 and 21, and December 7 and 19.

Referring to the trials of single varieties, visits by the Floral Committee will be made as follows:—To Messrs. W. Wells and Co. on September 10 and 24 and October 15; to Mr. H. J. Jones, at Keston, on November 12; to Messrs. Cannell and Sons on December 10.

Mr. Bevan referred again to the Chrysanthemum Show at Brussels, and hoped the members would assist in making a creditable display. Mr. Harman Payne agreed, but as the great expense was referred to, he expressed the hope that some official help might be obtained from the Royal Commission. The N.C.S. were quite prepared to uphold the honour of English horticulture, and would probably be the only English society to do so, but their financial position hardly justified their so doing as a mere matter of honour.

New members were elected, and the meeting closed after a rather long and interesting agenda.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday, March 14, Mr. C. H. Curtis in the chair. Six new members were elected, making a total of 32 for the past three meetings. Several members over 60 years of age took advantage of Rule 18 to draw the interest on their deposit account. A cheque for £11 14s. 4d. was drawn for the nominee of a late member. The amount paid to sick members was rather heavy, £60 5s. having been paid since the previous meeting.

Bournemouth Gardeners. Association.

MARCH 15.

On the above date George G. Hamilton, Esq., F.R.C.S., gave a lecture with demonstration on "The Fungi Causing Disease in Man and Animals" before the members and a number of the public who were invited by the committee to attend. The chair was occupied by Dr. N. MacGillycuddy, who introduced Dr. Hamilton to the audience.

Some splendidly painted specimens of fungi were shown—these being the work of Mrs. Walter C. Clarke, of Michelgrove House, Boscombe, Bournemouth. Dr. Hamilton also exhibited coloured photographs on glass, and some "cultures" of germs of various bacilli on gelatine in glass tubes. One tube in particular proved of great interest to the gardeners present, as it showed the tubercle bacillus of consumption growing on a piece of potato.

The lecturer directed attention to the umbrella shape of many kinds of fungi, and said the spores were thereby protected. Fungi were not formed after the manner of most plants, as they did not possess either stems or leaves, but were composed of great numbers of cells. They increased by means of spores, which were distributed by themselves, by air and by water running through drains and gutters. Unless the soil or position was suitable, the lecturer remarked, the spores would not grow, and he instanced certain fungi that grew freely enough on fir trees, and also in the soil under them, but not anywhere else, while others thrived on beech branches only. It was a difficult matter to determine which were edible and which poisonous fungi, even experts being sometimes deceived, Dr. Hamilton said. But beetles, slugs, and other insects were never in error in this matter. Our edible mushroom, the lecturer said, was supposed to have been first introduced into this country by the wild horse, and it was a fact that wherever horses grazed mushrooms grew. Dr. Hamilton said it was not properly decided as yet whether one or a number of fungi were responsible for the commencement of "fairy rings," but it was a fact that as the fungus died it created sulphide of hydrogen, which caused the rings to widen out and occupy fresh soil; in the end, however, the fungus actually killed itself by what it produced.

The lecturer made some very valuable remarks about the timely spraying of young fruit trees, so as to prevent fungi gaining access to the inner parts of trunk and branches through deep cracks and other openings. He said there were plenty of old, neglected orchards in this country, and occasionally we could see the stems and branches white with limewash and similar preparations, but all such operations were practically useless, as the washes only touched the outer fungi, and left the internal portions free. Therefore, the only right method to pursue was to pay close attention to the well-being of all young fruit trees, and never let the fungi gain any hold upon them.

At the close of the lecture there was a discussion, several members and Dr. Hill taking part in it. In replying to a hearty vote of thanks, Dr. Hamilton referred to the great importance of light as a preventive of fungus growth.

A vote of thanks to the chairman brought to a close a very interesting and enjoyable evening.

Elstree Horticultural Society.

There was a large assembly in the Elstree Church Room on Tuesday, the 15th inst., to hear Mr. William Cutbush, of Barnet, deliver a lecture on "Roses." The lecturer dealt in a most thoughtful and capable manner with all the more salient features in connection with the production of "The Queen of Flowers," and at the close of his address was warmly applauded, and, after dealing with various questions in an efficient manner, was accorded a most hearty vote of thanks.

In connection with this meeting, there was a display of hyacinths by the school children in competition for prizes, and also an honorary exhibit of these same flowers, staged by Mr. E. Beckett, V.M.H., gardener to the Hon. V. Gibbs, the president of the society.

Reading Gardeners' Association.

There was again a large attendance of members at the fortnightly meeting held in the Abbey Hall, Reading, on Monday evening, March 21, the President (Mr. Alderman Parfitt, J.P.), occupying the chair.

As at the previous meeting, the hall was rendered most attractive by exhibits which would have done credit to Vincent Square. Beautiful cinerarias were staged by Mr. R. Doe, The Gardens, Holme Park (M. J. Sutton, Esq.), and a splendid group of Cineraria stellata was displayed by Mr. F. Townsend, The Gardens, Hillside (from the vice-president). Mr. W. Barnes, The Gardens, Bearwood, exhibited early cabbages, grown in the open, from seed sown in July, which would have been considered remarkable even three weeks or a month later. Mr. H. Goodger, gardener to Mrs. Collins, Stoneham House, Calcot, was awarded the association's certificate for his exhibit of violets.

The lecturer for the evening was Mr. T. Judd (chairman of the committee), and his subject, "Plants for Spring Bedding." Briefly touching on bulbs at the commencement of his remarks, Mr. Judd explained how by the exercise of a little thought and the judicious sowing of suitable seeds, it was a simple matter to quickly make the garden beautiful in early spring. The subjects advocated by the lecturer as being specially adapted for securing an early display of bloom included alyssum, arabis, aubrietia, daisy, erysimum, limnanthes, myosotis, pansy, nemophila, polyanthus, primrose, silene, stock, viola, and wallflower, while Canterbury bells and sweet williams might with advantage be used to extend the flowering period. Mr. Judd gave full information with regard to the preparation of the seed beds, time of sowing, and after-treatment of his favourites, with a view to obtaining the best possible results.

An exceedingly interesting discussion followed, and at the close of the meeting Mr. Judd was the recipient of congratulations and a hearty vote of thanks.

British Gardeners' Association (London Branch).

On Saturday, March 19, the members of the above branch entertained their wives and friends at a Bohemian concert at Carr's Restaurant, Strand. Mr. E. F. Hawes, chairman of the branch, presided, and there were about 100 members and friends present.

The musical programme, arranged by Mr. Andrews, proved a great success, and was thoroughly enjoyed. Selections from Shakespeare were admirably rendered by Mr. Clarke, and listened to with great interest. A vote of thanks to the ladies and gentlemen who kindly gave their services brought to a close a most enjoyable evening.

Banbury Gardeners' Society.

This society held its fortnightly meeting at the White Horse Hotel, Banbury, on Friday, the 18th inst., when Mr. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston Grange, very kindly gave a lecture in the place of Mr. G. Hunter, Blenheim Palace Gardens, who was unable to attend. There were about thirty members present.

Mr. Wadham gave a very excellent and instructive lecture on the "Culture of Early-Flowering Plants for Gardens and Allotments." He dealt principally with stocks, mignonette, forget-me-nots, violets, and some of the easily-cultivated orchids. The usual discussion followed. A very hearty vote of thanks was given the lecturer. A vote of thanks was also passed to the Mayor for presiding.

OBITUARY.

◆

MR. JAMES McINDOE, V.M.H.

We regret to learn of the death on March 16, of Mr. James McIndoe, V.M.H., who for a long number of years was gardener to the late Sir J. Pease, at Hutton Hall, Guisborough. Mr. McIndoe was a clever grower and exhibitor of fruits, and won hundreds of prizes all over the kingdom. During recent years Mr. McIndoe resided at Dartford. Death was due to cancer, and followed a long and painful illness.

Algæ in Water Tanks. — Dr. Voelcker recently exhibited some small, rather leathery masses of algæ, which had been taken from a cement tank, on the sides of which they had grown. The presence of the algæ, which proved to belong to a species of Oscillatoria, rendered the water unpleasant to drink. It was suggested that the tank should be covered, as the algæ would not develop in the dark, or that a weak solution of copper sulphate should be added to the water.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SWEET PEAS.—F. E., Salisbury: Try "Sweet Peas and their Cultivation," 1s. 2d., or 1s. 8d. (cloth), post free, from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C.

RUELLIA MACRANTHA.—E. R. B., Swinford: You can obtain Ruellia macrantha through any of those nurserymen who advertise indoor plants in our columns. It is an acanthaceous plant, and propagated by cuttings. In its younger stages it needs to be treated as a stove plant.

GAZANIA PYGMÆA.—H. J., Kingstown: Gazania pygmæa (Sond) is the same as G. bracteata of N. E. Brown, but we find neither name in any of the seed lists at hand. Try Messrs. Bees, Lim., Liverpool, or Messrs. Thomson and Morgan, of Ipswich.

BOTANICAL MAGAZINE. — F. J. M., Warrington: A great deal depends upon the binding and general condition of the copies, but even if these are good the value of the first thirty or forty volumes of this work is small. The value of the volumes you have is also further reduced because they commence with 1793 instead of at 1787, when the work began. Give us some idea of the binding, and say how many volumes there are (two or three years are often bound in one volume), and we shall be better able to help you.

OTIORHYNCHUS GRUBS IN FERNS.—Mr. C. T. Druery writes: "I saw in your 'Answers to Correspondents' of March 8, a note on 'Grubs in Ferns,' in which it is stated that twenty-four hours' immersion in water will kill the grubs. I have found that immersion in water for that time will bring many of the grubs to the surface, where, of course, they can be collected and killed, but not long since I experimented with some grubs, and found that even when kept under water for two or three weeks they revived when taken out and dried, so that immersion is not the practical remedy we have considered it to be, except in the partial way indicated. I am told by my fern-loving friends who have tried it that Vaporite is very effective, and I am making experiments myself which point in the same direction, though I cannot as yet absolutely confirm them. When the beetle appears it cannot stand immersion for more than a few minutes, and with a pot plant or pans of seedlings attacked by them a few minutes immersion under water brings them unfailingly out of their hiding places, whence they crawl up to the light, and are easily caught. As they are usually content to prey upon the plants nearest their point of emergence from the soil in which they have passed the grub stage, it is well, directly their attack is noticed, to plunge the pot or pan as directed, and secure their capture."

JUDGING ROSES.—T. G. M., Hampton: The National Rose Society, in dealing with this subject, suggests that three points should be given for high-class blooms; two for medium; one for those not so good, but not bad enough to cut out; and one or even two extra points for a very superior bloom. One point should be taken off for every bloom decidedly bad. No point should be allowed for a bloom left tied by an exhibitor. A typical bloom of a three-point rose (which may be carried by one of the judges) should be selected, and referred to as necessary in order to keep up a uniform standard throughout the exhibits. In the case of trebles (which, if shown in boxes, must be arranged triangularly) each treble is to be regarded as a unit, and not as three separate blooms. Points must therefore be given as in Rule 22—three points for the best treble, two points for a medium treble, and so on. In the mixed classes Teas and Noisettes shall have no especial favour shown to them. Where the blooms are of equal merit, the judges shall proceed to consider their general evenness, variety, arrangement, freshness, and setting up in the stands, the boxes being placed side by side and in the same light for the purpose of comparison.

HORTICULTURAL EXHIBITIONS AT BRUSSELS.—F. E. C., Liverpool: In connection with the International Exhibition, to be held in Brussels this year, three great horticultural exhibitions have been arranged, and special information concerning these can be obtained from the Secretary, Horticultural Committee, 8, Whitehall Place, S.W. We may state, however, that the first show will be held from April 30 to May 3, and is for hardy and hothouse plants, forced fruits, and vegetables, and will include a section for floral decoration; entries close on April 15. The second show, from September 24 to 27, is for fruit and market garden produce; entries close on September 10. The last show, to be held from October 29 to November 2, is for flowers and chrysanthemums; entries close on October 10.

DAFFODILS IN BORDERS. — M. L. M., Newport (I. of W.): It frequently happens that when daffodils have been planted rather closely in groups of a variety, either between shrubs or among herbaceous plants, they do well for a time and then deteriorate. The reason is that the bulbs have increased in number, and there is a fight for existence, and until some of the bulblets are crowded out into new soil, or some have been squeezed out of existence, there will be few good flowers. As soon as the leaves die down this year lift the groups of bulbs (taking care to keep them labelled and apart from each other) and separate the bulbs. The larger bulbs may be planted in beds or borders—not on the old sites unless quite new soil is provided—and the smaller ones be planted in rows in a nursery border, there to increase in strength and size and presently make good flowering bulbs. It is a good plan to lift, sort out, and replant daffodils at least every third year, though most people who are keenly interested in these flowers lift and replant every year, or not less seldom than alternate years.

EXHIBITING SWEET PEAS.—C. L., Abergavenny: The National Sweet Pea Society has a number of regulations governing the exhibition of sweet peas, and referring not only to the flowers themselves, and their display, but also to the show arrangements, etc. These would occupy more space than we can spare in these columns, but you can obtain them in full in the schedule of the society, a copy of which will be forwarded on application to the Hon. Secretary, Mr. C. H. Curtis, Adelaide Road, Brentford.

GORSE FOR COVER.—W. I. J., St. Mellion: The common gorse or furze (Ulex europæus) will serve the purpose admirably, especially if a portion of the cover is cut over every third year.

PHOSPHATE OF POTASH FOR SWEET PEAS.—S. N., Bath: Phosphate of potash is an excellent fertiliser for sweet peas if first applied when the flower buds are forming, and then not more often than once a week during the flowering season. It should be given in liquid form, dissolving 1oz. in [illegible] gallons of water, this amount being sufficient for three or four feet run of row. As the plants develop and carry more [illegible] flowers the strength of the application may be gradually increased to 1oz. per gallon, but on no account must this stimulant be given when the soil and roots are dry. If dry, water with clear water and follow with the fertiliser the following morning or evening.

BY SPECIAL APPOINTMENT TO HIS MAJESTY KING EDWARD VII.

GREEN'S PATENT LAWN MOWERS.

THE FIRST, FOREMOST, and BEST in the WORLD. Hundreds of Thousands are in use. Established nearly a Century.

NAMES OF PLANTS

A. C., Humble.—Iris japonica.

G. R., Sandy.—Begonia megastigma.

R. R., Guernsey.—1, Rhododendron barbatum; 2, R. Keysi; 3, Pittosporum Tobira.

H. E. B., Padstow.—1, A form of Cypripedium Euryades; 2, Monstera deliciosa; 3, Odontoglossum triumphans.

M. E. W., Leatherhead.—1, Forsythia suspensa; 2, Scilla sibirica; 3, Helleborus colchicus; 4, Saxifraga apiculata.

C. H. J., Hinckley.—1, Primula Forbesi; 2, P. floribunda; 3, Saxifraga apiculata; 4, Odontoglossum loochristiense.

S. O. A., Bridgwater.—1, Laurus camphora; 2, Iris reticulata; 3, Petræa volubilis; 4, a good form of Primula obconica.

ZONAL PELARGONIUMS.

The very interesting and timely article by Mr. T. Stevenson, on page 166 of the GARDENERS' MAGAZINE, will prove of great service to many readers. I fully agree with all your able correspondent says; and I strongly advise all inexperienced cultivators of the popular zonal to duly note the instructions given, as Mr. Stevenson always excels with plants that he undertakes to cultivate.

The principle of propagating two batches of cuttings during the year, firm potting and cool treatment, but full exposure to the sunshine at all times are sound, and should always be adopted. There are now many new and extremely handsome varieties, especially in the single-flowered section, and the list given by Mr. Stevenson is an excellent one. I would like to add another variety, namely, Lady Warwick. It is such a beauty in every respect; the lovely flowers are freely produced, and the habit of the plant is perfect; in fact, this is a grand variety to grow on into large specimens, as recommended by your correspondent. An old semi-double flowered variety, named Guillion Manglessi, was very largely grown twenty-five years ago. It was much used for table decoration, the colour, purplish-crimson, showing up grandly in the artificial light. The habit of the plant was all that could be desired, dwarf, and very bushy. The flowers were produced in great profusion, similarly to those of the white-flowered Hermione. Throughout the summer months the plants were grown in the open air, and placed in a warm house in September. With the exception of Raspail Improved, I have not seen a better variety for table and general house decoration in the dull days of winter.

GEO. GARNER.

Anemone coronaria.—A beautiful, yet inexpensive display is readily obtained from the single and double forms of the poppy anemone, the dormant corms being freely offered by trade growers at the present moment. They embrace a wide range of colours, and may be had either in mixture or in distinct shades to name. Where the ground has been prepared in advance, planting may be carried out immediately on receipt, placing the tubers some three inches deep, and making them moderately firm in the soil. All the forms of Anemone coronaria succeed in a light, loamy, well enriched soil, and in positions where they receive a large amount of sunshine; light shade is, however, beneficial by enabling the flowers to retain their qualities longer. They produce a good effect when massed in beds and borders, and if a planting distance is observed that admits of the introduction of some late-flowering annual among them, no awkward vacancy occurs when they ripen off. An excellent practice is to plant them alternately with tufted pansies (violas), and where the spent flowers and seed pods of the latter are early removed, the maximum season of flowering is thereby secured. Poppy anemones planted in spring come into flower during June and July, thereby forming a succession to those planted in autumn.—THOMAS SMITH.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

WEST FIELD HOUSE, RICCALL.

TO BE SOLD BY AUCTION, by MESSRS. RICHARDSON and SON, at the SWAN INN, SELBY, on MONDAY, the 11th of April, 1910, at Half-past Three o'clock in the afternoon, in two Lots, and subject to the General Conditions of Sale of the Yorkshire Law Society, and to such Special Conditions of Sale as will be then read, the undermentioned valuable

FREEHOLD PROPERTY, namely.

LOT 1.

COMMODIOUS DWELLING-HOUSE AND MARKET GARDEN, containing more or less four acres and twenty perches, and now in the occupation of Mr. E. D. Lumb.

LOT 2.

Well-built COTTAGE, pleasantly situated near to Lot 1, and with a good Garden adjoining, in the occupation of Mr. G. White.

Lot 1 consists of a substantially-built Dwelling-house, with two Front Rooms, Kitchen, Dairy, Pantry, etc., four Bed-rooms, large Attic, and the necessary Out-houses. Also Stable, Cow Shed, Pig Styes, Barn, Fodder-room, Cart-shed, etc., together with the Market Garden. The Land is excellent sand, very productive, and considered one of the earliest gardens in the district. It is well stocked with young Fruit Trees of the best varieties and in full bearing, together with Rasp, Logan, and other Berry Trees.

Lot 1 will be sold to include the whole of the Fruit Trees and Market Garden Tenantright.

Lot 2 contains Front Room, two Living-rooms, Dairy, three Bed-rooms, and the necessary Out-houses. Also Loose Box, Stable for two horses, large Pigstye. There is a good Garden adjoining.

Both the Lots are within five minutes' walk from Riccall N.E.R. Station, and adjoin the high road from Riccall to Cawood.

The two Lots have a good supply of water.

Further particulars may be had from the Auctioneers, Selby; or from

Messrs. BOOTH, CLOUGH, and WADE,
Solicitors,
Central Bank Chambers, Leeds.

Selby, March 23rd, 1910.

ENCYCLOPÆDIA OF GARDENING.

A complete Dictionary of Cultivated Plants, Flowers, Fruit, Vegetables, Trees, Shrubs, etc. By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening" and "Farm and Garden."

CONTENTS.

NAMES.—The popular and botanical name of every cultivated plant, etc., grown in British gardens.
PLANTING.—When and How to Plant.
POSITION.—Where the plants are best grown—whether in sun or shade.
SOIL.—The exact soil required by each genus.
WATERING.—Whether much or little moisture is required, and when.
TEMPERATURES.—Artificial heat for greenhouse plants, including orchids.
MANURES.—Best artificial and other manures.
PROPAGATION. — How and when to propagate plants, etc.
FORCING.—Temperatures and hints on forcing.
PRUNING.—Pruning concisely described.
DURATION.—States whether the genera described are annuals, biennials, perennials, etc.
NATIVE COUNTRY.—Gives the native habitat of each species and date of introduction into Great Britain.

Published by
W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.

NOTES OF THE WEEK.

◆

Wind.

To the gardener generally wind is regarded far more as foe than friend, since in many cases it is necessary to take protective measures in the shape of wind screens, or selection of sheltered spots, if he desires to see his floral pets attain their full beauty. Without wind, however, that is, with a perpetual calm, not only would the horticultural and agricultural world be in a parlous plight, but the general conditions of environment, which by their own variability and diversity have led to the evolution of such innumerable types of organic life, would be entirely changed. Winds, in fact, are simply manifestations of that wonderful system of aerial currents which form one of the most vital factors of existence. By their agency inconceivably vast volumes of life-giving water are wafted from the tropics across the oceans, either in the visible form of clouds, or invisibly as uncondensed vapour. On reaching land they deposit much of their precious burden to feed our streams, and in the form of rain or snow irrigate the thirsty soil in an infinitely more perfect manner than can be done by any artificial system. Without the wind not only would the air be stagnant, but the oceans also, since it is almost entirely by wind agency that the great circulatory system of the world of waters is maintained. This being so, a little consideration will show us that as it is by the induced currents of warm water from tropical regions that our northern seas are raised in temperature, the great polar ice-cap, even though deprived of the snowfall brought by the winds, would invade an immensely larger area than it now occupies, by the freezing of all the temperate seas. The land itself, too, would be much colder deprived of the southerly air currents, and, in short, the probability would be, that the greater part of organic life would become extinct. A perfectly stagnant atmosphere would be incapable, too, of replenishing the supply of carbonic acid which is so essential to plant life. It has been demonstrated that in the lands of dense forests the carbonic acid over the wooded area would be entirely exhausted in a year or two, being locked up in the timber which it so largely contributes to form. By the wind the partially exhausted air is constantly renewed, and, without it, vegetation must cease for the reason given. Animal life, apart from its dependence upon vegetation for its support, would perish by exhaustion of the oxygen constantly inhaled and exhaled as carbonic acid by its combination with the carbon waste of the body. It is therefore abundantly obvious that the wind is an essential factor to all organic existence. Happily, however, there is no fear that such a condition of stagnancy, and consequent death, can arise. The mobile air has to yield to a thousand and one subtle influences bred from the all potent rays of the sun, and the varying conditions of the surface of the earth. The very revolution of the earth itself breeds the great air currents of the trade winds. The surface of the soil and that of water absorb the sunheat in different degrees, and as air by expansion becomes lighter the more it is warmed, upward currents are generated over warmed areas, and lateral currents are induced to compensate, these constituting winds of greater or less force. Hence quite apart from the major causes of prevalent winds across the oceans, there are innumerable local conditions which prevent stagnation. These local conditions also largely determine the rainfall, since the retention by the breezes of their precious burden of aqueous vapour is dependent upon their temperature, a lowering of which results in decreased capacity to retain, and, if lowered enough, in a fall of rain, snow, or hail, as the case may be, by simple condensation of the surplus. Thus when the warm southerly vapour-laden winds reach our shores from the Atlantic, and strike against our chilly hill or mountain tops, a portion of their load is immediately condensed as rain, and, on the same principle, we can see the reason why the strongly-heated, widespread sandy deserts of the east are comparatively rainless, not because the air is devoid of aqueous vapour, but because there is no inducing cause for deposition of that which it undoubtedly contains to a large degree, there, as everywhere else in the aerial ocean, at the bottom of which we live, and of which the winds are the tides and currents.

MR. GEORGE WYTHES, V.M.H.

Mr. George Wythes, V.M.H.—Over a long number of years Mr. George Wythes was well known to our readers through his writings in these pages, especially in our "Work for the Week" columns, and in matters dealing with fruit and vegetable culture. Latterly, however, since his retirement from the charge of the famous Syon House Gardens, Brentford, Mr. Wythes' pen has not been so busy. An eminently practical man, Mr. Wythes is recognised as one of the ablest exponents of the arts of vegetable and fruit culture, and the methods he adopted or improved upon are now followed in more gardens than we can number. Asparagus culture, strawberries as annuals, high-class potatoes, and hardy cabbages and kales are a few of the subjects to which he gave great attention, and he raised several excellent varieties of melons, French beans, cabbage, potatoes, etc. Fruit culture at Syon was no small thing, the forcing of strawberries and grapes being carried out on a very large scale, but with these, as with bush fruits, stone fruits, and apples and pears Mr. Wythes was absolutely master of his craft. Mr. Wythes has had a varied experience. He is a Worcestershire man, and was educated at the Queen Elizabeth Grammar School, at Worcester, but, losing both father and mother early in life, he was not able to take full advantage of the tuition to which he was entitled as the son of a freeman of the city, because he had to turn out and earn his living. He served his apprenticeship at Whitbourne Hall, then a large place, and extremely well kept up. He then went as journeyman in the gardens at Abernant House, Glamorgan, where Mr. Fothergill, a wealthy gentleman, had a fine garden and extensive herbaceous borders, and here he was made outside foreman at the early age of eighteen years. After a stay here Mr. Wythes went to The Hendre, Monmouth, the seat of Lord Llangattock, who was then J. A. Rolls, Esq.; here he remained as foreman for three years, and was offered the post of head gardener, but, wishing to gain further experience, he refused the offer, and went as foreman at Knole House, Sidmouth, and from thence to Woburn Abbey, where he was plant foreman for a year. After a short stay at Messrs. James Veitch and Sons' Chelsea nursery, Mr. Wythes acted as general foreman at Stourton Hall, Horncastle, for a time, and then became superintendent of the Alexandra Park, Manchester, where summer bedding was a great feature, and the decorating of the town hall was part of his duties. Here he stayed three years, and then became head gardener to H. W. Freeman, Esq., at Thurston Hall, Cheltenham, and during a period of five years he became famous in the Cheltenham district as a successful exhibitor of orchids, stove plants, fruits, and vegetables. For two years of this time Mr. Wythes was chairman of the Cheltenham Gardeners' Society, then a very flourishing institution. On the death of Mr. Freeman Mr. Wythes assumed the charge of Lord Hatherton's gardens at Teddesley Park, Staffs, remaining with him, and also with his son, who presently succeeded to the title, for three and a-half years. Lady Hatherton was sister to the Duchess of Northumberland, and when the charge of the famous Syon House gardens became vacant, on the death of Mr. Woodbridge, Mr. Wythes was recommended for the post by Lady Hatherton, and everyone knows how, for a period of nineteen years, he increased the fame of Syon, served two Dukes of Northumberland, and made a name for himself. Mr. Wythes is a member of the Royal Horticultural Society's Fruit and Vegetable Committee, a competent judge of garden produce, and he is one of the original holders of the Victoria Medal of Honour in Horticulture. He is also treasurer of the National Vegetable Society. Latterly, since his retirement from Syon, Mr. Wythes has lived in Brentford, but he is now moving to Bovingdon, near Hemel Hempstead, and the good wishes of all his friends for many years of happy and peaceful retirement will go with him.

International Horticultural Exhibition.—The Rev. W. Wilks informs us that a public meeting will be held on Tuesday, April 5, at the Royal Horticultural Hall, Vincent Square, Westminster, S.W., at 4 p.m., to consider the advisability of holding an International Horticultural Exhibition in London in 1912, and to appoint a committee of management.

Adaptation of the Plant to the Soil.—In the course of the second of the two "Masters" lectures on the adaptation of the plant to the soil, Mr. A. D. Hall, F.R.S., said the results of an inquiry into the classes of soils favoured by various cultivated crops showed the great importance of the mechanical constitution of soils, on which depended the power of the soil to hold water, and consequently also the temperature of soil and air. Referring to the peculiarities of the soil most favourable to fruit culture in Kent, Sussex, and Surrey, he said the soils found by experience most valuable for fruit culture showed remarkable similarities in the proportions of clay, silt, and sand present. So with soils best suited for potatoes, hops, and barley. With reference to the chemical factors governing plant growth, all good soils were neutral or faintly alkaline, but soil acidity was unfavourable to plants only indirectly by its influence on the development of soil bacteria and fungi. The third factor considered was the presence or absence of carbonate of lime. Some plants, such as the legumes, might be classed as definitely lime loving, but in other cases lime was negative in action.

The Spectroscope and Plant Study.—What should prove a most interesting and instructive lecture is to be given at the Royal Horticultural Hall, on Tuesday, April 5, at 3 p.m., by the Rev. Professor G. Henslow, V.M.H., whose subject is, "The Use of the Spectroscope in the Study of Plant Life."

The Late Mr. D. Thomson, V.M.H., who died in October last, did so much in the course of his long and active life for the advancement of horticulture that the proposal to perpetuate his memory can hardly fail to obtain the attention and support of horticulturists generally. As will be seen from the letter we publish on another page of this issue, it is suggested that the memorial take the form of a fund from which to grant pensions to aged and infirm gardeners and their widows, the fund to be administered by the committee of the Gardeners' Royal Benevolent Institution. No more suitable means of keeping alive the name of one of the greatest British gardeners of his day could well be conceived, and we trust the promoters of the movement will receive such liberal support that the fund will be sufficient to materially augment the number of pensioners of the Gardeners' Royal Benevolent Institution, and thereby worthily honour the memory of Mr. D. Thomson.

New Public Garden at Eastbourne.—The conversion of Motcome Garden, which was recently presented by the Duke of Devonshire to Eastbourne, into a public pleasure ground is rapidly approaching completion. This beautiful spot is in the centre of the old part of the town, and in preparing it for public use an endeavour has been made to preserve, as far as practicable, the natural features of the ground, and to avoid an over-elaboration of detail.

Pæony-flowered Dahlias at Wisley. The following prefatory note to the report on the trial of dahlias at Wisley, in 1909, which appears in the current issue of the R.H.S. "Journal," is deserving of the attention of those who grow dahlias for garden decoration: "One hundred and nine stocks of dahlias were grown for trial in the garden, the object of the trial being to ascertain the value of the plants for garden decoration. Those varieties that do not throw their flowers well above the foliage are, of course, useless for this purpose. All the stocks were planted out the first week in June, and although good plants were put out scarcely any growth was made until August, when all made excellent growth and flowered profusely late in the season. The pæony-flowered section formed a grand mass of colour, and for effect in the garden were much superior to any other section. There can be no question as to the value of this class, but to enable them to display their habit and beauty to the best advantage plenty of space should be given for each plant, not less than four or five feet apart each way. A moderate application of manure to the soil before planting, and a mulch of manure when they commence to blossom, are of great assistance to them."

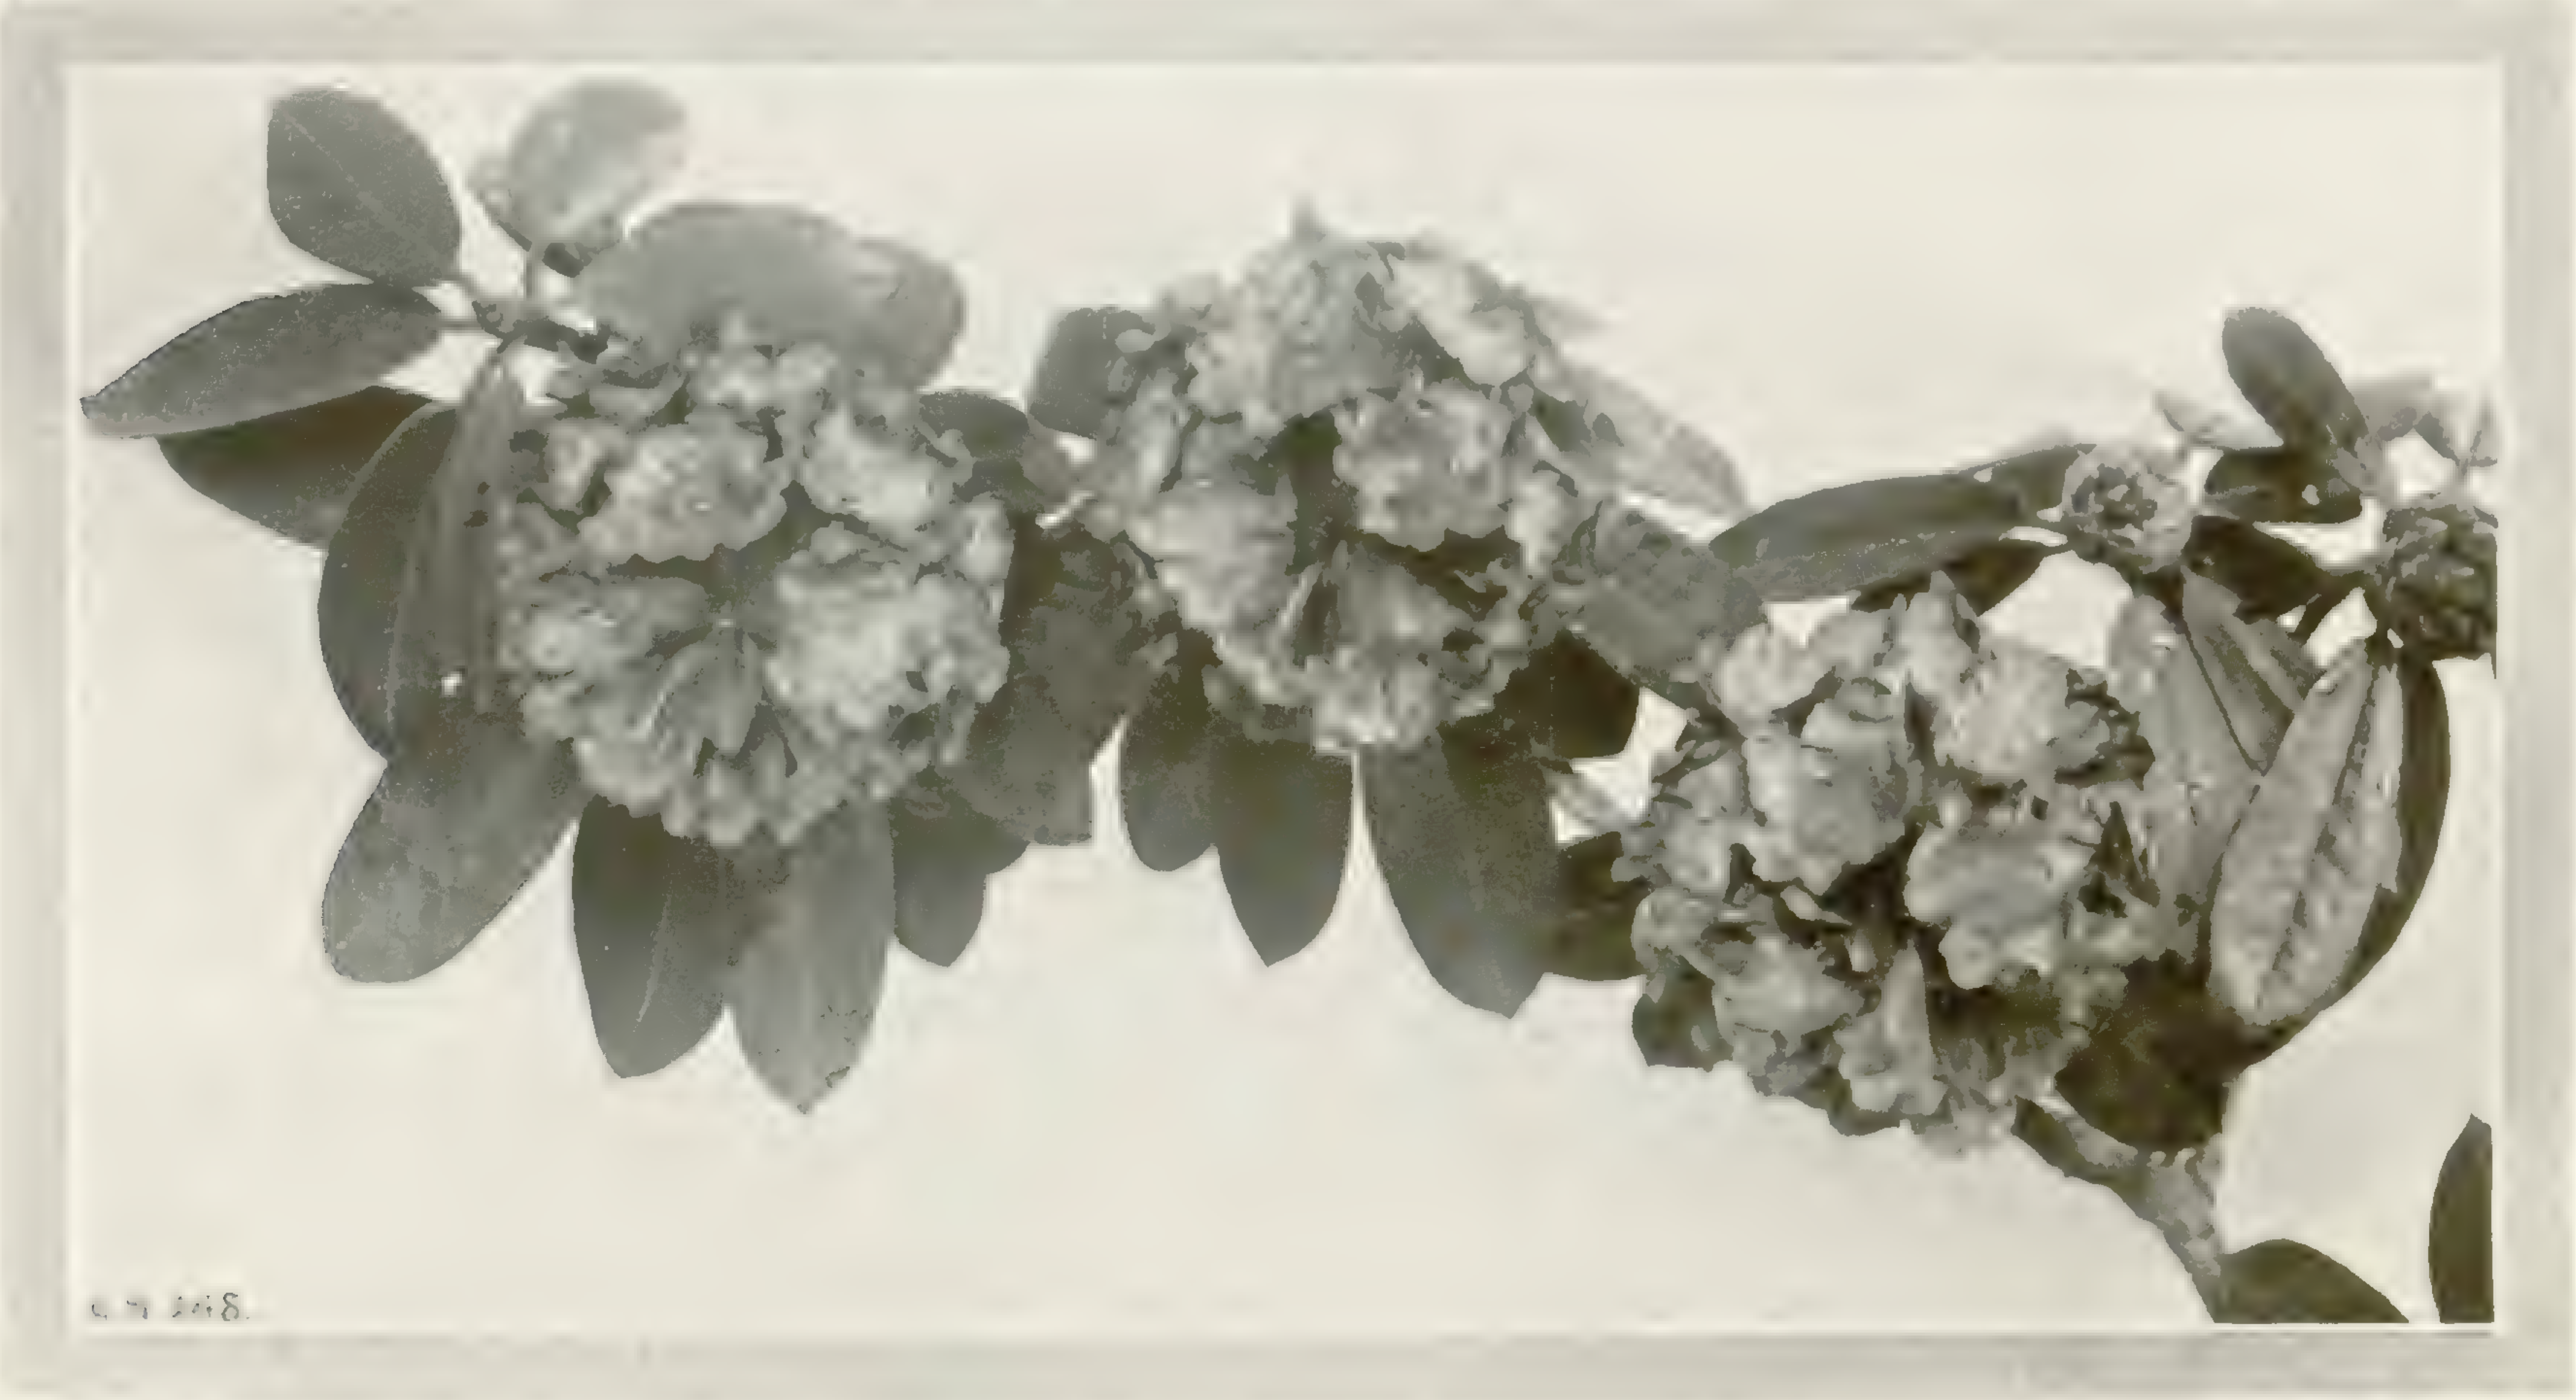
Women Gardeners.—At the annual meeting of the Horticultural College, Swanley, recently held at the Caxton Hall, a highly satisfactory report was submitted. This stated that there was a steadily increasing demand in secondary schools for "Garden Mistresses," who, in addition to practical outdoor work, should be competent to ground the pupils in one or more scientific subjects. The number of students on the books for the spring term this year was sixty-five, for the summer term seventy-nine, and for the autumn term sixty-one. Of twenty-six applications for teachers of gardening and Nature study in schools and institutions and gardeners in charge of school gardens nine had been filled by students from the college. Twenty-eight applications for head gardeners had been received, and eighteen for companion and under gardeners. The silver salver for the highest aggregate of marks in the diploma examinations was won by Sophia Hymans de Tiel. In the Royal Horticultural Society's general examination nine students entered: three were placed in the first class and six in the second class.

"**The Carnation Year Book,**" which has been received within the past few days, is the official publication of the Perpetual Flowering Carnation Society, and we congratulate the committee on their being able to give practical effect to their desire to present the members with an annual publication wholly devoted to the race of carnations with which the society is specially concerned. It contains the annual report and balance-sheet, rules, a list of members, a list of the prize-takers at the exhibitions held in 1909, and a budget of information on perpetual carnations and their cultivation, the last-named contributed by the leading cultivators.

A Hybrid Strelitzia.—There has recently flowered at Kew a hybrid strelitzia, raised by Mr. W. Dallimore, who crossed S. Reginæ with S. augusta eleven years ago. We gather from the "Kew Bulletin" that the plant is 5ft. high and has ten leaves, shaped as in S. augusta, but the petioles are 18in. long and the blades 2ft. by 15in. The peduncle is axillary, 18in. long; the spathe is horizontal as in S. Reginæ, with several vertical flowers, which expand in slow succession and are of a pale watery-yellow colour. There is a wide difference between the two parents, S. augusta having a woody stem 12ft. or more high, while S. Reginæ has no distinct stem, but the tuft of leaves spring from a fleshy root-stock. Both the parent species were also in flower in the same house. The hybrid has been named S. Kewersis. The general appearance of the flower in S. Kewensis resembles that of S. Reginæ more closely than that of S. augusta. The stamens are enclosed in the fused petal-sheath in the hybrid and in S. Reginæ, but are exposed in S. augusta. The small hooded petal of the hybrid, however, is much more like that of S. augusta, and it is also interesting to notice that the lilac-pink patches at the base of the sepals in S. augusta are also present in a similar position in the hybrid.

EARLY-FLOWERING SHRUBS.

Rhododendron præcox stands pre-eminent this season as an early flowering shrub, and is a wonderful sight. Although the blooms were frozen on the night of March 1, they took no harm. This beautiful rhododendron grows early, and the bright sunshine of May, 1909, enabled it to finish its growth before the wet summer arrived. This plant is a hybrid between R. ciliatum and R. dahuricum, and has bright mauve-pink flowers. It is an admirable plant for grouping, or as specimens among other shrubs. It is not very fastidious as to soil, and a mixture of equal parts good loam, leaf-soil, and peat will suit it well; planting should be as shallow as possible, and the soil made very firm. Care must be taken to afford moisture in hot weather, as nothing causes the plants to suffer so much as drought. R. præcox may be propagated by layers quite easily, and it is very hardy.



A FLOWERING SPRAY OF RHODODENDRON BARBATUM.

R. ciliatum is a very handsome early blooming species, and makes a grand show. Planted in good positions in front of larger specimens it makes a fine feature, and, being dwarf, it lasts in such positions some years. The flowers are delicate pink, changing to pure white. R. ciliatum sometimes suffers from spring frosts, but is well worth growing, as we do not always have enough frost to damage the blooms, and as the plants grow so close and dwarf it is a very easy matter to cover them over at night.

R. barbatum is most pleasing and fascinating from early in February until March. It is a fine species, hardy, and one that flowers in the coldest weather. It bears compact trusses of scarlet-crimson flowers, and when the sun touches them they are exceedingly brilliant. The small birds are sometimes a bother, as they pick the beautiful flowers to pieces, but this can be prevented by placing black cotton among the branches. R. barbatum does well in the partial shade of trees, which also forms a slight protection from frost. High, well-drained soil and copious supplies of water in dry weather suit it.

R. Shilsoni is a magnificent hybrid between R. barbatum and R. Thompsoni, and flowers midway between the two. It is sometimes said to be the finest hybrid yet raised. It carries beautiful trusses of large bell-shaped flowers, which are deep crimson, and perfectly lovely when lighted up by the sun. It is improved by periodical dressings of cow manure, which, however, should be kept away from the stem of the plants.

Andromeda japonica and A. floribunda are admirable plants for early blooming, and at the time of writing are making a fine display. These, like a good many more plants, benefit by liberal treatment, and delight in a dressing of cow manure occasionally; they also should be lifted now and again, especially if the roots become entangled amongst those of a coarser nature.

Erica codonodes is a fine plant at this season, and well worth the attention of all plant lovers, and a border of them is a fine sight. The plants attain large dimensions, 8ft. to 10ft. high, and as far through. This heath is easily raised from seeds, and is first-rate for cutting. E. Veitchi is a hybrid between the latter and E. arborea, and is also an early flowering variety, and a good grower. Erica carnea rosea, and E. c. alba are gems for alpine gardens or for beds on slopes, or as groundwork for plants of a taller nature. They will grow in good loam when well established, but at planting time a little fine leaf-soil or peat and sand will enable the roots to catch hold quickly, and this is an all-important point with many fine-rooted plants. Another point is they must be made very firm in the soil.

Leonardslee. W. A. Cook.

Asparagus Beds.—On heavy soils, and after the heavy rains we have experienced, these should be slightly pricked over with a fork, and given a good dressing of wood ashes, soot, and spent mushroom bed manure, followed by an application of artificial manure in April.—G. Ellwood.

ANTHOLYZA PANICULATA.

By far the finest of the antholyzas (Cape bulbs of unique appearance) is A. paniculata, whose fine foliage and panicles of curious flowers always attract the attention of the visitor to a garden in which it is grown. It has now been known to me for a considerable number of years, and its presence in a garden is always appreciated, although some people who see it for the first time do not realise the true worth of this flower. It makes broad, sword-like leaves, which are, however, prettily folded or pleated. The flowers are on tall stems, and are after the general style of those of the montbretias, but of a different formation. This may best be described by the definition of the specific name of antholyza, which is derived from the resemblance of the flowers in form to the open mouth of an infuriated animal. The likeness is not exactly apt, but it will pass as being as good as any we can suggest. They are bright scarlet, and are quite distinct in their way from any other bulbous flower of the season—late autumn. This antholyza is about three feet high.

There is a taller form, called A. p. major, but it is much later in coming into bloom, and is not at all suitable for northern gardens, as in these it sometimes fails to open ere frost destroys its leaves.

Antholyza paniculata is quite hardy when established in any save very cold parts of the kingdom, but it must be planted about six inches deep, and it is desirable to cover the place in which the bulbs are set with some cocoa fibre refuse or rough litter the first winter. Thus protected it will have a better chance of survival, the first winter generally being the most trying for non-established bulbs of its class. A group of some half-dozen corms, planted about six inches apart, will look well in the border of hardy flowers. Planting should be done as soon as the corms are received, but they need not be disturbed in after years unless they become too crowded.

S. Arnott

NOTES FROM KEW.

◆

Petræa volubilis.

Trained to a rafter in the same structure as the preceding this pretty warmhouse climber is bearing a considerable number of its pendulous racemes of bluish-violet flowers. It is a native of Central and the Northern portion of South America, from whence it was introduced as long ago as 1733. From the beauty of its inflorescence this petræa has become a popular plant in many tropical countries, the name of Purple Wreath being commonly applied to it. There is also a white-flowered variety in cultivation. In this country it was more often met with as a stove climber than it is nowadays. This is possibly owing to the fact that in a shaded structure it does not, as a rule, flower as freely, neither are the blooms so richly coloured as in the succulent house at Kew, where it has all the sunshine and light possible.

Begonia scabrida.

This is a decidedly uncommon species of begonia, and though the individual flowers are, compared with many others, quite insignificant, yet in all its features it forms a very ornamental specimen. It is of a freely-branching habit of growth, and is seen at its best when from three to five feet in height. The leaves, about six inches in length, are hairy, and yet have a glossy surface, while the blossoms, borne in many-flowered cymes, are pure white. A good bushy plant of this begonia, studded with its loose clusters of blossoms is, when at its best, a decidedly striking object. The "Dictionary of Gardening" gives its native country as Venezuela, and the date of its introduction 1857. It is not included by Mr. Watson in the best fifty begonias in his paper on these beautiful plants read at the Begonia Conference in 1893, but it seems to be now much appreciated, and deservedly so, at Kew.

Jacobinia coccinea.

This is, I believe, the oldest of the jacobinias in cultivation, and when in good condition, as it is now in the T range, is decidedly one of the showiest. There is a fine group of plants from three feet to four feet in height, each confined to a single stem and carrying a large head of flowers. In this way most of the jacobinias, and, in fact, many other acanthaceous plants, are seen at their best. The flowers, disposed in a large tapering head, are tubular in shape, the hood being pointed, and turned up at the tip. The colour is scarlet. This species is a native of Brazil, and was introduced in 1770.

Schaueria (Justicia) calycotricha.

Another Brazilian acanthad, whose flowers, like those of the preceding, are borne in comparatively large terminal heads. This, however, blooms freely when little more than a foot in height, so that it is especially valuable as an edging to the larger growers. The colour of the blossoms is clear yellow, by no means an uncommon tint among acanthaceous plants. A singular, yet at the same time pleasing, feature is furnished by the long bracts and calyx segments, which are of a good deal the same colour as the flowers, being cut up into narrow strips, thus giving to a head of blossoms a curious fluffy appearance. It is also in bloom in the T range.

Clerodendron myrmecophilum.

This is one of the more recently introduced species of clerodendron, and forms a very handsome flowering plant for a warm house. In the stove compartment of the T range it is flowering freely. Unlike many of the clerodendrons, which are of a vigorous rambling nature, this is a comparatively dwarf, erect-growing shrub. The stem is fairly stout, and clothed with long ovate-lanceolate leaves of a glaucous hue. The flowers are disposed in a terminal, pyramidal-shaped panicle, and arranged in regular whorls. Individually, they are about 1½ inches across, and of a bright orange-amber colour. As in several other species, the long and slender stamens are very noticeable, their colour in this instance being bright red.

This clerodendron is a native of Singapore, and was given a First Class Certificate by the Royal Horticultural Society in 1904. It was, however, grown at Kew previous to that time, having been sent there by its discoverer, Mr. Ridley, of the Botanic Gardens, Singapore.

Russelia sarmentosa.

A delightful subject for training to rafters or furnishing the end of an intermediate structure. In this latter position it is very effective in the begonia portion of the T range. This russelia is a loose, rambling plant, whose long and very slender shoots are clothed with small, variously-shaped leaves. The small scarlet flowers are borne in clusters in the axils of the leaves for some distance along the shoots, and when these latter are allowed to dispose themselves at will in a loose and informal manner a very pleasing effect is produced. One species, Russelia juncea, is well known, but this, though an older kind, is rarely met with.

Hard-wooded Plants.

In the greenhouse there is a fine display of this class of plants, and so attractive are many of them that one is tempted to ask the question whether our gardens are not the losers by the general neglect of hard-wooded plants? Conspicuous among those now at their best are chorizemas, with their brilliantly coloured, pea-shaped blossoms; heaths of different kinds, the bright-coloured, late-flowering Epacris longiflora; the double-flowered Epacris purpurascens flore plena, better known as Epacris onosmiæflora flore plena; Correa cardinalis, the brightest coloured of its class; Pimelia spectabilis, well known in the days of specimen plants; Boronia megastigma, whose delightful fragrance fills the air for some distance; Daphne indica rubra, of which much the same may be said; Bauera rubioides, a little twiggy shrub from Australia, with rosy-lilac coloured flowers; eriostemons in variety, all full of bloom, and all with white flowers; acacias in variety, particularly the smaller growers; and, of course, many forms of Indian azalea, whose blossoms range in colour from pure white to deep red.

Kalanchoe Dyeri.

This is well worth attention for greenhouse decoration, for although, taken individually, it might be described as leggy, yet for grouping purposes it is of considerable value, as shown by a small group in the greenhouse at Kew. This kalanchoe is a native of Nyassaland, and was first sent to Kew in 1902. It reaches a height of a yard or more, the stout erect stems being clothed with oppositely arranged leaves, broadly ovate in shape, and of a succulent character. The flowers, borne in terminal heads, are suggestive of a large bouvardia or jasmine. The colour is white. I am not aware that this species has yet been employed by the hybridist, but kalanchoes intercross so readily that no doubt in time we shall see some of its progeny.

Erlangea tomentosa.

This new composite, already described and figured in these pages, comes from British East Africa, and it has been flowering for months, and bids fair to continue for a long time yet. Messrs. J. Veitch and Sons were recently given an Award of Merit for it, but in their plants, as shown, the colour of the flowers appeared to be brighter, and the tomentose character of the leaves less pronounced than in the Kew specimens. This erlangea may be likened to an eupatorium with bluish-lilac flower heads; both classes of plants are of very easy culture.

Hippeastrums.

A fine group of these is already in flower, and a goodly show they make. The range in the colour of the flowers is so great, and many of them are of such a perfect shape, that it is by no means a matter for wonder that they have advanced considerably in favour within the last few years. It is true that the individual flowers do not last long, but if the plants are started into growth at different times the flowering season may be spread over a lengthened period. It is a pity that the botanist and the average gardener are at variance with regard to the correct name of these showy flowers, for in gardens they are amaryllis, and will doubtless long remain so.

Cytisus filipes.

This Teneriffe member of the broom family is in flower in the Temperate House, and an exceedingly graceful specimen it makes when at its best. At that time the long thread-like semi-pendulous shoots are studded with pretty white pea-shaped blossoms. The finest specimens of this broom, and also of Cytisus racemosus, that I have even seen grown in pots were in this structure about forty years ago. The plants of both species were raised from seeds, and were grown on without being stopped in any way, the leading shoot being tied securely to a stake. Grown in this way the plants formed almost perfect pyramids ten feet to twelve feet in height, and when in full bloom they were charming. Of course, C. racemosus was naturally far more dense than the other.

Grevilleas.

Some interesting species are now flowering in the Temperate House, notably G. longifolia, with long white leaves, toothed at the edges, and white underneath. The flowers, borne in clusters, are pink, each having, in common with most grevilleas, a long prominent style. In Australia this attains the dimensions of a small tree. Grevillea ornithopoda, as drooping as the weeping willow, has curious leaves, broad at the apex, where they are divided into three lobes; it has clusters of small white flowers. Grevillea punicea has heads of red flowers, and G. Thelemanniana or Preissi, one of the showiest of all, bears its roundish bunches of yellow and red blossoms at the points of the shoots, which droop with their weight.

K.

Dipladenias and Combretums.—These two beautiful stove climbing plants are not met with as often as they used to be, but they are nevertheless well worthy of a place in every plant stove where there is plenty of overhead room. These do best if potted in a compost consisting chiefly of good peat, with a little loam and sand added. The pots should be pretty liberally crocked, as, generally speaking, they do not care for much water, though, of course, after the plants begin to grow away freely they will take much more than immediately after potting. They both flower on the current season's growth.—T. S.

ANNUALS.

The value of annuals in the summer garden cannot readily be overestimated. Their importance is receiving wider recognition, as not only are they reliable subjects where a large and regular supply of cut flowers is required, but the majority lend themselves to colour schemes, whether carried out on a large or small scale. Their usefulness in this latter respect extends to the smallest garden, and, in such, we have frequently noted perfection of growth and harmony of colour such as few large gardens ever dream of striving after.

In their cultivation annuals are treated more rationally than was the case some years ago, consequently their popularity must increase, as their cultural details are simple. The ground should be thoroughly dug over with the spade in autumn or winter, incorporating a light dressing of farmyard manure, leaving the surface rough to be acted upon by frost. After digging, sprinkle a dressing of basic slag and kainit upon the surface, 6lb. of the former to 3lb. of the latter per 40 square yards of ground; failing these manures, then apply 4lb. of superphosphate to the same amount of ground before seed sowing or planting in spring. The chief advantage gained in supplying potash and phosphatic manures to annuals is, that it assists the production of flowers, and the plants are not so liable to become coarse. Annuals succeed best when sown direct in their flowering positions, the ground being forked over in spring, and, when dry enough to work free, made moderately firm by treading; the surface is then levelled in order to receive the seeds. The ground may be marked off in lines, and shallow drills made, and the seeds be then sown in lines or at regular intervals.

In the first instance, the plants are easily spaced off to the required distance with the hoe after germination. Thinning is a crucial item in the culture of hardy annuals, and must be carried out as soon as the seedlings can be handled, and is best performed in two or three operations. The distance apart for flowering plants may safely be taken at two-thirds the average height of the variety, and although one may hesitate to thin Shirley poppies two feet apart, it requires but the practical test to convince impartial minds that the gain in quantity and quality of the flowers and the duration of each plant is always in favour of drastic and early thinning. It requires still further to emphasise the need for suppressing seed production, either by liberally cutting the flowers while in perfection for indoor use, or by removing all spent flowers as soon as they fade. In conjunction with this treatment, afford a liberal supply of water during periods of drought, and an occasional watering of liquid manure, to secure the maximum production from the plants. Staking is a necessary operation with many annuals, and must be performed early; the best material is bushy twigs, such as birch, beech, or hazel, and these, when applied early, are quite inconspicuous once the plants begin to flower.

While the principle of outdoor sowing is generally to be recommended for hardy annuals, excellent results can also be secured by sowing in unheated frames, and transplanting the seedlings to their flowering quarters in the open. In default of autumn sowing, this method is extremely useful in securing an early (or for prolonging a late) display of these favourite flowers. Cold frames yield much the best results with half-hardy annuals; under these conditions seed may be sown early, and strong, sturdy plants secured in time for planting out in May and June; transplanting has but a momentary effect in checking growth, as the plants take to their new quarters without apparent loss.

Tender annuals must, of necessity, be raised in heat, and are only satisfactory when grown rapidly under favourable conditions from seed sowing until they flower.

Walmsgate Gardens. Thomas Smith.

IMPERIAL TEN-WEEK STOCKS.

One of the most robust of the many strains of ten-week stocks now on the market is that sent out by Messrs. Webb and Sons, of Stourbridge, under the title of Imperial. For robustness, beauty of form and colour, continuity of the flowering season, and wonderfully small percentage of single flowers, this strain is not surpassed by any other of its section. Such ten-week stocks are invaluable for the decoration of the garden in the summer, and if seeds are sown in boxes, in frames, or even on a sheltered border during the first half of April, excellent results will follow ordinary care. Imperial ten-week stocks are fine for beds in the pleasure-grounds, and are invariably a great attraction when grown in public gardens, their bold spikes of fine blooms, and their delicious fragrance, eliciting much admiration. The accompanying view shows the possibilities of these Imperial ten-week stocks in a bold mass on large beds. The strain is supplied in no fewer than six distinct colour varieties, these being canary-yellow, crimson, purple, white, rose, and light blue. The average height of well-grown specimens is one and a-half feet.

A FINE BED OF WEBBS' IMPERIAL TEN-WEEK STOCKS.

The late Mr. C. B. Clarke's Work on Cyperaceæ.—We learn that the voluminous manuscripts on the Cyperaceæ by the late Mr. C. B. Clarke have been presented to Kew by his executors. They consist of 11,722 narrow sheets written in the well-known small neat style, often with pen-and-ink sketches in the margin. They have been bound in thirty-one volumes. There are in addition many thousands of references to Cyperaceæ written on small slips. These have been pasted down in six thick folio volumes. Two copies of the "Illustration of Cyperaceæ" have also been received, one from Mr. G. Massee and the other from the publishers.

NEW PLANTS, ETC.

CATTLEYA ROBERT DE WAVRIN WESTONBIRT VAR.

This is a superb variety of the fine hybrid from C. Schilleriana and C. Schroderæ. In form, size, and substance, it must rank as one of the finest of cattleyas, while its lovely pale rose sepals and petals, and rosy lip with bluish-purple apex and orange throat, are all that is charming in the way of colour. F.C.C., R.H.S., March 22. Lieut.-Colonel G. Holford, C.V.O. (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

LÆLIO-CATTLEYA TRIMYRA.

An erect-growing hybrid that had three medium-sized flowers on one spike. The parents are C. Trianæ and L.-c. Myra. The sepals and petals are yellow, and the lip orange-yellow, and there is practically no trace at all of the C. Trianæ colouring. A.M., R.H.S., March 22. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

ODONTOGLOSSUM GLADYS VAR. H. W. CHEAL.

A graceful and beautiful odontoglossum obtained by crossing O. cirrhosum with O. crispo-Harryanum. The flowers are white, shaded with yellow, and heavily blotched with bright chocolate-red. See illustration on p. 253 of our issue of March 26. A.M., R.H.S., March 22. Messrs. J. and A. McBean, Cooksbridge.

ODONTOGLOSSUM THOMSONIANUM GATTON PARK VAR.

In this hybrid the parents were O. crispum Mary Colman and O. Edwardi, and the flowers differ from the original O. Thomsonianum in having a band of rose round the violet-purple colouring. A.M., R.H.S., March 22. Sir J. Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

HOULLETIA SANDERI.

A very distinct, but not very attractive orchid; apparently quite new. It has erect spikes about a foot high, and these carry two or three inverted fleshy flowers that are pale creamy white with a yellow mark on the lip. A.M., R.H.S., March 22. Messrs. Charlesworth and Co., Haywards Heath.

CALATHEA CROCATA.

This very distinct and handsome stove plant is by no means new, as it was introduced as long ago as 1871, from Mexico. It is of tufted, maranta-like growth, but the slightly undulate leaves are more erect than those of most of the garden marantas; the leaves are deep green with a purple under surface. Especially attractive are the erect spikes, each crowned with a number of brilliant orange-coloured bracts, each bract sheltering a pair of tiny yellow flowers that are not very prominent. The plants shown were in 48-sized pots, and almost every one carried three inflorescences. A.M., R.H.S., March 22. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

CARNATION R. F. FELTON.

A splendid perpetual-flowering variety with unusually broad petals that make up a very large, full bloom. The colour is a rich and pleasing shade of pink. A.M., R.H.S., March 22. Mr. H. Burnett, Guernsey.

PARTHENOCISSUS TRICUSPIDATA.

The above is, as we have already pointed out, but another name for the popular Ampelopsis Veitchi, and the botanists tell us it is the correct one. "Bot. Mag," t. 8,287.

ASPARAGUS TETRAGONUS.

A strong growing, climbing species, with large tubers as part of its root system, cladodes in fascicles, and white flowers borne in considerable numbers in racemes from two to three inches long. "Bot. Mag.," t. 8,288.

PRUNUS MARITIMA.

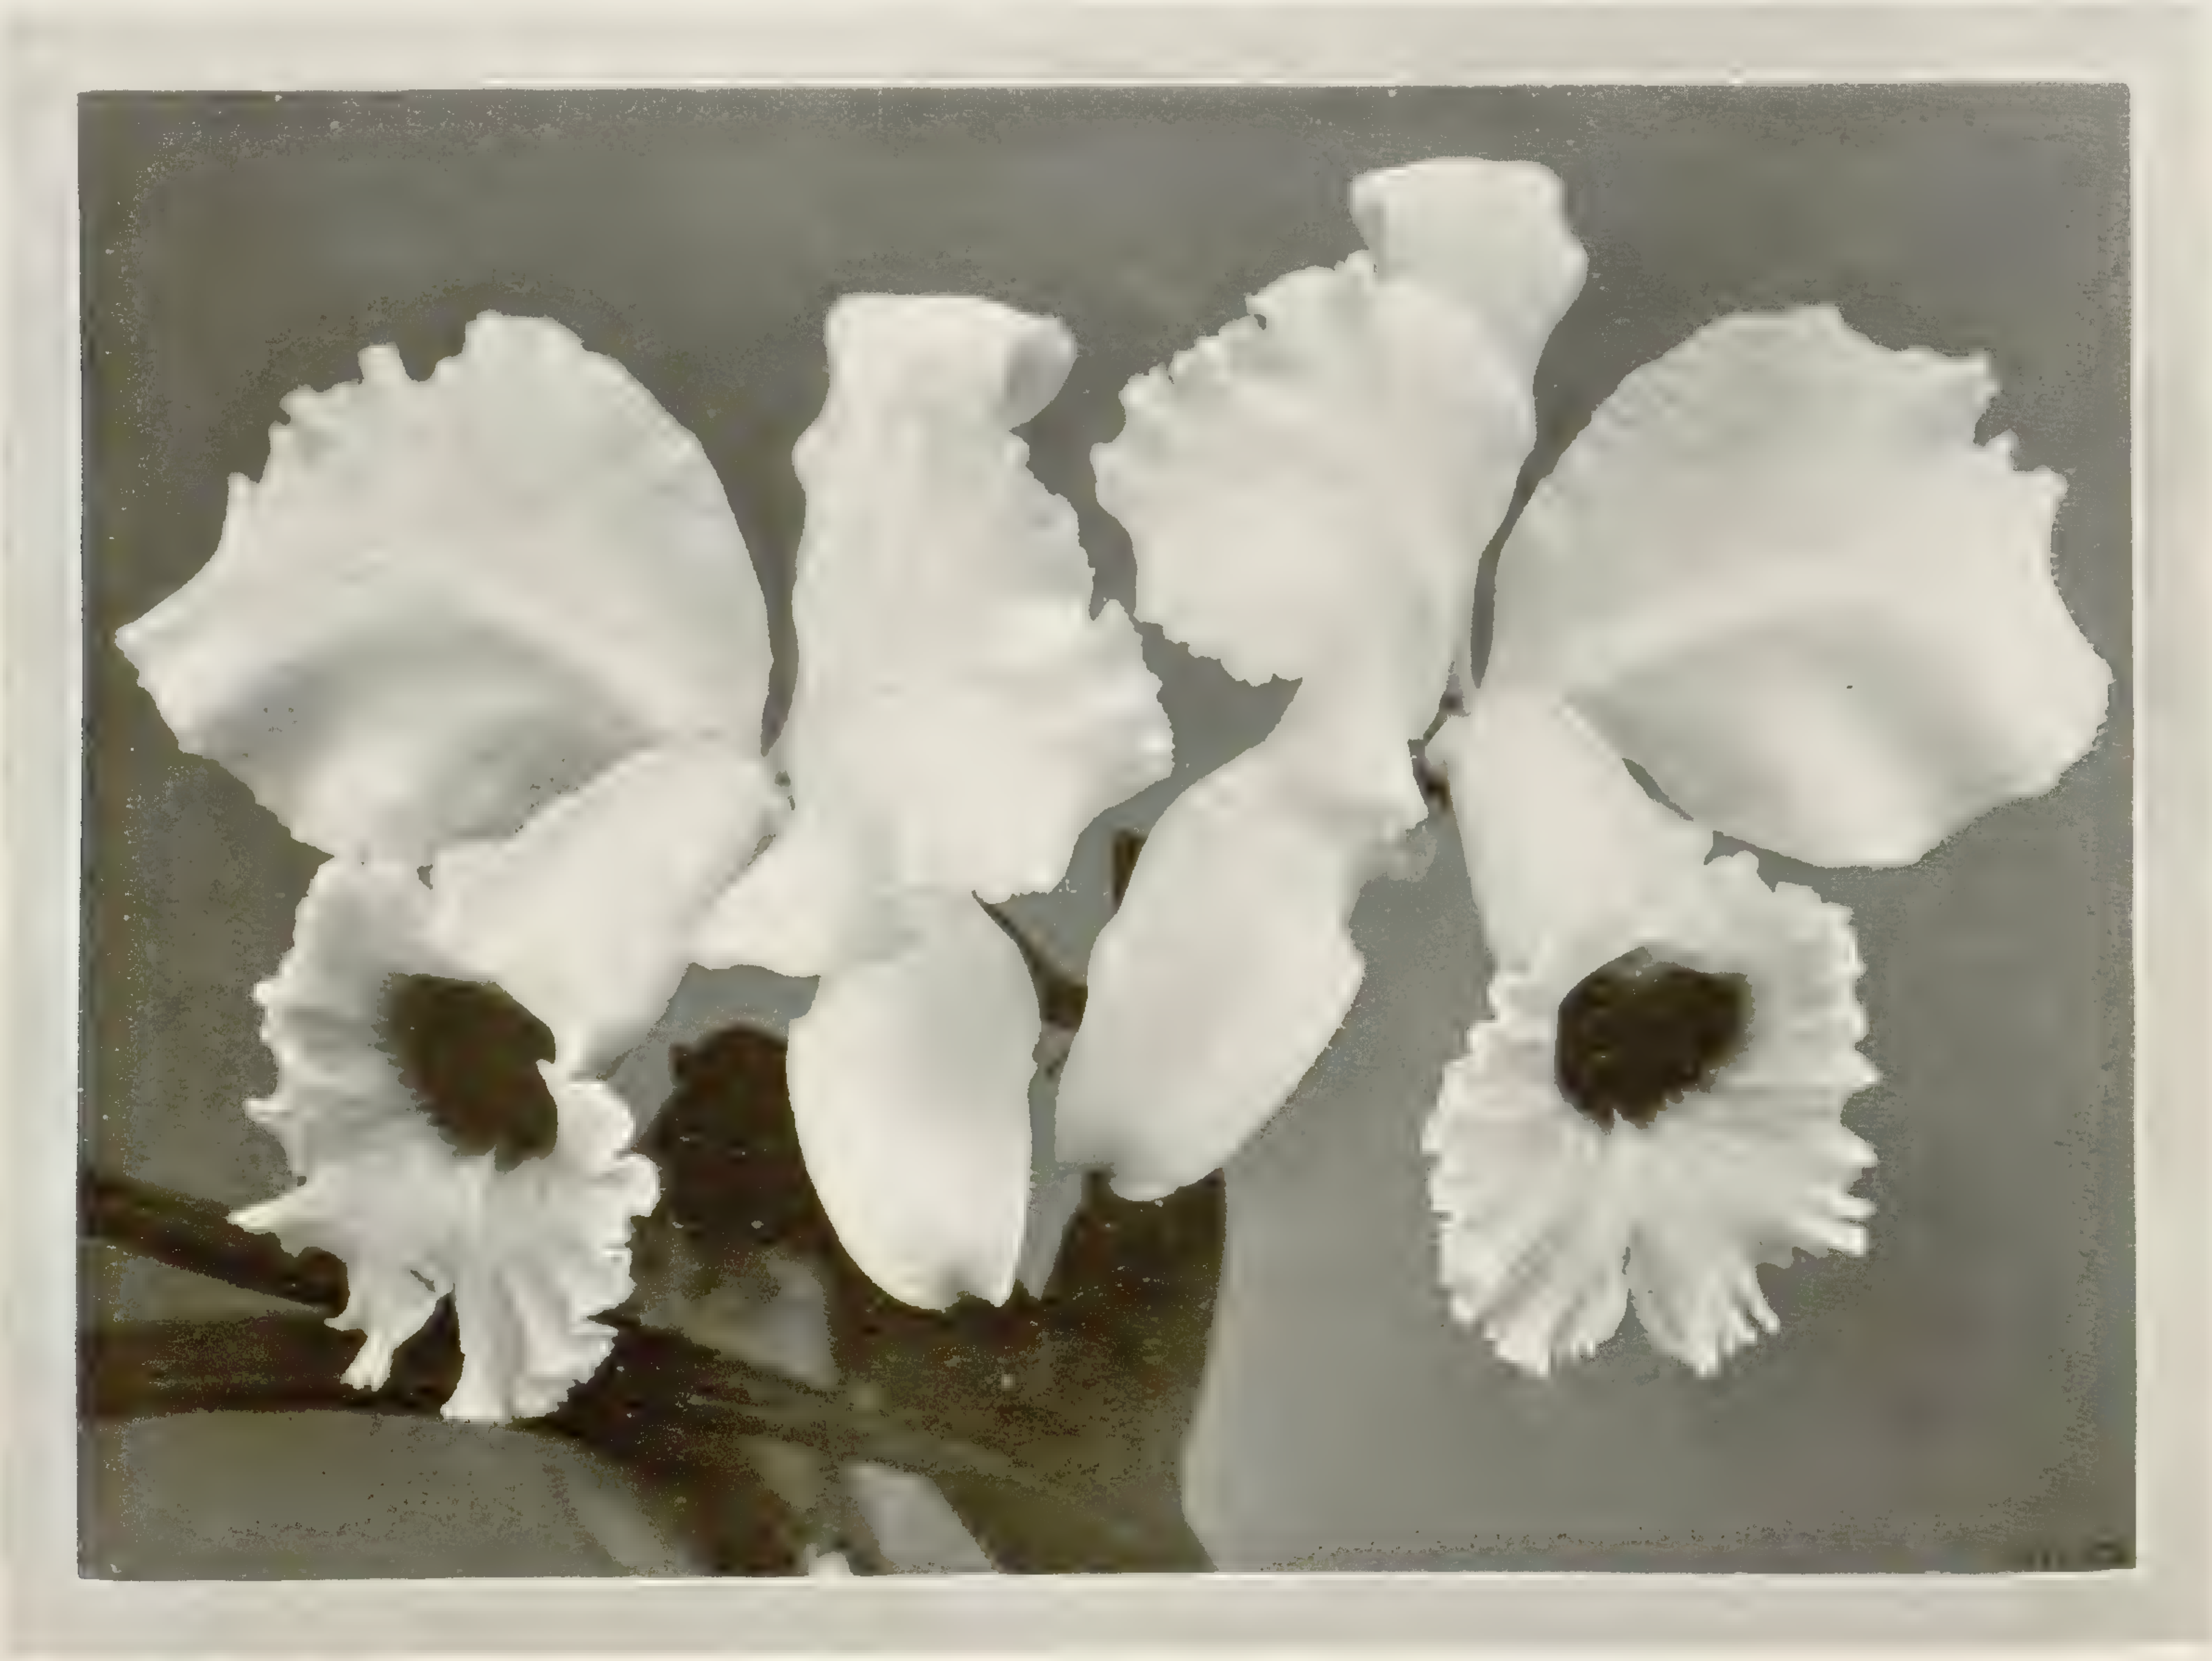
This is the Shore plum of Eastern North America. It forms a low, spreading bush, producing its white flowers in great profusion in May, that are followed by roundish red-purple fruits. The flowers last longer in perfection than those of most plums. "Bot. Mag.," t. 8,289.

OPUNTIA IMBRICATA.

An interesting succulent plant from Mexico and Arizona. It may grow to a height of 15ft., and, though easily grown, it rarely flowers under cultivation. The blooms are nearly three inches across, bright purple, with yellow anthers. "Bot. Mag," t. 8,290.

EURYOPS VIRGINEUS.

A South African composite that is only hardy at Tresco and other favoured localities in the British Isles. It is shrubby, has very small green leaves, and produces a number of deep yellow flowers at the ends of the growths. At Tresco it flowers freely in March and April. "Bot. Mag.," t. 8,291.



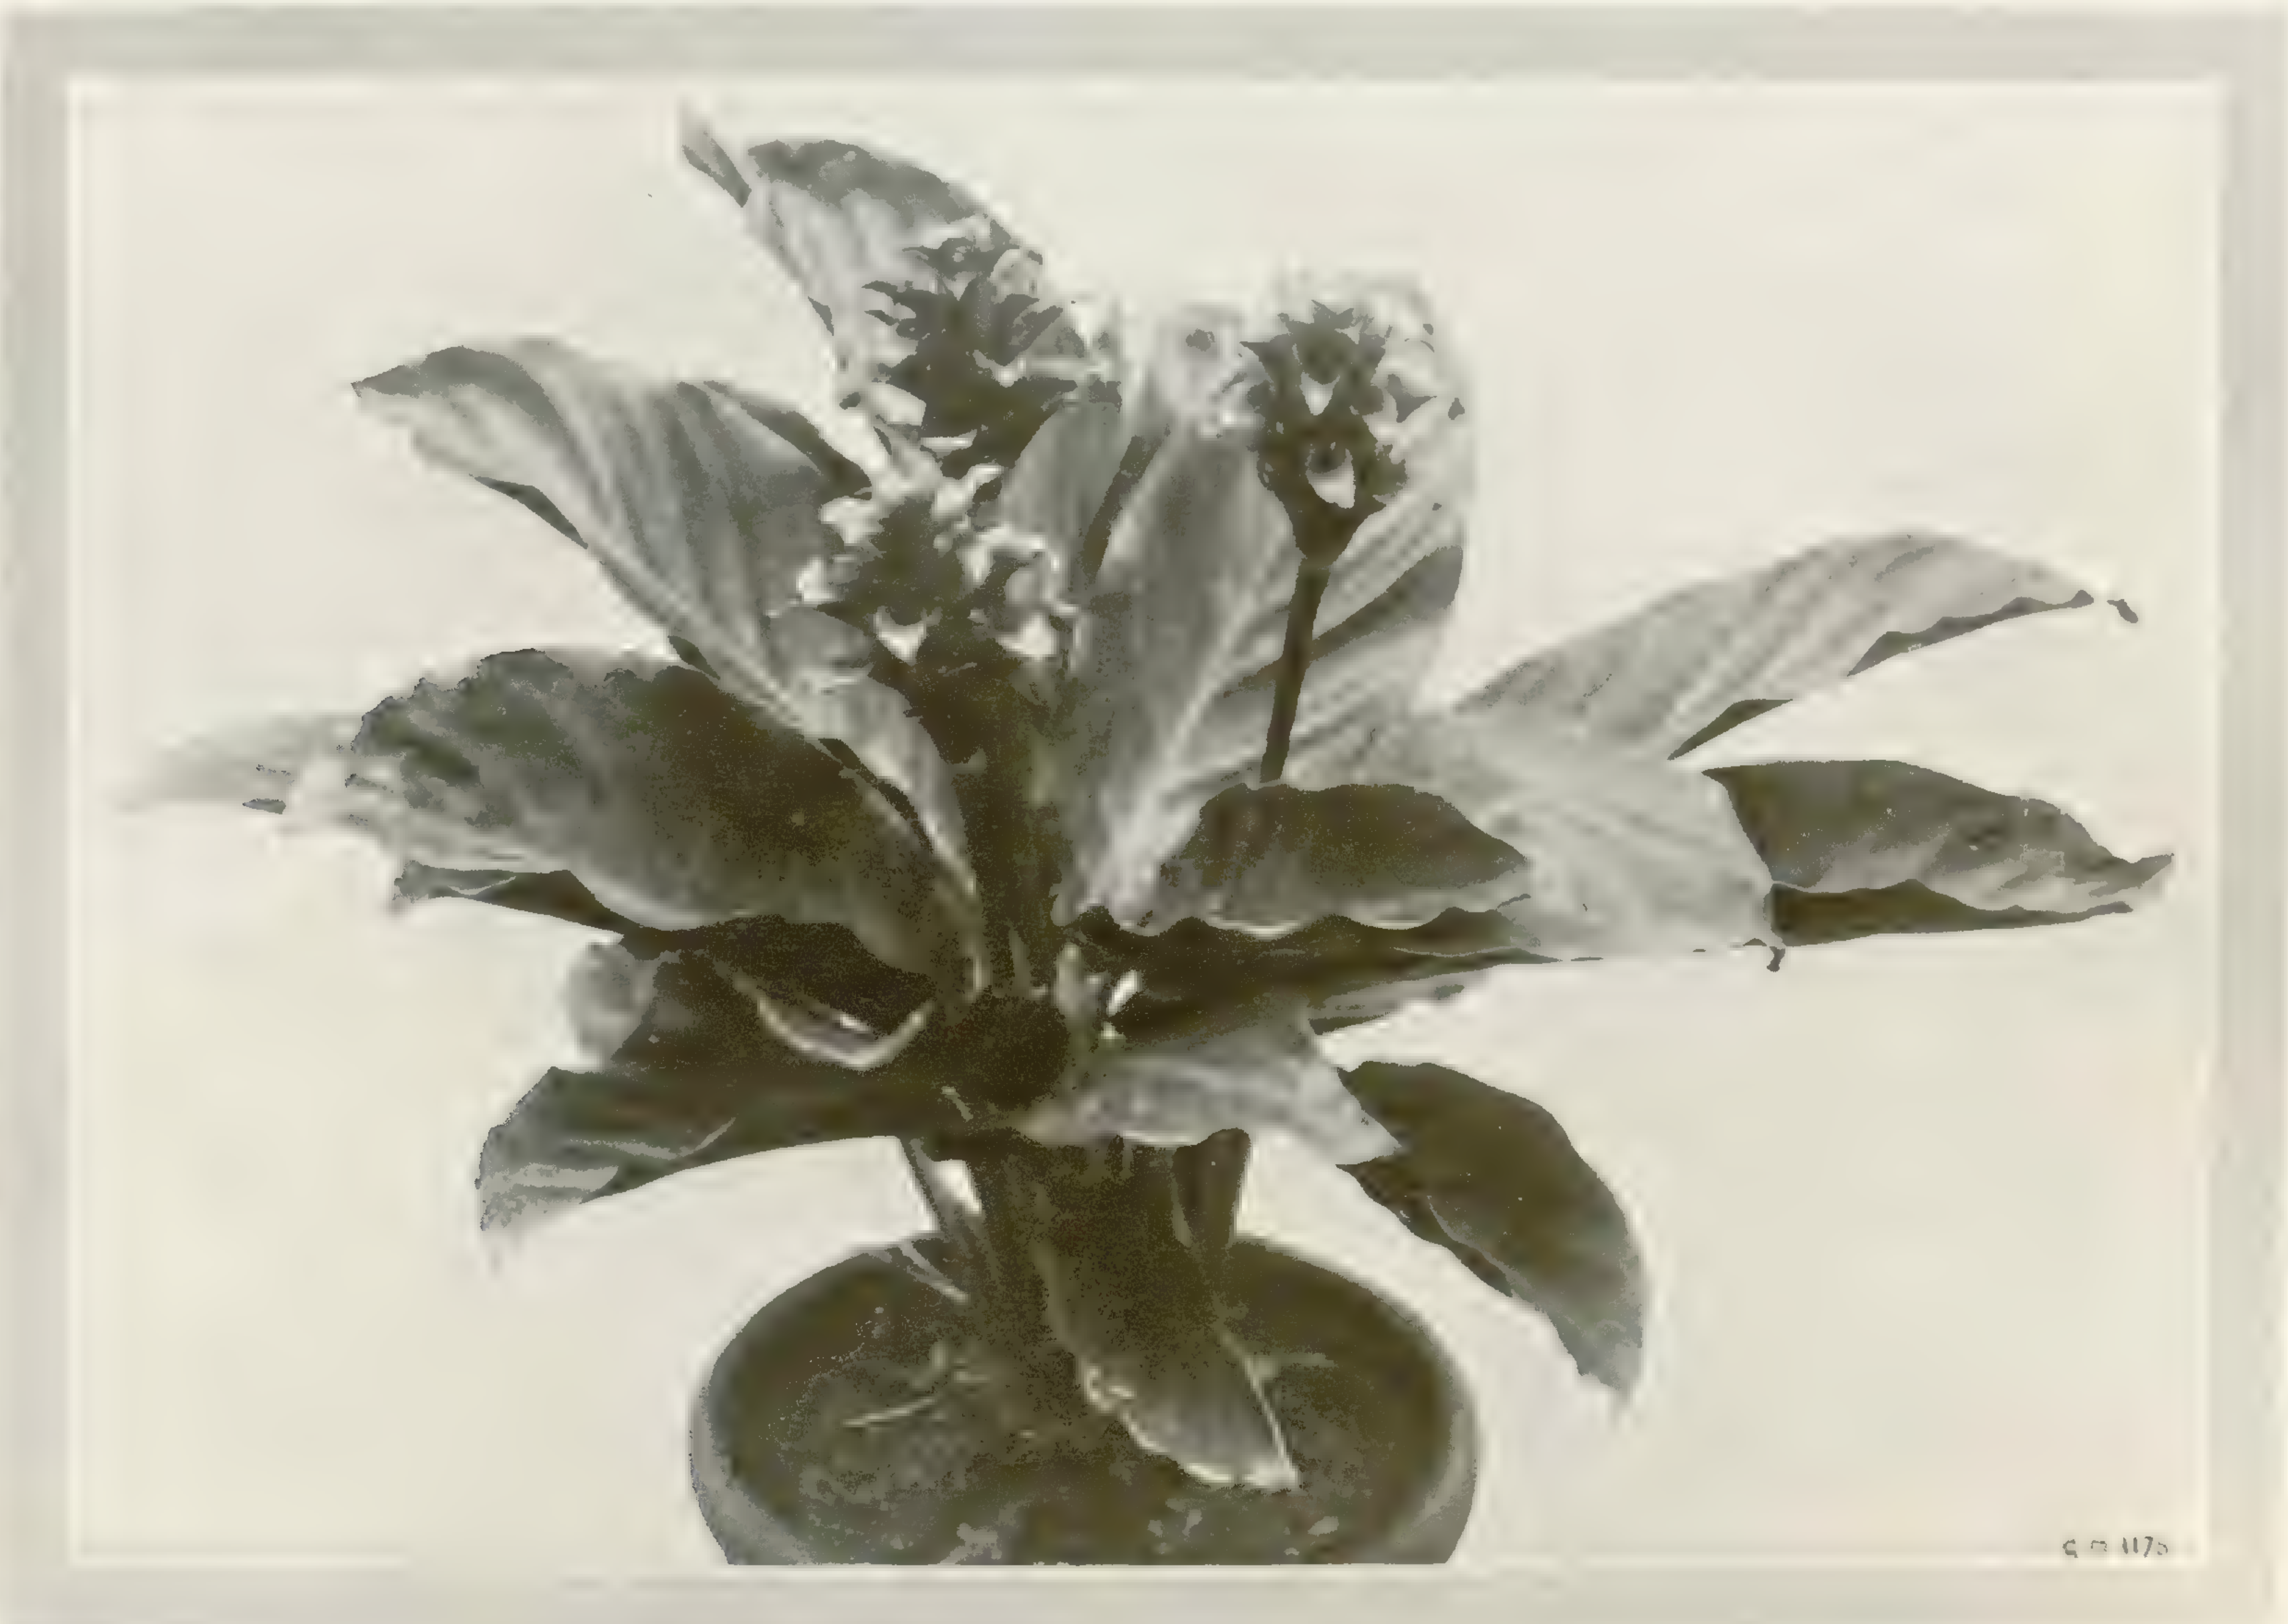
CATTLEYA ROBERT DE WAVRIN WESTONBIRT VAR.

F.C.C., R.H.S., March 22. Lt.-Col. G. Holford, C.V.O. (grower, Mr. H. Alexander), Westonbirt, Tetbury. Flowers rose, bluish-purple, and orange.

Melons.—If plants raised and bedded out as advised, or placed in fruiting pots and treated as cordons, have had their side growths near their base rubbed out as they appeared, and their principal leaves preserved, they should have made a good [illegible] As the leading growths extend secure them to the trellis, and stop them when they [illegible] the desired length; secure the laterals and [illegible] each at one leaf beyond its first fertile blossom, and remove superfluous male flowers. During the flowering time attention should be paid to setting the fruit to secure a [illegible] upon each plant from blossoms that expand nearly at one date. The setting will be accelerated by maintaining a buoyant and moderately-dry atmosphere and careful [illegible] After attending to other routine matters [illegible] the fruit commences to swell top-dress with fresh compost.—T. Coomber

THE ABUSE OF THE PRUNING KNIFE.

Any man who sets out to prune a fruit tree ought to be able to explain why he cuts off each and every shoot that is severed, and also what he expects to get as the result of doing it. I wonder how many people who prune could give these explanations if they were asked to do so, but I am perfectly sure that a number would fail, and I am also of the opinion, which has been arrived at as the result of observation, that more harm is done through too free use, or, shall I say abuse, of the pruning knife than through not using the implement at all. With a number of persons, I will not say professional gardeners who understand the principle of the thing, the idea of pruning is to cut something, and so long as they make a tree appreciably less, and leave a good litter of severed growths and branches on the ground, they flatter themselves that they have done their work efficiently.



CALATHEA CROCATA.

A.M., R.H.S., March 22. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking. Leaves green and purple; bracts orange, flowers yellow.

It is amusing to watch the gardening novice when he goes out to prune his fruit trees, as many do, just at early spring time. With secateurs in hand (the novice, by the way, rarely has a knife sharp enough to prune with), he stands and views the tree, knowing that he must cut something, which is his idea of pruning, and then he begins snipping a bit here and a bit there, getting bolder as he gets warm to the work, and by the time he has finished the tree is trimmed in, neat, shapely, and symmetrical, so far as appearance goes, but if you could make the amateur pruner realise how much fruit, and prospect of fruit, he had cut away in his pruning, he would promptly lock his secateurs away in a secret drawer, and lose the key.

The man who goes about doing odd jobs, who has had a doubtful training, but, somehow or other, has obtained a local reputation for himself as a pruner, sets about his work in a different manner, but there is no hesitation about him. His policy is to cut, and cut he does with a vengeance. He has a certain rule of thumb method of his own, or of the fraternity to which he belongs, and he would scorn to explain any reasons for his severe treatment of the trees. He will tell you with a curl of the lip that that is his way, founded on the experience of having worked in a garden for a certain period in the days gone by under a certain expert gardener, so you may take it or leave it. Why should he give explanations? The idea of such a thing is little less than an insult to his professional ability, and with a final remark, that we always do it like that, he goes on with his cutting.

It is none of my intention here to discuss different methods of pruning, because the man who knows enough about the work to have a method, that is a method, not a rule of thumb process, can always explain why he proceeds in a certain way, and if he gets good crops of fruit as the result of his process you cannot say that he is wrong, even though you may not agree with him. This may be a case of two men arriving at the same place by taking different roads, but so long as they arrive there is nothing to complain about. Among the men of method we have heavy pruners, light pruners, and moderate pruners, but it is the pruner who has no method who spoils fruit trees, and this is the individual I complain about.

Generallly speaking, it is in the early spring of the year that the bulk of the pruning is done, and it is now that one has opportunities of observing the shortcomings of pruners. We have two extremes to consider, i.e., non-pruning on the one hand, and butchery on the other. Let us consider the former first. There are hundreds of young trees in gardens and orchards to-day which want the knife. Some were planted last fall, others have been in a year, and they are furnished with the long young shoots that were made in the nursery prior to their removal. The owner of the trees does not shorten back these shoots, perhaps for the want of confidence, perhaps because he does not know what will happen if he does cut them back, and perhaps he is repelled from the operation owing to a reluctance to pay two or three shillings for his tree and commence by cutting half of it away. Be this as it may, one thing he does want, and that is knowledge, knowledge that the first business of a fruit tree is to grow, and that the initial pruning is done with the object of encouraging growth.

However, instead of being pruned the tree is left as it is, it develops fruit buds at an early stage, flowers, perhaps bears a few little apples straight away, and the owner congratulates himself on the quick fruit-bearing capacities of the tree. But wait, this early fruiting exhausts the energies of the tree, it cannot grow, and in three or four years it has a stunted appearance, and the head is scarcely any bigger than when it was planted. In other words, the tree has begun at the wrong end by fruiting first, instead of growing, and here the non-pruner may learn his lesson, i.e., that the first duty of a fruit tree is to grow, and we prune it so that it may be able to perform that duty. Let experts argue to their hearts' content as to whether a tree should be pruned at the time of planting or a year later. I disagree with the advocates of neither system, but the man we want to convert is he who never prunes his newly-planted trees at all. With the tree started into growth, however, and the head nicely formed, the system of pruning is dependent on the conditions under which the specimen is growing, but, in the name of all that is reasonable, let abuse of the knife be avoided.

It not infrequently comes about that severe pruning is the means adopted for avoiding the evils of too close planting. It happens in this way. A man lays out his garden and arranges the fruit quarter, but he overlooks the fact that the trees will grow. At first the nice little specimens, fresh from the nursery, look fine with a few feet between them, and if they could be kept at that all would be well, but Nature asserts herself, and the trees grow. They at first fill up the space allotted to them, and then begin to overcrowd each other, to the dismay of the owner, who has not bargained for this, and he prunes as a means of keeping the trees in their places, but it is all to no purpose. The natural result of pruning is growth, and the harder the trees are cut the harder they grow, with the result that eventually the nicely arranged fruit plot is a mere thicket of overcrowded trees but very little fruit. The lesson is obvious. When planting trees give them room to grow, and if severe pruning is necessary in order to keep them within certain desired limits, keep the balance level between roots and branches by periodically lifting the trees or pruning the roots.

Now let us turn to another picture. In a villa garden near at hand there is a number of fairly big trees, bushes, pyramids, and espaliers, and a week or two ago the tops of them represented so many whips, but, in the meantime, the local pruner, a rule of thumb man, has been round. He has cut every one of these young growths made last summer close back to the branches, treating the leaders just the same as the side shoots, and the trees now look something like those little toy specimens that one sees in children's Noah's arks. By July these trees will again be dense masses of young leaf-covered shoots. Next winter the bare whips will be there again, but stronger and more numerous than before, and next spring the hacking-back process will be gone through once more, just in the old sweet way, but I would not give much for the fruit that is produced in the meantime. This is abuse of the pruning knife, and if the owner of the trees would only discharge his pruner, thin out the wood in the trees, and let them grow, he would get some fruit, but he will never do this so long as the present routine process is followed up. Of course, if the owner of the garden were growing grafts for a nurserymen or stakes for a carnation grower he could not go on better lines, but he planted the apples and pears to grow fruit, and nothing is produced but wood.

This is not an imaginary picture, but a true state of affairs which exists in dozens of gardens where the pruning is done in such an ultra-severe rule of thumb way that the object of the operation, i.e., the production of fruit, which is the end and aim of planting trees, is apparently lost sight of. G. H. H.

Ideal Home Exhibition.—As most of our readers are no doubt aware, the Ideal Home Exhibition is to be opened at Olympia, Kensington, next Friday (April 8). The Gardeners' Magazine will be represented, and all readers visiting the exhibition are invited to pay our stand a visit. All our books and publications will be on view, and can be freely inspected by those desirous of making their acquaintance. The exhibition will last from April 8 to 23.

THE VALUE OF SHELTER.

Locality, soil, and climate are of immense consequence in a garden undoubtedly, but a great deal can be done to overcome any deficiencies in neighbourhood and atmospheric conditions by the establishment of sufficient shelter for various plants. This branch of the gardening art has been marvellously neglected, considering that by its study and exercise we are enabled to cultivate semi-hardy subjects to perfection, and also to foster innumerable delicate beauties of the floral world that are unfamiliar.

Our ancestors laboured more zealously than we to guard roses and other favourites from cold blasts, but we are foolishly disposed nowadays to ridicule their prim hedges of dark monotonous evergreens. It would be better if we copied their example, but employed better tools: yews and box clipped into the shapes of globes, pillars, vases, birds, and beasts may be inartistic, and only to be imitated for the production of quaint old-world effects, but the protection they afforded to portions of pleasure-grounds was in most cases probably the main object of their creation.

South walls are usually taken advantage of for enabling less hardy climbers to be grown, and the borders in front of them are used for tender bulbous and bedding plants, with a few shrubs, such as laurustinus, myrtle, and hydrangea, but there are easy and valuable ways of increasing the geniality even of these walls and borders. A south aspect means side aspects of west and east; the winds from the former often do much damage to flower and foliage during winter, accompanied as they are by violent rainfalls; the east winds of spring are dreaded for their withering propensities. Now by planting groups or short hedges of evergreen shrubs, jutting out from the wall, either only at the two ends, or at irregular intervals along its whole length, we may gain nooks that are always many degrees warmer than the unprotected border would be, and at the feet of these shrubs countless lovely dwarf plants will find a fitting home.

Where the belts of shrubs can be broad they can be so arranged that the centre mass of aucubas, euonymus, privet, rhododendron can be clustered against by shrubs that are themselves far from hardy, by which method we shall be enabled to find room for such beautiful things as Fuchsia myrtifolia, Forsythia viridissima, Cydonia or Pyrus Sargenti, Coronilla emerus, Cistus formosa, Benthamia fragifera, Ghent azaleas, Abutilon vitifolium, and Veronicas newryensis and pinguifolia. Almost beneath the shrubs' branches collections of crocus species, Dog's Tooth violets, colchicums, etc., may give welcome colour.

To prevent monotony of effect a jutting-out length of trellis may be placed in similar position: this will aid in forming yet another of the baylike recesses against the south wall, and offer a support for two or more climbing roses and clematises. If the lowest portion of the erection is of close woodwork, the shelter on the border level will be yet more perfect. Against it, on the warmer side, would be a fine position for ixias, sparaxis, babianas, crinums, amaryllis, and a whole host of other lovely bulbous flowers.

A length of low wall, made in imitation of a ruined wall, affording plentiful pockets and chinks, in which sedums, saxifrages, helianthemums, erysimums, sempervivums, androsaces, etc., would thrive would be another excellent kind of shelter. In a nook between a west wall and a conservatory, climbing the base wall facing due south, the glorious Maréchal Niel rose will flourish even in the North of England, and the blossoms gained prove finer because richer in colour, and more stable of petal, than any to be gathered from this variety under glass.

There are frequently warm sites against kitchen garden walls which, if sheltered at the sides, would enable exceptionally early fruit to be gathered in front of the trees, a position being offered suitable for the planting of Roman hyacinths, Polyanthus narcissi, and other bulbs for the supply of cut blossom for the house long before other collections of identical species would be ready. Polyanthuses, primroses, oxlips, cowslips, are amazingly early, too, in such nooks, the same plants being floriferous year after year if removed to cool borders for summer, and divided and returned to the warm quarters each autumn. Dicentra spectabilis is another plant that can be subjected to this natural sort of open-air forcing.

The backs or sides of summer-houses often are admirable shelters to the borders against them. This can be intensified, where the nature of the building permits, by the erection of a miniature verandah of bamboo poles and wooden top, around the roof ledge. Christmas roses, for example, gain from this the shelter from the elements that was needed to preserve the purity of their waxen petals, and if hepaticas, one or two of the earliest rhododendron species, Pyrus japonica in pink and blush white, as well as red, yellow jasmine, Daphne mezereum, winter-blooming irises, Anemone fulgens, yellow aconite, snowdrops, Van Thol tulips, crocuses, Lent lilies, and Lenten roses, be added as well to the border, the flower show will be a joy for many of the dreariest months of the year.

A semicircle of evergreen shrubs will most effectually shelter a large round bed on an exposed lawn enabling spring bulbs, and afterwards tea roses, to be grown in a position in which otherwise they would not be possible. A similar shrub arrangement on a larger scale in the fruit garden will ensure a supply of wondrously early green gooseberries, strawberries, French beans, parsley, mint, etc.

In the flower garden great pleasure is derived from the use of less common evergreens, flowering and fruiting ones especially. Among attractive species and varieties that are too often forgotten are Phillyrea decora, thick-leaved, dark green; Osmanthus aquifolius, somewhat resembling holly, and its purple-leaved relative, Osmanthus ilicifolius purpureus; Euonymus Bungeanus, noteworthy for its fruits; Cassinia fulvida, gold-foliaged and white blossomed; Bupleurum fruticosum, a robust yellow bloomer; the shining dark Baccharis patagonica; Thuja orientalis compacta pyramidalis, bronze-hued in winter; Cornus sibirica, the Scarlet Dogwood, and Carpentaria californica, with its fragrant white flowers.

Less complete shelter is afforded, of course, by groups or hedges of Rugosa roses, the Snowberry Tree that is so charming in spring leaf, summer bloom, and winter berry, lilacs, broom, Spiræa ariæfolia, Philadelphus coronarius, Viburnum opulus, and deutzias. M. H.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

CONSERVATORY AND GREENHOUSE.

PLUMBAGO ROSEA COCCINEA.—This useful variety of an old and well-known plant is not cultivated so extensively as its merits deserve, especially remembering that it will flower during the whole of the winter months. It possesses a free, branching habit, and produces long panicles or sprays of flowers admirably adapted for table decoration, and although these do not long remain fresh when in a cut state, the freedom with which they are produced ensures an abundance. Cuttings should be secured at once, and are best taken from the young growth; but if large plants are required the old plants may be repotted. In the latter case remove a portion of the old soil and cut away some of the strongest roots. The growths should be trained to stakes during the summer months, and the plants be given a position in an intermediate house.

A LARGE COLLECTION OF SPLENDIDLY GROWN HYACINTHS IN PANS, HAARLEM JUBILEE FLOWER SHOW.
Exhibited by Messrs. Ant. Roozen and Son, Overveen, Haarlem.

RICHARDIAS.—Plants that have finished flowering should, providing the weather is mild, be placed out of doors in the full sunshine, and at the same time have the supply of water at the roots gradually reduced, so as to thoroughly ripen the growth. If the plants are to be kept in their pots they should be placed on their side until growth starts again about July.

SOLANUMS.—Plants raised from seed last year should be repotted, and afterwards pruned hard back and grown in a warm house, keeping them moist while growing. When the weather is favourable remove them to a frame for the summer months, and never allow them to want for water.

ROSE HOUSE.—Established rose trees in borders will now be growing freely, and a good soaking of tepid liquid manure will be found beneficial to them. Syringe freely with clear water once or twice daily, according to the outside conditions. A slight fumigation once a week will keep down attacks of greenfly. Roses in pots should also be assisted by liquid manure. A fresh batch of roses should be brought into heat to furnish a succession, and roses will be found very useful now that forced plants are passing out of bloom. The night temperature should be 45 to 50 deg., with a proportionate rise by day, giving ventilation on all favourable occasions, but avoiding cold draughts.

BORDER CARNATIONS IN POTS.—Where a batch of these have been wintered in cool frames, and the plants have not been already shifted into 7in. or 8in. pots, let this be done without delay. Use good loam, leaf-mould, sand, and old lime rubble. Pot firmly, and after making the plants secure to stakes, place them on a bed of ashes in a sheltered position out of doors. Though border carnations are usually grown quite successfully in the open border, it is a good plan to have a batch in pots for greenhouse or conservatory decoration, and especially is this advisable if blooms of extra size and quality are wanted for exhibition, or it is desirable to test newer varieties. The plants may be removed indoors just before the buds begin to burst.

SHADING.—At this time of the year the sun is often so bright that it is dangerous to expose the plants to its full power, as the foliage of some tender plants is liable to receive injury in a short time. A thin mixture of whiting and sour milk makes a good shading for a few weeks, when it may be removed and the blinds be fixed for the summer.—W. Staward, Belford Hall Gardens.

THE ORCHID HOUSES.

CALANTHES.—In the cultivation of calanthes I am convinced that no hard and fast rule can be laid down for application to every situation in which these plants are grown. There is an orthodox method which may be applied generally, with varying success, but as in many other cases we meet with in plant cultivation, one cannot successfully grow certain plants in one place by the same methods that we have found eminently successful in another. The situations vary so much that it is absolutely necessary we should make ourselves perfectly familiar with the conditions, and so adapt ourselves to local circumstances. It is only by repeated trial we are enabled to provide the conditions and material most suitable to meet the requirements of the case.

POTTING COMPOSTS.—I am putting this plainly because I do not wish to convey that the conditions under which we have been able to successfully grow our plants must of necessity be the correct system. I have produced some of the finest calanthes I have ever grown with nothing more than turfy loam and sand, and the plants showed no sign of the dreaded spot. When I first took charge of the collection here I used what most growers would consider the proper compost, i.e., turfy loam, fibrous peat, chopped sphagnum, some dried cow manure, coarse sand, and broken crocks. For the first season or two we had a fair amount of success. It was then decided that more turfy loam should be added. The first season gave us every encouragement until the new pseudo-bulbs commenced to form. The foliage then showed tiny white specks, which in due course showed the breaking up of the tissues, and finally the plants were almost ruined by the disfiguring black spot. A portion of the plants and those that had the previous year been badly affected were selected for treatment in a lighter and more open compost of osmunda fibre, peat, and a little chopped sphagnum and broken crocks, and the result was so satisfactory that for the last two or three seasons nothing has been used but the light, open compost, and, notwithstanding the bad summer and unfa vourable autumn, our calanthes have never been so fine as they were this winter. I give these experiences as an object-lesson to those in charge of plants. As the time has now arrived when the various species and hybrids will require repotting I would certainly advise that loam should be altogether omitted from the compost where there has been any difficulty experienced from spotting, and a good open and porous one be tried on some of the plants, at least for a season.—H. J. CHAPMAN, Oakwood Gardens.

THE FLOWER GARDEN.

EARLY-FLOWERING CHRYSANTHEMUMS are quite indispensable as autumn-flowering plants, and are very effective either in masses or mixed borders. Plants that were raised in the autumn or early during the present year should be kept growing, so as to receive no check before being planted out at the end of this month or early in May. If obtainable, cuttings of these may yet be struck, and if given the benefit of a little gentle heat these will furnish small, but useful flowering plants. Remove the growing point from time to time, as the season advances, but stopping should be discontinued soon after midsummer, or early in July at the latest.

A MAGNIFICENT VASE OF LILAC MARIE LEGRAYE, HAARLEM JUBILEE FLOWER SHOW.

Exhibited by Messrs. D. and J. Keessen Bros., Aalsmeer.

PENTSTEMONS, ANTIRRHINUMS, gaillardias, coreopsis, and similar plants that were raised in the autumn may now be planted in their permanent quarters. Half-hardy annuals, such as alyssum, Bartonia aurea, calliopsis, candytuft, centaureas, clarkias, godetias, larkspurs, lupins, malvas, mignonette, poppies, etc., should soon be sown in borders or beds. The soil for these should be levelled, and raked down before sowing. Sow thinly, and then cover well with light, fine soil. Where birds are troublesome and newly-sown seeds always attract them it is safer to cover the beds or borders with mats until the seedlings are breaking through the ground. Annuals intended solely for cutting purposes are better sown in rows, as thinning and weeding can be done much more easily than when sown broadcast. Sweet peas that are coming through the ground should be protected from birds by netting or wire pea guards. If attacked by slugs dust the soil around them with soot or lime; an early mulching of half-decayed manure is advisable as a protection against hot sun or drying winds.

GLADIOLI may now be planted, providing the ground is in a suitable condition, placing the corms at a depth of three or four inches, and ten or twelve inches apart in the rows. On light, dry soils mulch the surface of the borders with leaf-soil or half-decayed manure as soon as planting is completed.

GENERAL WORK.—With the advent of April showers, or suitable atmospheric conditions, the transplanting of evergreens may take place. Most of these can be moved safely just before growth commences. Hollies, if carefully lifted, seldom fail at this season of the year, or even later. To ensure success, everything should be in readiness before lifting commences, as it is highly important to keep the roots from exposure. After the trees have been placed in position, and filling in commences, it is necessary to see that no cavities exist under or near the roots, and it is the practice of some to well water before the final filling in and levelling down of the soil takes place; this quite prevents any vacant spaces, and gives the plant a quick start. In exposed places all trees should be securely staked to prevent root disturbance during high winds. It is now getting late for laying turf unless one has a good supply of water and labour, but the present is an excellent time for sowing grass seeds, and in this way patchy or bare places on the lawns can be renewed; the seed should be lightly covered with a dressing of fine soil, and be then well rolled. Attention to watering should be given from time to time, according to the state of the weather, for at no stage of germination should the soil be allowed to become dry, or failure will be swift and sure. Where moss is prevalent, and is objectionable, a good dressing of lime, with subsequent rakings, will do much to improve the surface of the lawn.—W. HEDLEY WARREN, Aston Clinton Gardens.

HARDY FRUITS.

HOEING.—The drying winds and bright sunshine that have prevailed generally for the past ten days have been the means of bringing the surface soil in fruit plantations into a splendid condition for the use of the Dutch hoe, which should be freely used on all favourable occasions. Hoeing is not only detrimental to the growth of weeds, but it also checks rapid evaporation, and conserves the moisture in and around the roots of all fruit trees; it also materially assists the sun rays to penetrate and warm the soil. It should be borne in mind that constant hoeing is one of the great secrets of successful fruit growing.

MULCHING.—The work of mulching fruit trees in the open quarters should be deferred for some weeks yet, to allow the sun to warm the soil, which is so essential to promote healthy root action, and also to ascertain whether or not the individual trees will bear heavy crops. At this season of the year applications of wood ashes, soot, and lime, are very beneficial to all kinds of fruit trees, if it is lightly stirred in with the Dutch hoe after it has been applied. The borders of fruit trees growing on south and west walls should be mulched with long stable little, as where fruit blossoms have to be protected with netting or blinds, the litter prevents the soil from becoming too hard upon the surface when frequently walked upon. If mulching is not used, boards of a convenient length and width should be utilised for the same purpose. Where peaches, nectarines and apricots are grown on south walls, the borders should be examined, and if the soil is dry a good soaking of clean water should be given, choosing a bright, sunny day for the work.

GENERAL WORK.—Finish as soon as possible the grafting of all apple and pear trees; where clay has been used when grafting, it should be examined and kept moist, as it often happens when we experience a spell of cold, drying winds that the clay becomes cracked, and in all probability drops off, if attention is not paid to maintain that degree of moisture which makes it adhesive to both stock and scion. Where grafting wax is used this trouble is not experienced. Pay particular attention to wall trees in flower, taking care that the materials used do not produce by their warmth tender and weakly growths; hence the necessity of removing the materials upon all favourable occasions, as advised in the last calendar.

THE FRUIT ROOM.—All remaining fruits should be carefully looked over and the decayed ones removed; any specimens that show the least speck of decay should be immediately used for cooking purposes. All shelves that contain no fruit should be well cleaned and the fruit room kept as cool and sweet as possible.—HENRY FARMER, Cardiff Castle Gardens.

LAWNS.—Those who desire to make a new lawn or bowling green, or to renovate and maintain existing ones in good condition, can have no better guide than "LAWNS AND GREENS," by T. W. Sanders, price 1s. net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

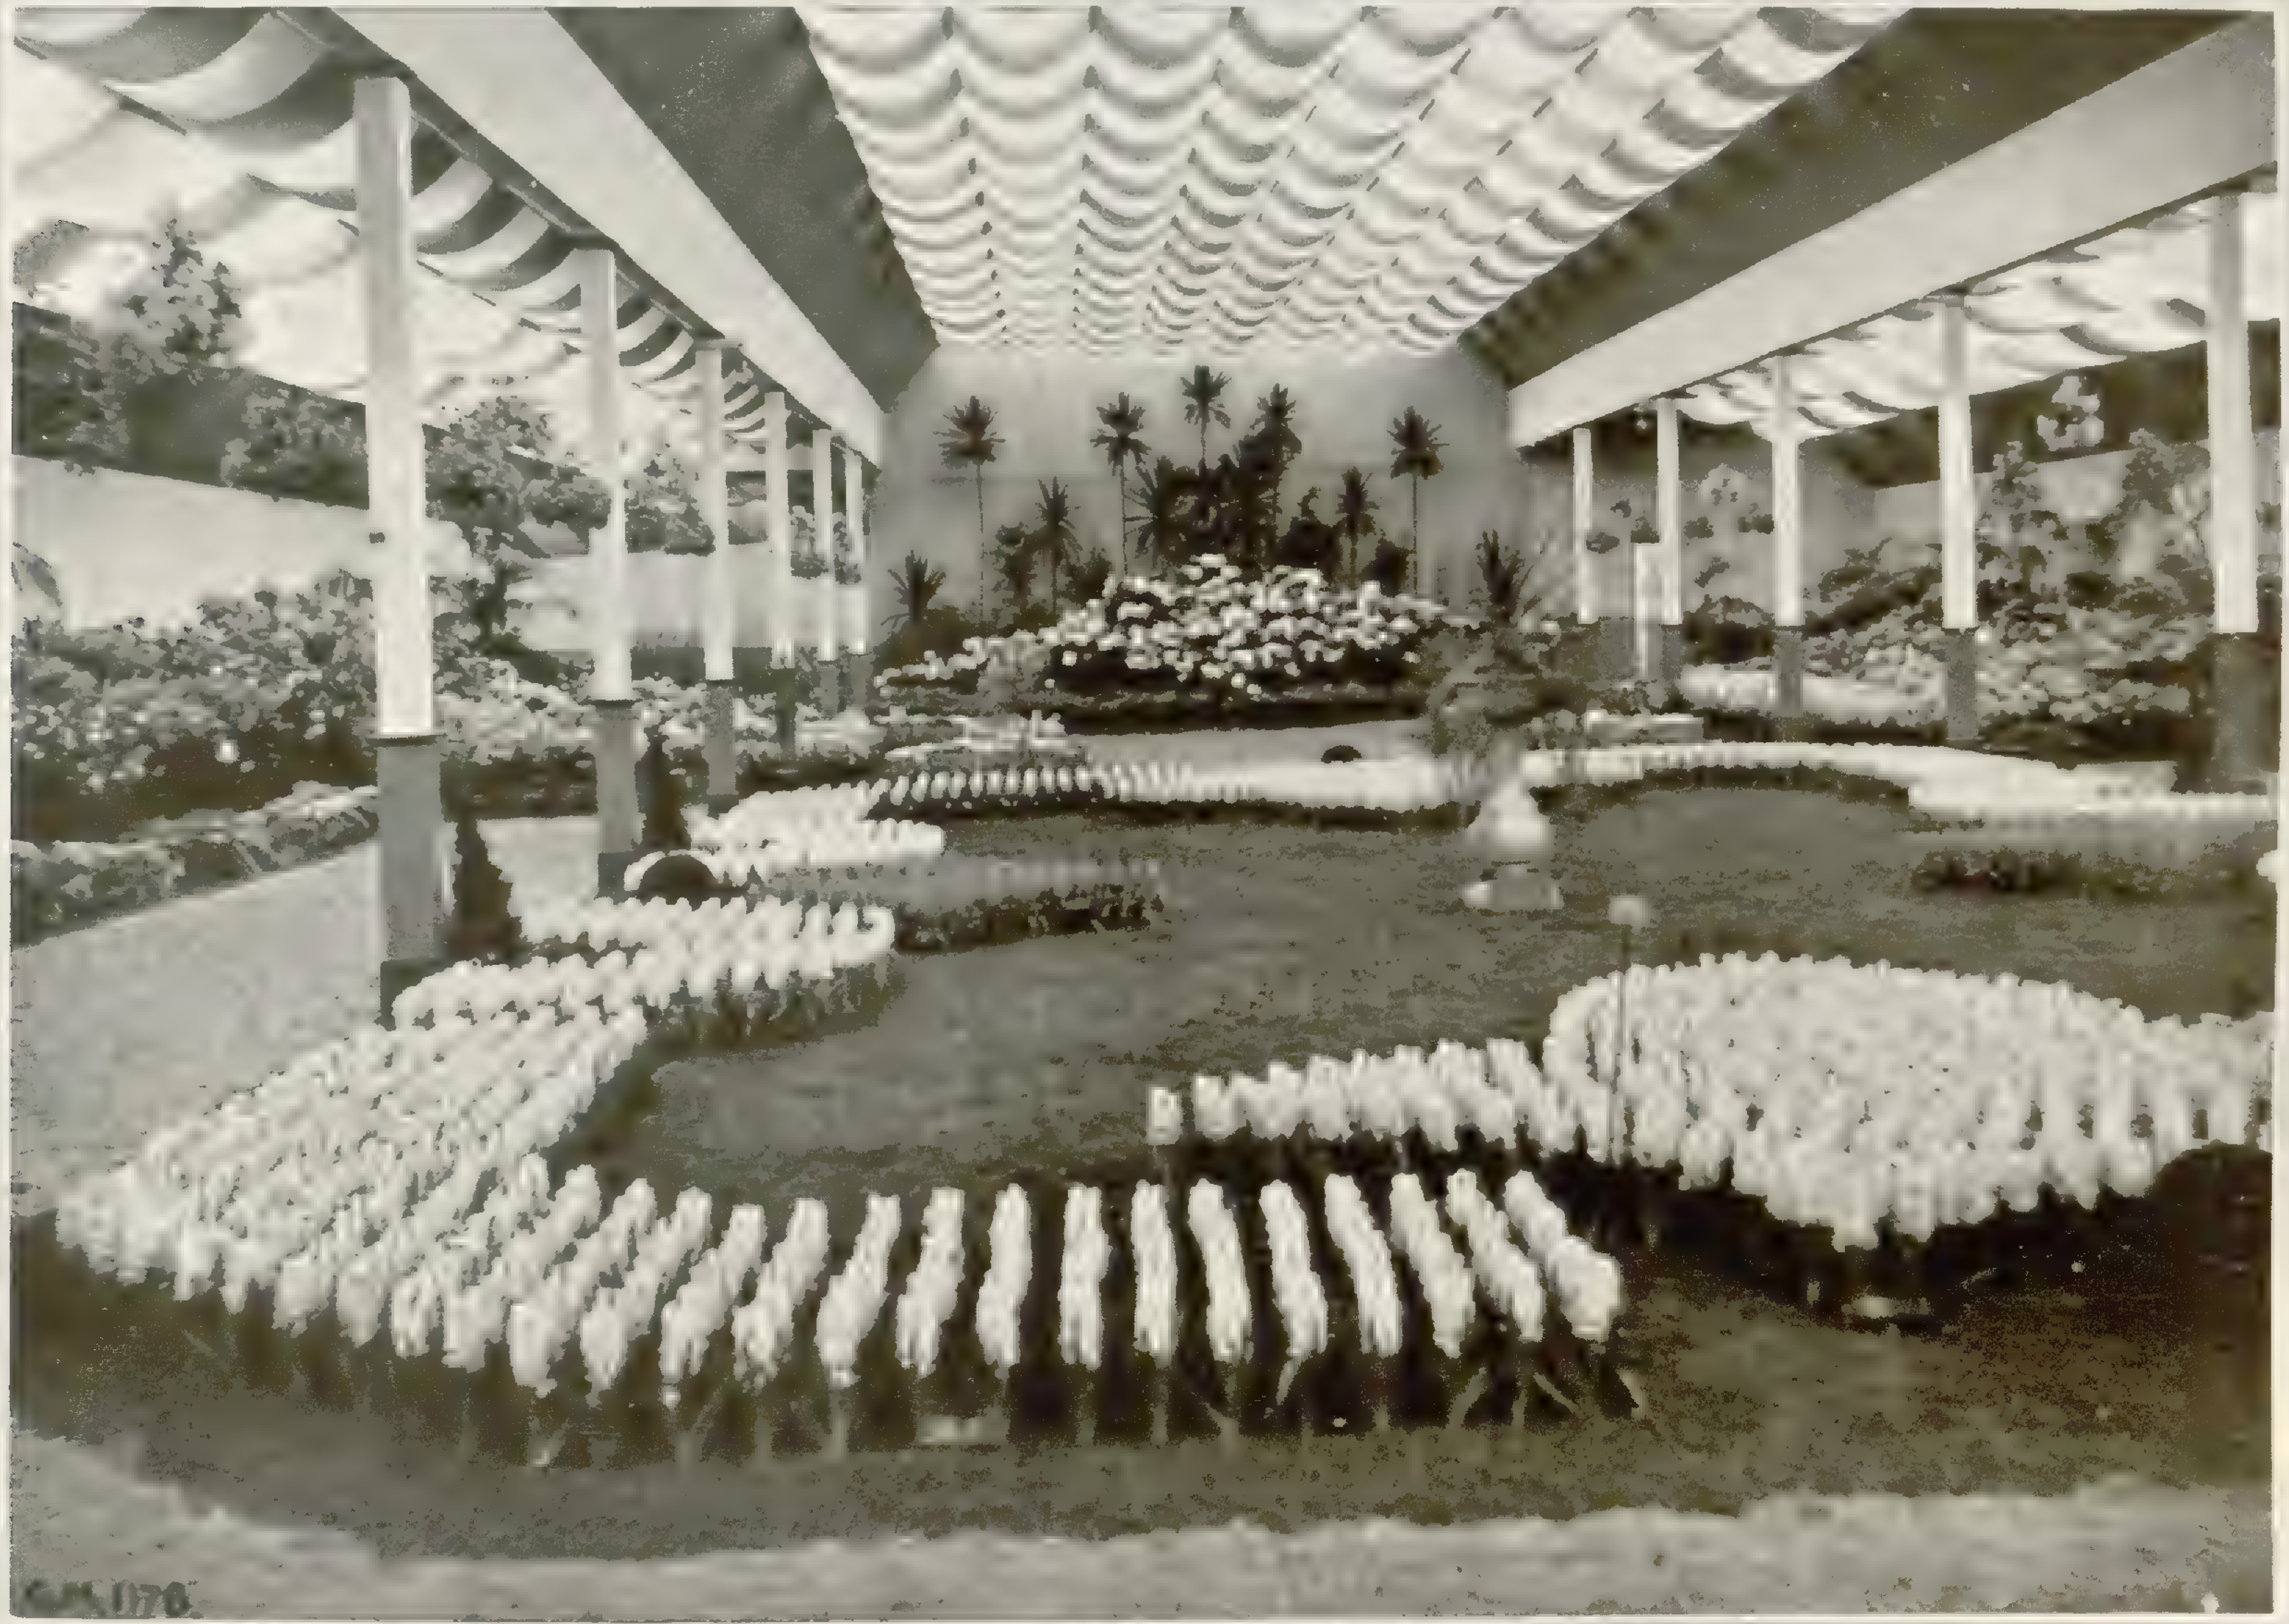
HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Jubilee Flower Show, Haarlem.

Flower shows of a comprehensive character, when carried out in accordance with a well-devised scheme, are invariably interesting, and seldom fail to prove more or less instructive to those engaged in horticultural pursuits. If this be true of competitive gatherings held in districts in which they are of frequent occurrence, it is doubly so in the case of the great jubilee flower show that was opened with befitting ceremony at Haarlem on March 23. This city has for at least three centuries been closely associated with the bulb-growing industry that forms so important a part of the industrial activity of Holland; and by common consent the exhibition is the most extensive, interesting, and attractive of the displays that have been produced by the endeavours of the horticulturists in the district of which Haarlem is the centre. The justification of the endeavour that has been made to surpass all previous efforts is the attainment of the jubilee of the General Bulb Growers' Society, which has exercised an immense influence for good upon the cultivation of hardy bulbous plants throughout Holland during the past fifty years. The practice of this society since its inception has been to hold an exhibition annually, and to so extend the scope of every fifth show as to make it of sufficient importance to justify the awards being made by an international jury consisting of the leading authorities from the various centres of horticultural activity in Europe. The forthcoming jubilee was much discussed at the great exhibition held by the society at Haarlem in 1905, and the immense advance shown by that gathering upon previous endeavours justified the anticipation that the jubilee celebration would be worthy of the occasion, and this we have much pleasure in stating has been fully realised, if not greatly surpassed.



AN EFFECTIVE ARRANGEMENT OF HYACINTHS, HAARLEM JUBILEE FLOWER SHOW.
Exhibited by the General Bulb Company, Overveen, Haarlem.

The society has been exceptionally fortunate in obtaining for the purpose of its jubilee show a portion of the Hertekamp Park, with an area of about twenty acres, and finely wooded, delightfully undulating, and convenient of access. The distance from the city is about a mile, and as there is a frequent service of tram cars to the park gates, it can be covered cheaply and expeditiously, and it may be added pleasantly, for the road passes for some portion of its length through a magnificent avenue of trees. This part of the park is oblong, and it has a broad vista on the western side, which extends its whole length, and a building at either end, the stately edifice known as the Museum of Art at the northern termination being the most important. In the northern part of the area have been erected the four buildings for the display of the plants contributed to the temporary exhibitions, of which this was the first. These buildings are spacious and substantially built, yet are elegant in appearance, and with the aid of fine canvas suspended from the roof, as so well shown in the accompanying illustrations, the light was so well controlled that the plants and cut flowers had light enough, and no more, to show their distinctive colouring to the best advantage. Within these structures the various subjects, for which provisions were made in the 273 classes that had a place in the schedule, were accommodated. Need it be said that hyacinths and tulips were given the prominence their importance demanded, or that they were well represented. Hardy azaleas and rhododendrons in variety were largely shown, and lilacs, both plants and cut flowers, were contributed in the most liberal manner, and were in exceptionally fine condition, the plants throughout being remarkable for the development of their spikes and the colour of the flowers; while the cut spikes were equally meritorious. The appearance of the finer specimens suggested they had enjoyed rather more light and air than is given lilacs in this country when being forced into bloom. Primula obconica was largely shown, and in some of the collections the high-coloured varieties were especially attractive.

The permanent exhibition which is being held in the open will be more attractive on the occasion of the temporary show arranged for April 15—24, as the hyacinths should then be in full bloom, and a considerable proportion of the early flowering tulips be yielding freely of their attractive colours. These are for the most part arranged in groups of beds on either side of the vista that extends from north to south, and, as the bulbs have been planted closer than is usually considered desirable in this country, the number must be enormous, and the possibilities great of the display being highly effective. Practically the greater part of the area will be a hyacinth and tulip garden, as the larger proportion of the space under the trees as well as in the open is occupied by groups of beds devoted to these flowers. There are also large numbers of beds devoted to them in the north-west part of the park. The display of tulips should be of special interest for the opportunity it will afford for determining the relative merits of varieties for garden decoration. The number of varieties is very large, and, with a few exceptions, the beds are of average size, or, in other words, range from six to nine feet in diameter when circular, beds of other shapes being proportionately large.

Crocuses have also been planted largely in the geometrical garden formed immediately in front of the Art Museum, and near the western end of the principal exhibition house; these are arranged in beds and borders, mostly the latter, on the fine breadths of turf that form so characteristic a feature of the geometric gardens, and as they were in perfection during the temporary show, they were a source of great attraction to visitors. Conspicuous among the many fine varieties represented are the rich purple Agnes Maria, the bright blue Albion, the pure white King of the Whites, which is so good as to fully justify its title, the bright lilac Maximillian, and the golden Mammoth or Large Yellow. These have mostly a place in English catalogues of bulbs, and those who are desirous to have the best of these as of other good things should take down their catalogues, mark the names, and place them where they are not likely to be forgotten when the bulb orders are made out next autumn.

The topiary art is strongly represented, as might have been expected, by those who are acquainted with the attention that has now for some years past been devoted to the production of clipped trees in Holland. These trees are not, however, overdone, and they have been so associated with other subjects as to suggest that they form part of the general scheme rather than as a demonstration of the activities of exhibitors who make a speciality of them. The trees evince a considerable diversity of form, some representing crowns of considerable proportions, teapots, jugs, vases, anchors, and birds of various kinds. The most interesting of the contributions relating to the topiary art is the group of trees representing the characters in the play of "The Chantecler," which created so much interest in Paris a short time since. Enclosed within a boundary formed with Irish yews is a farmyard, in which are representations of Le Chantecler, La Vieille Poule, La Poule Noire, La Poule Mère, Le Jeune Coq, Le Dindon, L'Oie, Le Merle, Le Canard, La Cigne, La Faisane; Buiffaut and Paton, two dogs; a wheelbarrow, and two or three structures proper to the farmyard It may here be mentioned that coniferous trees and evergreen shrubs that have been grown without the aid of shears have also been freely used in enhancing the attractions of the park, and these are mostly arranged in bold groups under the trees and on the rocky banks of the stream that intersects the park, and as a background to a considerable number of the groups of beds devoted to bulbous plants. They are all more or less attractive at the present time, but they will be especially useful as a relief to the glowing colours of the hyacinths and tulips when their flowers attain their full development.

The grounds have, for the purpose of the exhibition, been laid out by Mr. Leonard A. Springer, a landscape architect of repute resident at Haarlem. The exhibition buildings, the geometric garden, and the arrangement of the groups of beds filled with bulbs are all from his designs. Mr. Springer arranged in the Art Museum an exhibition of drawings and plans of gardens that have been famous in Holland and adjacent countries during the past three centuries.

TEMPORARY EXHIBITION.

The temporary exhibition was opened on March 23, in the "Vereeniging" building in the city, but the international jury had assembled early in the morning of the previous day, and made their awards to the various contributions to the classes provided on this occasion. The members of the jury met in the Art Museum, which was for some time the residence of Louis Napoleon, and here they were welcomed by Mr. Krelage, the president of the society. Mr. Krelage did not speak at such length as is customary on such occasions at Continental gatherings, but he welcomed the Dutch, English, German, and French members in separate speeches, a departure from the usual practice that was much appreciated. On the completion of their duties the members of the jury were entertained at luncheon in the exhibition restaurant, and at this function there were two speeches, the speakers being the President and the Burgomaster of Haarlem. In the evening of the same day the council of the Dutch Bulb Exporters' Association received the jury at a friendly gathering, and here also the speeches were but two, one by the president of the association and the other by the President of Honour of the jury. The opening ceremony, on the 23rd ult., was at a quarter to eleven, and at this H.R.H. the Prince Henry of the Netherlands was present, and of the English members of the jury, Mr. G. H. Cuthbert, Mr. George Gordon, V.M.H., and Mr. J. F. McHattie had the honour of being presented to him. The social functions were brought to a close with a banquet at Funckler's Hotel. At this, as at the luncheon, Mr. Krelage presided, and he was supported by all the leading statesmen in Holland, the Burgomaster of Haarlem and others occupying prominent positions. The banquet was a brilliant success, although probably some of our English friends may have considered the after-dinner proceedings rather too lengthy. There were twenty-one speeches, some of them occupying over twenty minutes, but they were, for the most part, of a high average, that of the President being exceptionally so. Unlike the public dinners in England, the toast lists at festive gatherings in Holland are not interspersed with either vocal or instrumental music. Mr. J. F. McHattie made an interesting speech in response to the toast of "The Jury," and Mr. Van Waveren, who has been a member of the society since its foundation fifty years ago, made a speech at once interesting and vigorous.

BULBOUS PLANTS.

As might well have been expected in the great centre of the hyacinth industry, hyacinths were splendidly shown both as regards numbers and the development of flowers and foliage. They contributed liberally to the attractions of each of the exhibition houses. In the first of these the General Bulb Company of Overveen had a magnificent display which received much attention. The flowers were arranged in a series of beds of divers forms, each bed being devoted to one variety. The bright blue Enchantress was used in filling the four corner beds. In the large beds on the lawn, one at either end, was the bright pink Lady Derby, the several hundred spikes being uniform in development and the flowers bright in colour, two of the four crescents at the sides were devoted to the richly-coloured Yellow Hammer, and two to the pure white L'Innocence, a variety that has become popular for bedding purposes. Between each pair of crescents there was a lozenge-shaped bed, and these were occupied by Sir William Mansfield, a mauve-coloured variety that has much value for the contrast it affords. As on the occasion of the great quinquennial exhibition held in 1905, Messrs. Ant. Roozen and Son, of Overveen, near Haarlem, exhibited a magnificent collection of specimens arranged in pans, ten plants in each. These were grouped in four beds, one at each corner of a lawn formed in the centre of the second of the exhibition houses, and produced a display not less remarkable for the high quality of the specimens than for its effectiveness. The space between the pans was filled with ferns of lowly growth, and these served the double purpose of hiding the pans and affording a pleasing contrast to the glowing colours of the hyacinth flowers. Prominent among the varieties were such well-known favourites as King of the Blues, La Grandesse, Yellow Hammer, Alexander Von Orange, Lord Derby, Queen of the Pinks, Enchantress, Vuurbaak, Lady Derby, General Pelliser, Baron Von Tuyll, and Solfaterre.

On the breadth of turf on which Messrs. Ant. Roozen and Son's hyacinths produced such a rich effect were rose-tinted astilbes, a group of Lilium longiflorum, belts of lily of the valley, and fine groups of Primula obconica. This primula was also well shown in several other parts of the exhibition, and while some were weak in colour, the majority were remarkable for the rich shades of rose and pink they afforded, and bold trusses in which the flowers were arranged. The contributions to the classes for collections of hyacinths were arranged on one of the side stages in the third exhibition house, which was chiefly devoted to cut lilac bloom, and formed a five-tier bank about one hundred feet in length. In the great class for one hundred plants, Mr. J. H. Gehrels, of Overveen, was successful in winning the gold medal offered as the premier award. The spikes were in all cases splendidly developed, and the leaves neat and so stout as to stand erect with the points reaching to the base of the flower spikes. Some of the finest of the varieties in the collection were King of the Reds, Queen of the Pinks, Enchantress, pale blue with light centre, a variety of much merit. Conquest, one of the brightest of the yellow varieties, Vuurbaak, Jacques, a pale pink variety with exceptionally fine spikes; Beauty, bright yet soft rose; Lord Salisbury, Cardinal Wiseman, an attractive pink variety; Corregio, and Mons. Vander Hoop, two pure white varieties, with well-developed spikes. Messrs. Eldering and Son, Overveen, occupied the second place with a well-grown collection in which Orange Queen, a brilliantly-coloured variety, was conspicuous. Very fine also was La Victoire, a deep rose-pink variety. In the principal collections in other classes there was abundant evidence of skill, but as they consisted for the most part of well-known varieties there is no occasion to speak of them in detail.

One end of the third exhibition house was filled with a collection of early tulips. These were shown in pans ten bulbs in each, and as they were finely grown, and consisted of distinct varieties, the collection possessed considerable value as an object-lesson. The single varieties included the Yellow Pottebakker, President Taft, blush feathered with crimson; Haes, crimson; Crounne d'Or. Herr Bergheim, crimson; White Joost Van Vondel, Mons. Tresor, one of the finest of the yellow single tulips; Ophir d'Or, also a fine golden-yellow variety; Coleur de Cardinal, a well-known deep crimson tulip; Hurille, a beautiful blush-coloured variety; and Rembrandt, a handsome rich crimson variety. The double varieties of special merit included Premier Gladstone, a medium-sized, finely-formed flower of a rich crimson hue. Lac Van Haarlem, rich rose, and El Toreador, crimson, with broad border of deep orange.

In the second exhibition house double and single tulips were used with remarkable judgment, and their bright colours were singularly effective. The broad borders in which lilacs and a host of subjects of some considerable height were arranged, had in front a belt of turf about four feet in width. Along these belts were beds of tulips about two feet square, and placed at a sufficient distance apart to allow a space of eighteen inches between them. Each bed contained one variety, and as they were nearly all distinct, the finest of the early-flowering varieties were represented. The most noteworthy were the varieties mentioned as having been included in the collection shown by Messrs. Van Waveren. The principal exhibitor of the small beds was Mr. G. Eggnik.

Tulips were used in a somewhat similar manner in the first exhibition house, but here the space was larger and the beds were increased to about five long by three feet wide, and a few beds of polyanthus narcissi were interspersed with the tulips.

Freesias were represented by an interesting collection contributed by Mr. C. G. Van Tubergen, of Haarlem. These consisted of new varieties, mostly raised by himself, and included Contrast, white, with orange spot; Le Phare, brilliant pink; Chapmani, an English-raised hybrid, with rich golden-yellow flowers; L'Apogèe, pale yellow; Amethyst, light blue; L'Aveim, rich rose; Rose Bonheur, white tube, with rose-coloured lower and golden blotch on the lower one; and Tubergeni, lilac, tinted rose, a very free-blooming variety, with medium-sized flowers. A collection of hippeastrums from Messrs. A. Warmenhoven and Son, Hillegom, produced a brilliant display of colour in the exhibition house, in which the lilac flowers were displayed. Several of the varieties were of excellent quality, but it would appear, from the varieties forming the collection, that less importance is attached to the form of the flowers than in England.

PLANTS.

Begonia Gloire de Lorraine and its varieties were used to good effect in the first of the exhibition houses. The specimens, all of which were more or less well flowered, were suspended between the pillars supporting the structure, and the clouds of flowers presented a charming appearance against the grey and pale fawn canvas that was elegantly suspended from the roof. In another of the exhibition houses there was an exhibit of two dozen plants, grown in six-inch pots, from Mr. D. Bardse, of Aalsmeer, that were of great excellence, even in these days, when the cultivation of Gloire de Lorraine begonia has been brought to a high degree of perfection. The plants were so freely flowered that the masses of bloom were about two feet in diameter, and so dense as to hide both pots and foliage. The large size and high quality of the blossoms were not less remarkable than their numbers. There was a second collection from another exhibitor, and these were of interest as showing how greatly the value of this begonia depends upon cultural skill. The plants in this collection carried a profusion of flowers, but they lacked breadth of petal and were pale in colour, as in the case of so many plants presented to public notice.

FLOWERING SHRUBS.

Lilacs made a great feature of the exhibition, for a large number of classes were provided in the schedule for cut flowers and for plants of various sizes, including standards and half-standards, and for bush specimens, some of the classes for the latter being for pot-grown plants, and others for those lifted from the open borders and forced. The superiority of the pot-grown specimens for decorative purposes was fully demonstrated, for in all cases the foliage was stout and fresh, and remained in the best possible condition throughout the exhibition, while the foliage of the lifted plants showed signs of distress on the opening day. When the lilacs are forced simply for the production of supplies of flowers the latter appear to be equally as useful as those which had been grown in pots.

Cut flowers of lilac were shown in immense quantities, and in magnificent condition. The collections in competition for prizes filled in one of the exhibition houses a table ten feet wide and nearly two hundred feet in length. Especially noteworthy were the six vases from Messrs. D. and J. Keessen Bros., Aalsmeer, for in them were arranged huge sheaves of flowers ranging from three to four feet high, and from thirty inches to three feet in diameter, and remarkable for the graceful disposition of the flower spikes. The principal varieties were the bright lilac-blue Charles X., the pale blue President Grevy, remarkable for the length of the flower spikes; the pure white Marie Legraye, the most popular in Holland of the white varieties; and the rich red-purple Souvenir Leon de Spâth. In the majority of the other collections the flowers were arranged in glasses of the usual trumpet shape, about twelve spikes in each. Less effective than the fine arrangements first mentioned, these vases were highly attractive, and afforded an admirable object-lesson in the use of lilac flowers in the embellishment of apartments on ordinary occasions. Messrs. D. J. Tas and Son, of Aalsmeer, who were very successful exhibitors of cut lilac, contributed a very fine set of vases of cut sprays of hardy shrubs, other than lilac, which formed a pleasing and interesting feature. Among other of the more attractive subjects were the white and lilac forms of Wistaria sinensis, double-flowered peaches, Deutzia Lemoinei, Pyrus malus Scheideckeri, Prunus triloba, Viburnum opulus sterile, and Staphylea colchica.

The two huge banks of lilacs in the second exhibition house were of much interest for the wealth of flowers they afforded; but as the large specimens were necessarily bare of foliage for some part of their height, one could have wished the dwarf plants that were clothed with leaves to the rim of the pots had been arranged along the front. This would have considerably complicated the work of judging, which was quite difficult enough owing to the little difference in the merit of some of the leading collections; the next best thing was done by planting a line each of variegated aspidistras and funkias to hide the stems, and these produced a pleasing effect. The contributions to the class for twelve plants of Marie Legraye were models of what such plants should be for the decoration of the conservatory. They were about thirty inches in height, and had seven or eight finely-branched spikes each. These were shown by Messrs. Felix and Dykhuis of Boskoop, who exhibited also a group of plants of Charles X, of a similar character.

There were several large groups of rhododendrons, all more or less well flowered, and some contained two hundred or more well-bloomed plants each. The most interesting of these contributions was that exhibited by Messrs. C. B. Van Nes and Sons, of Boskoop. This consisted of large, finely-flowered bushes of White Pearl, so well known and highly appreciated at home, and the beautiful new variety Prinses Juliana, a distinct variety of much merit. This is somewhat similar in character to the magnificent and highly popular Pink Pearl, but it differs from it in having flowers finely fringed at the margin, and of a deep brilliant pink hue during the earlier stages of development. This is said to have originated as the result of a cross between Rhododendron Aucklandi and a hybrid. This was awarded the gold medal offered for the best new plant in the exhibition.

Deutzias, pyrus, viburnums, and Mollis azaleas were largely shown, but the last-named were rather disappointing after the fine displays we have seen at the Temple Shows. The plants were mostly of small size, and not specially well flowered. The best examples were those shown by Messrs. Koster, of Boskoop, and associated with other subjects they produced a rich colour effect.

Especially attractive was the collection of forced shrubs with which the firm of Wezelenburg, of Lieden, filled a large bay near the entrance to the first exhibition house. Here were Wistaria sinensis, Mollis and Ghent azaleas, Prunus triloba, laburnum, Cytisus præcox, the double common broom, Forsythia suspensa, lilac in variety, and double peaches. In this collection also the Mollis azaleas were highly meritorious.

Having a thorough acquaintance with the splendid service of train and turbine steamers provided by the Great Eastern Railway Company for the purposes of their passenger traffic between England and the Continent via Harwich and the Hook of Holland, we suggested in our issue of March 19 that those of our readers who intended visiting Haarlem would be wise in taking advantage of the Hook of Holland route. We were pleased to find that not a few of the English visitors had acted upon our suggestion, and were highly satisfied with the result. Some of our business friends who have a difficulty in being away at this season of the year for more than a day or two, put to a practical test the possibility of visiting the show without being away from business more than one day, and they also were well satisfied. It would be difficult to imagine how it could well have been otherwise. The visitor to Haarlem leaves Liverpool Street at 8.30 p.m., and the train that connects with the steamer at the Hook of Holland reaches Haarlem at 7 a.m. He can dine between London and Harwich, and have six or seven hours' sleep between the latter place and the Hook of Holland. Returning, the visitor leaves Haarlem at 9.30 p.m., and reaches Liverpool Street at 8 a.m., having, if he so wishes, breakfast on the train. We mention this because it is anticipated that at the exhibition arranged for the middle of this month, when the deputation from the Royal Horticultural Society will be present, there will be a much larger contingent of English visitors than was the case on this occasion.

Birmingham Gardeners' Association.

The fortnightly meeting was held on March 21, and attended by an average number of members. Mr. J. Markham, gardener to H. Cartland, Esq., The Priory, King's Heath, discoursed upon "Peaches and Nectarines," and it was his initiatory address, as he is a comparatively new member. He dealt with the subject in a thoroughly practical manner, peach culture being a speciality with him. His text was the culture of peaches and nectarines under glass, and from the construction of the border to the full establishment of the tree his remarks were duly appreciated.

The chairman (Mr. T. Humphreys) when inviting a discussion among the members, gave a brief review of the lecturer's subject, and endorsed its chief points, while Messrs. T. Brown, W. Spinks, A. Cryer, W. Gardiner, and others afforded instructive details from their own practical experience, and the essay was more or less favourably criticised by them.

A hearty vote of thanks was accorded Mr. Markham for his lecture.

Beckenham Horticultural Society.

On Friday, March 18, Mr. Alex. Dean, V.M.H., gave a lecture on "Vegetables as Garden and Exhibition Products, and as Food." Mr. Sherley Price, vice-president, was in the chair. There was a very full attendance, which the lecturer thoroughly interested for upwards of an hour. For a text, an imaginary "Collection of Vegetables" was taken, such as is usually seen on the exhibition table; the lecturer touched on their arrangement, and pointed out the great strides that have been made within the past few years in the improvement of the several kinds, i.e., peas, runner beans, onions, tomatoes, etc., etc. The lecturer also dealt with the culture of vegetables from a patriotic point of view, showing how our millions of acres of idle land might be made to feed the people with wholesome vegetables, and make us, to some extent, more independent of foreign supplies, more especially so if for any reason outside supplies were cut off or diminished. The lecturer, in his capacity of judge for the Surrey County Council, had frequently seen vegetables of the value of £10 growing on a twenty-rod plot, showing what mother earth can do if properly treated.

Mr. Dean also made some allusions to the new National Vegetable Society, and its work, trials, etc. In reply to a question he urged the necessity of securing seeds of the best stocks, pointing out the extreme care and expense the leading seed-men incur to ensure pure stocks. At the close a most hearty vote of thanks was accorded Mr. Dean.

From Fairlight (Mr. Trowel) came Dendrobium nobile, and from Kelsey Park (Mr. Webster) came rhubarb, apples, pears, and various cattleyas; and from Homewood Gardens came cyclamen, mignonette, polyanthuses, etc., etc.; in each case the highest award was made.

South Shields Chrysanthemum Society.—We are sorry to learn from the report presented to the annual meeting, held the other evening, that the financial results of the work accomplished by this society during the past year was not satisfactory. Commencing the year with a credit balance of £18 7s. 7d., the society had a debit balance of £13 14s. 6d. at the close. In other words, the loss on the year was £32 2s. 1d. Mr. W. Swinney, chairman; Mr. J. T. Reed, treasurer; and Mr. J. E. Stout were re-elected. The exhibition for the current year will be held on November 9 and 10.

FORESTRY NOTES.

During November last Mr. W. Dallimore made a tour through some of the wooded country in the North of England, and the places visited were Raby Castle, Haydon Bridge, Alnwick Castle, Chatsworth, and Wortley Hall. A report on the tour is published in the current issue of the "Kew Bulletin," and to those who are interested in forestry will be found of much interest. Before proceeding to give a description of the woodlands in the estates visited he makes allusion to certain general considerations and reflections induced by similar visits to localities in various parts of the country where trees are cultivated under forest conditions. This introduction has such wide interest that we reproduce it for the benefit of our readers.

General Condition of Plantations.

Broadly speaking, woods up to twenty years of age are found to be in good condition, but many older ones are suffering from over-thinning and over-aged trees. Owners, estate agents, and foresters are enthusiastic over forestry matters, but much uphill work is necessary to counterbalance the effects of neglect and injudicious manipulation of bygone years.

Deteriorating Trees.

In many parts of the country well suited for the purpose, sentiment is allowed to interfere too much with practical forestry to admit of its being conducted on sound business principles. For instance, plantations are frequently found to be composed of trees which have arrived at, or passed, their prime, and which will never be of more value than they possess at the present moment; yet for more or less sentimental reasons these trees are allowed to remain year after year. From a practical point of view such plantations ought to be cut over by degrees, so that after a resting period of two or three years, the land could be replanted and the next generation of trees grown. If these old trees are allowed to remain, say, for another twenty years, the timber will be worth no more at the end of that period than at the present time, and may be worth less on account of natural decay; whereas, if the value of the timber were realised and the cleared areas replanted, by the end of twenty years new plantations would be nearing the end of their unproductive stage. The eventual cost of clearing some old woods may be heavy, for there must be many trees that can be of little use except for firewood.

Undoubtedly there are many instances where plantations of old trees are essential for landscape effect, and where there are fine old park-grown specimens, whose value cannot be calculated in pounds, shillings, and pence, which it would be rank vandalism to remove. These, however, are not now in question; it is to trees which are grown exclusively for timber that the present remarks are directed.

Over-thinned Woods.

Modern foresters are suffering rather severely for the sins of their forefathers, insomuch that a great number of woods, forty to eighty years of age, have been over-thinned. Far too much head room has been allowed, with the result that the trees have developed branches at the expense of the trunks; therefore, the crop of timber over a given area is often less than half what it ought to have been. In some places an attempt is being made to rectify this by underplanting, but a long period has to elapse before the planter can see the beneficial results of his labour.

Young Woods.

By the appearance of the young woods one can appreciate the work that is being done, for in the majority of instances these are in a highly creditable condition. Young plantations generally, whether in poor or in better-class ground, are making satisfactory progress, and considerable care is being exercised as regards thinning and general upkeep. In some instances diseases of various kinds are apparent, but these are receiving what practical attention is possible.

The kinds of trees planted on a large scale are surprisingly few, the chief being larch, common and Japanese, Scots pine, Corsican and Austrian pine, spruce, oak, beech, birch and sycamore, with a little ash and poplar. Very little Douglas fir has been noted, and no large plantation has been seen.

In most cases mixed plantations are preferred to pure woods, though the latter may occasionally be noticed. The value of a little shelter is apparent in the case of young trees everywhere. A natural depression in the ground, a clump of old trees, or even a low hedge results in the trees in the vicinity being more vigorous than those which are less favoured.

Whilst inspecting various plantations the thought has occurred that a great deal of valuable experimental work might be carried on at a small expense, with the co-operation of landowners, by distributing young trees of various kinds, not at present grown for timber in Britain, which are known to produce valuable timber and would be likely to thrive. These, planted in mixed woods, in different parts of an estate, could be easily compared with trees which produce less valuable timber but are known to grow well, and in a few years' time, a decision could be arrived at as to the prospects of different trees in different neighbourhoods. This sort of thing is being done with Douglas fir on one or two estates.

Estate Nurseries.

Estate nurseries are receiving attention almost everywhere, and foresters are enthusiastic over their nursery grounds. The general conclusion is that a nursery in connection with estate forestry is a valuable asset, for, in addition to its being more economical to grow young trees rather than purchase them large enough to put out, more satisfactory results are obtained from trees grown on the place than from those received from a distance. The conclusion is possibly just, for not only are the trees grown under the same climatic conditions from babyhood, but when planting, it is only necessary to lift sufficient at one time for a single day's planting, no long railway journey is necessary, and the laying in of many thousands of young trees is dispensed with. In some cases the young trees are raised from seed sown on the estate, but more frequently one-year-old seedlings are purchased. These are planted in nursery rows and taken to permanent positions when from three to four years of age.

Sale of Timber.

It is difficult to form anything like a correct idea of the average value of the different kinds of timber, since so much depends on quality and distance from railway or town. Occasionally a local demand occurs for some special kind of wood, and a good price is obtained, while, only fifty miles away, little more than firewood price has been obtained for the same kind of timber. Undoubtedly, were the supply of timber regular prices would be better; as it is, fellings are often irregular, and one year the local market may be flooded, while for several years afterwards no timber is cut. Owing to this, there is no encouragement for timber merchants to erect plant for dealing with large quantities of timber in a particular neighbourhood, and it has to be sent a long distance to a market, a circumstance which has a decidedly adverse influence on the price. Larch usually sells well, and from tenpence to one shilling and twopence a cubic foot is obtained standing. Scots pine, on the other hand, may fetch eightpence a cubic foot if of good quality, whilst in an out-of-the-way place it has been sold for twopence halfpenny. On one estate a small plantation of black poplar about sixty years old was disposed of recently at ninepence a cubic foot after deducting cost of delivery at the local station two and a-half miles distant. Oak appears to fluctuate considerably, some being down as low as one shilling while from other plantations it is sold at double the price. As a rule timber is sold standing, and the buyer sees to the cutting and removal.

Timber for estate purposes frequently forms a large item, and each estate usually runs its own saw mill and creosoting plant.

Sport and Forestry.

The rearing of game, shooting, and to some extent hunting, deserve serious consideration in connection with forestry. On most estates gamekeeping and forestry are run together, therefore the forester has to arrange his work so that there is no serious disturbance of game. This may handicap him rather considerably, for he may be precluded from work in certain woods during several of the most useful months of the year, e.g., from September until shooting parties are over, which may not be until about the end of January. Moreover, gamekeepers must have the run of the woods, and, in the event of undergrowth being scarce, branches of Scots pine and other evergreens may have to be introduced from other places and stuck in the ground. As the result of this branches brought from disease-infected trees have sometimes started an epidemic in what was previously a clean plantation. In some cases it has been noticed that some of the poorer trees had been partly chopped through and broken over so as to lie on the ground. Such a proceeding may be advantageous from the gamekeeper's point of view; it certainly is not so from that of the forester. The rearing of pheasants, however, causes but slight annoyance as compared with the damage done by hares and rabbits.

Hares and rabbits are responsible for considerable damage by the wholesale nibbling of the bark of young trees. Some plantations have been observed where almost every beech and oak had been nibbled, and it appears that it has been necessary to plant some woods three times over on this account. Many of the younger plantations are protected by wire netting. This, however, is an expensive item, and adds considerably to the upkeep of woodlands. The system of debiting the game department with the cost of wire netting has been introduced on some estates; this appears to be a proper step to take, since but for the game, wire netting would not be required. Acting on strictly business principles, the game department ought to be debited with the loss caused by nibbled trees, extra labour, and introduced insect pests.

Damage caused by hunting is usually due to thoughtlessness. In the excitement of a hot chase young plantations sometimes suffer, whilst cases are known where a huntsman and his pack of hounds have quartered themselves as calmly in a two-year-old plantation as they would have done on a meadow.

Labour.

As a rule the work on an estate is carried on by regular hands. Ordinary woodmen are drawn from the neighbourhood; head foresters and foremen from other parts of the country. A few young foresters move about from estate to estate to gain experience, and these are the men who usually obtain situations in after-life as head foresters. If extra labour be required for planting, men are preferred who have led an agricultural life, that is to say, men who have small farms in the vicinity, and their sons, or agricultural labourers. The older foresters have very decided views with regard to the training of young foresters. They maintain that a sound practical training is essential but not sufficient, and that a certain amount of theoretical knowledge, with some idea of general estate management, is desirable. On this account some foresters give those under them practical instruction, lessons on book-keeping and other subjects, while those in the vicinity of Newcastle endeavour to get their men to take the forestry course of lectures given at the Armstrong College in that city.

GRAPES AND HOW TO GROW THEM.—A [illegible] trated guide to propagation, culture, and [illegible] ment in vineries, greenhouses, and in the [illegible] By J. Landell, F.R.H.S. Price 1s. net, by post [illegible] cloth, 1s. 6d., by post 1s. 8d., from W. H. [illegible] Collingridge, 148 and 149, Aldersgate Street, [illegible]

FRUIT TREES AND FROST.

Those who grow fruit trees on a large scale, or those whose trees are standards, or large bushes and pyramids, must necessarily be at the mercy of a sharp frost at flowering time, or even after the fruit has set, but those who have wall trees, or restricted trees of any sort in the open, may, when they see them well set with fruit buds, look forward with a fair amount of confidence to a crop of fruit the following season if they are prepared to use some little foresight, and be prepared for that one disastrous night (and usually one only), without which either April or May seldom leaves us. The frosts of the later spring are usually on perfectly still nights, when the colder, and, therefore, heavier, air drains into the valleys and low-lying parts, a fact with which the cyclist is so familiar, who, when rushing down a hill, suddenly leaves the warm, dry air, and plunges into that which is cold and damp. Hence the increased liability of fruit trees in such low-lying situations to have their blossoms destroyed by frost, the blossom on dwarf trees often being destroyed by frost even when that on tall trees escapes. When, however, we have a frost accompanied by cutting east wind the conditions of winter obtaining in April, as was the case in 1903 and 1905—then high and low suffer pretty much alike, and it is little that we can do to any trees which are not on a wall. But such conditions at the flowering time of the later-blooming varieties of fruits are quite exceptional, and even in the Arctic weather of the latter part of April, 1908, there was scarcely any wind. I propose to give some little of my own experience in securing good crops of fruit in a low-lying part of the eastern counties, notwithstanding the trying springs of nine out of the last ten years, that one exception being 1904.

The careful observation of a minimum-recording thermometer a necessity in every garden where plants have to be protected from frost at different hours of the night and early morning, will not only show this, but will enable us to tell with a fair amount of certainty when these exceptionally frosty nights may be expected. Leaving out of consideration for a moment apricots, peaches, and nectarines, all of which flower very early, usually being out by the end of March, it is not usually more than two or three times in a season that the prospect of frost sharp enough to damage most fruit blossom after the middle of April (and plums and pears, with a few exceptions, are not generally in full bloom before this) is sufficiently likely to warrant one in protecting one's fruit trees, and if one takes a real interest in them all through the year, and not only just when the fruit is coming on, it is worth the trouble of protecting them on these two or three nights. If one finds on looking at the thermometer in the morning that one has covered up the trees unnecessarily and this is bound to happen sometimes there is always the satisfaction of knowing that the larger trees, the blossom on which has opened since the last frost, and could not be covered up, are also safe so far. The earlier-flowering stone-fruit trees certainly do need more care, for I have seen apricots in full bloom at the beginning of March, and peaches and nectarines ten days later, and in such cases there is certainly the possibility of having to protect the trees a good many nights if a crop is to be secured. But then, what magnificent fruit, when we get it! I have eaten peaches which cost a shilling each not nearly so good as those off my own garden wall at the same time of the year.

Seeing, then, that the protection of our choice fruit trees from frost can be accomplished without making an undue toil of it, let us consider some ways of doing it which are simple, and yet fairly effective in any ordinary emergency. Some put fish netting over the trees, and leave it there from flowering time till the danger of frost is over. This has the merit of simplicity, but it has also its drawbacks, as, if single, it will not secure the trees against a sharp frost, and, if double, may go a long way towards keeping the bees away from the blossoms. Moreover, if the trees are on a wall, and the netting is hung directly on the trees, it is difficult to remove it, say, in the middle of May, without also removing some valuable shoots and incipient spurs. Another method open to objection is the setting of bean sticks in front of wall trees, so as to form a sort of hedge, and leaving them there for weeks. I used to adopt this, but gave it up many years ago, because I found I had a very poor crop of fruit, doubtless largely because the bees were deterred from visiting the blossom. At any rate, I had a much better crop directly I dropped the practice. If the sticks or branches of any sort—if evergreen all the better—are set in front at night, when they are likely to be needed, and removed next morning, it is a fairly effective way of keeping off the frost, and is not more trouble than some other ways. For high walls I often use whole bundles of tall bean sticks just as they come from the woodman, or make each bundle into two if very large; such bundles set a yard or two apart keeping off all frost from the parts of the trees immediately behind the bundles, and a good deal from the parts left exposed between.

I leave out of consideration altogether the elaborate methods sometimes described, amounting almost to the erection of a glass house in front of the trees, as these notes are not for those who have to do with large gardens, and abundant labour, where such practices are in vogue. The method I adopt for the most part consists in the simple device of setting in front of the trees plain sticks of the same height as the wall after they are stuck in the ground, and then hanging light coverings of any sort over them, a brick or two laid on the top of the wall at intervals keeping them from falling down. This, in moderately still weather, is absolutely safe, and the blossom and young shoots are not damaged by contact with the coverings. If one adopts this plan, and collects suitable material for the purpose, it is surprising what an accumulation one has after a few years, assuming the coverings are taken care of, and not put away damp after a very dewy night, or even a shower of rain or snow, as will happen sometimes.

As regards trees in the open, size is a very important factor in determining which we shall protect, though, naturally, when a sharp night comes we do not like the prospect of any crop being destroyed for the sake of a little trouble, on, it may be, only one evening. I do not know of any better way of protecting such trees than throwing over them coverings of some very light material, the corners being pinned, if need be, to keep them from blowing off. The extension branches will protect the blossom from damage by the coverings—for, in addition to injury to the tender parts of the flower by pressure, it must be borne in mind that any blossom in contact with the covering will freeze through it almost as easily as if there were no covering over it. The new terminal shoots, however, will be easily rubbed off if the coverings are not very carefully removed in the morning.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

WARTED VINE LEAVES.—H. P. E., Warwick: The trouble is due to excess of moisture in the atmosphere and the consequent improper transpiration from the leaf. A better adjustment of ventilation in conjunction with the outside conditions will improve matters provided neither moisture nor artificial heat are used to excess. A heavy stagnant atmosphere will produce all sorts of ills in plants, therefore advantage should be taken of every favourable opportunity to change the air in the house without going to such extremes of ventilation as would cause a serious fall in temperature and severely check growth.

PRIMULA OBCONICA.—N. T. R., Croydon: This fine species may be sown almost at any time, but the present season is a very favourable one because, with careful treatment, the seedlings will make handsome specimens by the autumn and flower well right through the winter. Well drain a shallow pan and fill it to within half an inch of the rim with fine, sandy soil; press the surface firmly and evenly, and water through a very fine rose. Sow the seeds thinly and evenly over this moist surface, cover with a sheet of glass, place the pan in a warm greenhouse, and give shade until the seeds germinate. Prick off the seedlings into other pans as soon as they can be conveniently handled, and when they are large enough pot them singly in three-inch pots. A cold frame or airy greenhouse will suit them all the summer. Six-inch pots will be quite large enough for them to flower in, and a good compost for the final potting is two parts of good loam and one part of decayed and dried manure. If the loam is rather heavy add some leaf-soil. A fair amount of sand should be added.

NEW PLANTS OF 1909.—J. M., Abergavenny: The new plants, flowers, fruits, and vegetables of 1909 are described in the "Gardening Year Book for 1910" (post free 1s. 2d. from the Gardeners' Magazine Office, 148 and 149, Aldersgate Street, E.C.), and many of the principal plants are illustrated. You will find the book most interesting and useful in other directions also.

PELARGONIUM CLORINDA.—D. C. F., Leicester: We have frequently drawn attention to the great usefulness of Pelargonium Clorinda. It is the result of a cross between a scented leaved pelargonium and a show pelargonium, and, writing from memory, we believe it was raised by Dr. Bonavia, and put into commerce by Messrs. H. Cannell and Sons. Latterly it has become a popular market plant. It is fine for a greenhouse and may be grown up a rafter, as a standard or bush, or trained to a fan-shaped or other kind of screen. Every bit of new growth quickly flowers, so that it is practically a perpetual flowering variety. It can be readily propagated in the usual way. Owing to its habit of flowering so freely it is necessary to feed the plants with liquid manure when well established, otherwise the trusses and flowers will be small.

SOLANUMS.—R. E. G., Skipton: Remove all the old berries and cut back the growths to one-half or one-third of their length and then put the plants in a warm pit or greenhouse. Syringe freely on all favourable occasions and new growths will soon commence to form. At this stage shake the old soil from the roots and reduce the root system considerably, afterwards potting the plants in small pots, in loam, leaf-soil and sand. Keep the plants in a warm, light place and syringe them twice daily for awhile. Presently cooler conditions will suffice and larger pots be needed. Reject all plants that have carried few or small, dull coloured berries, and put in a few cuttings of the best varieties. It is always desirable to have young stock so that as plants grow old, or too large, their places may be filled with young, vigorous specimens.

PLANTING SWEET PEAS.—A. F. C., Andover: If the plants are sturdy and have been fully exposed for two or three weeks they may be at once planted where they are to flower. It is a great mistake to leave the plants in the pots after this date if they are hardy and the ground is ready for them. Well hardened sweet peas will stand several degrees of frost without suffering in the least. Water the plants a few hours before planting and if the ground is dry give water after planting, but use water that has been exposed to the air for several hours. A few small twigs will be needed to keep the plants erect, but staking need not be done at once. If birds are troublesome a few lines of black thread drawn tightly along the rows will scare them.

OYSTER SCALE.—M. M., Tiverton: The life history of the Oyster Scale, as recorded by the Board of Agriculture, is as follows:—The winged males appear towards the end of April or in May, according to the weather conditions. By this time the females are adult and fertilisation takes place. Eggs are laid containing larvæ ready to hatch. The tiny larvæ wander over the bark, ultimately settling down to feed by inserting their sucking mouth parts into the bark. In this larval stage there is practically no sexual distinction. A secretion is given off which covers the larva, and later the first moult takes place and the second stage is attained. The moulted skin is not thrown aside, but remains to form part of the shield or covering of the insect, this covering being greatly added to and completed by secreted matter. This second stage is a quiescent one, but the insect, anchored by its mouth parts, continues to suck up the sap. It is important, from the standpoint of treatment, to note that it is in this second immature stage, complete by the autumn, that hibernation takes place. About the beginning of the next April, the second stage males pass into the pupal condition, and, after a pupal stage of three weeks, the pupal skin is cast and, in suitable sunshiny weather, the adult males emerge. This last cast skin is to be found for a time at the hind end of the scale. Meanwhile the second stage females—not really differing much from the future adult females—accomplish their last moult and become adult. Pairing then takes place and eggs are subsequently laid, so continuing the species.

NAMES OF PLANTS.

F. L. C., Godalming.—1, Forsythia suspensa; 2, Chionodoxa Luciliæ.

O. T., Chester.—1, Ribes sanguinea; 2, Saxifraga apiculata; 3, Adonis vernalis.

P. G. B., Tenterden.—1, Odontoglossum Humeanum; 2, O. Wilckeanum; 3, Cattleya Loddegesi.

E. E., Lewes.—1, Nephrodium lepidum; 2, Nepenthes Burkei; 3, Cydonia japonica; 4, a Hemerocallis, send when in flower.

M. E. J., Leeds.—1, Coleus thyrsoideus; 2, Pinguicula caudata; 3, Cœlogyne cristata; 4, Saintpaulia ionantha; 5, Phrynium variegatum.

NAMES OF FRUIT.

F. E., Taunton; and A. W., Colchester.—It is of little use sending small and more or less shrivelled fruits for identification at this season of the year, as it is impossible to deal with them satisfactorily. Send full-sized examples in the autumn or early in winter.

PROPOSED MEMORIAL TO THE LATE MR. DAVID THOMSON, V.M.H.

A very general feeling has been expressed amongst the many friends of the late Mr. David Thomson that a memorial should be established to perpetuate the name of one of the greatest of British gardeners.

It is suggested that the memorial take the form of a fund from which to grant pensions to aged and infirm gardeners or their widows, such pensioners to be always known as "The David Thomson Memorial Pensioners," the fund to be administered by the committee of the Gardeners' Royal Benevolent Institution, of which Mr. Thomson was for so many years a very warm friend, and to which he subscribed so liberally.

When it is remembered how much Mr. Thomson did, during a long and strenuous life, for the advancement of every branch of gardening, what a noble example he always set by his uprightness of character, his great courtesy, his unostentatious character, and his readiness always to impart to others any information which could benefit them in any way, it is felt that such a proposal as that now suggested is not only due to his memory, but will be most cordially welcomed by every lover of gardening.

Mr. Thomson's great abilities were recognised during his lifetime by many honours, amongst which were his having been one of the original recipients from the Royal Horticultural Society of the Victoria Medal of Honour, and also by his having been awarded the Neill Prize by the Royal Caledonian Horticultural Society.

His many friends are very desirous that the memory of so good a man—one of the very foremost gardeners of his generation—should now be perpetuated as being not only his due, but also as an incitement for future generations of gardeners to follow so noble an example.

The undersigned will thankfully receive contributions from any who desire to further so good an object: Harry J. Veitch, V.M.H., treasurer of the Gardeners' Royal Benevolent Institution, Royal Exotic Nursery, Chelsea, S.W.; James Whytock, president of the Scottish Horticultural Association, The Gardens, Dalkeith Palace, N.B.; J. W. McHattie, vice-president of the Royal Caledonian Horticultural Society, Public Parks Office (City Chambers), Edinburgh; George Monro, V.M.H., Covent Garden Market, London, W.C.; J. H. Goodacre, V.M.H., The Gardens, Elvaston Castle, Derby; W. Henderson, The Gardens, Balbirnie, Markinch, N.B.

Strawberry Runner Experiments have been conducted by the National Fruit and Cider Institute during the past few years for the purpose of testing the relative cropping qualities of the "first" and "second" runners of strawberry plants. By the term "first" runner is meant the first runner produced from parent plant on a given stem, while the "second" runner is the next produced on the same stem. The trials were commenced in 1906, and the crops for 1907 were small, the plants for the first season not being particularly strong, although, as might be expected, the "firsts" were the larger. In 1908 the yield was fair, considering the nature of the season; and the plants of the two groups were more even in size and strength. In the two years the total yield for five varieties from the "first" runners was 713lb., and from the "second" runners 607lb. The assertion by some growers that the "second" runners produce larger crops has thus not been supported by the results for the first two seasons, although, it is suggested, possibly the third season's crop may result differently, since the "seconds" were originally the more backward plants and may, therefore, take longer to reach full vigour.

Rhubarb Pudding To-day!

BIRD'S
CUSTARD

Delicious served Hot as a Sauce,
with Rhubarb Pudding or Pies and Stewed Rhubarb.

Bird's Custard softens any slight acidity of the Rhubarb, whilst leaving unimpaired its fresh flavor and invigorating qualities.

Directions:—Prepare the Custard in the usual way, and serve immediately while **Hot.**

PHLOX STELLARIA.

It is matter of regret that the pretty Phlox stellaria should have to play second fiddle to P. subulata and its varieties. Never was a plant better named than this delightful starry-flowered phlox, which is capable of such charming effects out in the rock garden. To see it in its beauty during late May and June, with its daringly free growths gemmed over with the multitudes of white blossoms (in which a tinge of blue is noted) is one of the sights of the year in the rock garden. These streaming cataracts of dainty beauty, so clearly defined against the dark rocks, should for ever popularise this plant.

It is very distinct from the P. subulata section, its light habit, thinner, and much longer foliage, and its free, roving habit, being sufficient to distinguish it from the general run of alpine phloxes. It is easily propagated from cuttings. In sandy soil, under a close frame or handlight, one can readily root whatever quantity may be required.

Varieties of stellaria are as pretty as the type, and one recalls the pretty annulata, with its blue-grey flowers with a purplish ring; and atro-lilacina, a sterling gem of a deep mauve-blue colour.

If one may express a thought, surely some of the beautiful varieties, which are usually grouped as "subulata varieties," would be more in their place as near relations of P. stellaria? What about G. F. Wilson, for instance? Its light, free growth and pale blue blossoms betoken relationship with P. stellaria rather than that with the closer, heavy tufts of P. subulata. Others might be quoted, as Newry Seedling and Eventide, as belonging in reality to the P. stellaria group, though, perhaps, after all, the great thing is, that we have these delightful phloxes available for the decoration of the rock garden.

Plenty of root room should be allowed for the development of the plants, this being a very necessary detail in determining the formation of bold masses. In making up a bed or series of beds in the rock garden plenty of rough fibrous loam, with a little sharp sand and decayed manure, will provide a satisfactory food basis for them. Lime rubble is often introduced in small quantities, and this seems no deterrent to the well-being of the plants, either in regard to growth or blossoming, while it has the advantage of assisting to sweeten the soil, and to keep it open for a prolonged period.

P. S. Hayward.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Shirley and Millbrook Horticultural Society.—August 17.

Mickleover Horticultural Society.—July 30.

Bolton Chrysanthemum Society.—November 18 and 19.

CATALOGUES RECEIVED.

MANSELL AND HATCHER, LIM., RAWDON, YORKS.—A catalogue of liliums and newly imported orchids. There are two large coloured illustrations each showing one flower, life size, of Lilium sulphureum and L. nepalense respectively.

BARR AND SONS, COVENT GARDEN.—A timely, well-arranged, interesting, and useful catalogue of hardy perennials, alpines, aquatics, shrubs, etc. The catalogue is illustrated and descriptive.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE GARDENERS' ATTENTION will now be occupied with the cleansing of Fruit Trees and Plants. The dormant season is the time to wage war against Mealy Bug, Scale, etc. These pests can speedily be got rid of under glass by the use of XL ALL NICOTINE LIQUID INSECTICIDE. For preparing Fruit Trees and Bushes out of doors for a clean, healthy start next spring, nothing is so effectual as a good spraying after the leaves have fallen, with RICHARDS' XL ALL WINTER WASH, which will destroy American Blight, other insects, moss, etc., and make the bark clean and healthy. Can be obtained everywhere from the Horticultural Trade. G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.

WEST FIELD HOUSE, RICCALL.

TO BE SOLD BY AUCTION, by MESSRS. RICHARDSON and SON, at the SWAN INN, SELBY, on MONDAY, the 11th of April, 1910, at Half-past Three o'clock in the afternoon, in two Lots, and subject to the General Conditions of Sale of the Yorkshire Law Society, and to such Special Conditions of Sale as will be then read, the under-mentioned valuable

FREEHOLD PROPERTY,

namely,

LOT 1.

COMMODIOUS DWELLING-HOUSE AND MARKET GARDEN, containing more or less four acres and twenty perches, and now in the occupation of Mr. E. D. Lumb.

LOT 2.

Well-built COTTAGE, pleasantly situated near to Lot 1, and with a good Garden adjoining, in the occupation of Mr. G. White.

Lot 1 consists of a substantially-built Dwelling-house, with two Front Rooms, Kitchen, Dairy, Pantry, etc., four Bed-rooms, large Attic, and the necessary Out-houses. Also Stable, Cow Shed, Pig Styes, Barn, Fodder-room, Cart-shed, etc., together with the Market Garden. The Land is excellent sand, very productive, and considered one of the earliest gardens in the district. It is well stocked with young Fruit Trees of the best varieties and in full bearing, together with Rasp, Logan, and other Berry Trees.

Lot 1 will be sold to include the whole of the Fruit Trees and Market Garden Tenantright.

Lot 2 contains Front Room, two Living-rooms, Dairy, three Bed-rooms, and the necessary Out-houses. Also Loose Box, Stable for two horses, large Pigstye. There is a good Garden adjoining.

Both the Lots are within five minutes' walk from Riccall N.E.R. Station, and adjoin the high road from Riccall to Cawood.

The two Lots have a good supply of water.

Further particulars may be had from the Auctioneers, Selby; or from

PARISH OF SAINT LEONARD, SHOREDITCH.
COTTAGE HOMES, HORNCHURCH.

FOSTER-FATHER (GARDENER) and FOSTER-MOTHER.

THE Guardians of the Poor of the above-named Parish invite applications from married couples (without children living with them preferred) for the appointments of Foster Father and Foster-Mother at one of the Cottages comprising these Homes.

The husband must be a SKILLED GARDENER, and he and his wife will be required to take charge of a Cottage capable of accommodating 32 boys, and be competent, the man to cultivate, with assistance, extensive vegetable and flower gardens, and to teach gardening, and the wife with the assistance of the boys to perform all the domestic work of the Cottage.

Salary for the Foster-Father £34, rising £2 annually to £42 per annum, and for the Foster Mother £22, rising £2 annually to £28 per annum, together with board and apartments, and an allowance of £3 per annum each in lieu of beer, should it be desired.

The appointments will be made subject to deductions under the Poor Law Officers Superannuation Act, 1896.

Applications upon forms to be obtained at my Office, as under, by forwarding a stamped addressed foolscap envelope, or by personal application, are to be made to me on or before Monday, the 18th inst.

None but persons whose characters in all respects will bear the closest investigation need apply.

Further particulars can be obtained upon application to the SUPERINTENDENT OF THE HOMES, which are near Romford, Essex.

Canvassing the Guardians is prohibited, and will disqualify candidates.

By order,
ROBERT CLAY,
Clerk to the Guardians.

NOTES OF THE WEEK.

Vandalism at Camberwell.

If there be any part of London in which the utmost care should be taken of the arboreal features it is surely in the congested districts south of the Thames, where every vestige of tree life is important, provided it does not interfere with the free access of light and air to the dwelling-houses and other buildings. It therefore comes somewhat as a shock to find trees so lopped in a district such as Camberwell as to give rise to a brisk discussion, and to justify much of the criticism of the methods of procedure. In the borough of Camberwell there is an interesting thoroughfare known as Camberwell Grove, which was described in appreciative terms by Ruskin in "Præterita." The "Grove" is of considerable length, is flanked by houses of various styles of architecture and sizes, and the sides of the road were many years ago freely planted with trees. These are not less varied than the elevations of the houses, but they might, by judicious thinning at an early period, and careful management, have been converted into a grove worthy of the name. Originally planted too close together, and left pretty much to themselves, they, in conjunction with the trees in the small gardens, form, during the summer months, a mass of foliage that must seriously interfere with the access of light to the houses. Some of the trees are as high as the tallest of the houses, and a portion appears to have been cut back at a rather early stage, and then allowed to grow unchecked, while others have not been touched by the pruning knife until the present season. The general effect is consequently decidedly unsatisfactory. Some amount of pruning has been done in Camberwell Grove, and if there is not much that justifies serious complaint, there is nothing that merits praise. It is difficult, if not impossible, to understand why certain trees have been pruned while others have been untouched, and why some branches have been removed and others allowed to remain. One point is quite clear, and that is the wounds caused in sawing off the branches should have been made quite smooth, with knife or other sharp tool, and painted over with Stockholm tar to prevent spores of fungi injurious to tree life effecting a lodgment, and, in process of time, setting up a diseased condition within the tissues of the trees. That this simple, yet important, precaution was not taken is all the more surprising, because, according to the Town Clerk, the "expert" under whose orders the work has been done, was recommended by Kew. The really serious act of vandalism is that which has been done in Grove Park, where about one hundred and twenty handsome planes have been converted into objects that have a strong resemblance to clothes props, and are certainly not more attractive. Grove Park is a small residential area, with three roads and handsome houses of medium size. The roads and pathways are broad, and the houses stand well back from the boundary line, so that the planes would have to attain to a large size before unduly shading the road or interfering with the access of light to the houses. The trees were planted widely apart about fifteen years ago, and, judging from the size of their trunks and the diameter of the stumps of the branches, had pyramidal heads eight or nine feet in diameter. They could, therefore, not have interfered with either light or air, or cast otherwise than the lightest shade on a portion of the gardens, and that only for a short time of the day. A correspondent who is well acquainted with the trees, states that last summer "the plane trees afforded a beautiful and pleasant shade, and were in the most flourishing condition, the delight of all who walked in the park." Proceeding, he writes: "A large party of men in the employment of the Borough Council were set to work, and in a few days every one of these plane trees were shorn of all their branches and even the possibilities of new growth, to the disgust of the residents." No wonder the residents should have been disgusted to see the handsome trees so maltreated. The trees have had their branches cut back to within from six inches to three feet six inches of the trunk, but there appears to have been no guiding principle by which one stump should have been left longer than the others on the tree. It might have been desirable to shorten a branch here and there to preserve the contour of the trees, but the trees could not have "grown quite out of hand," so that "lopping was absolutely required," as asserted by the Town Clerk in his futile attempt to justify what has been done. This official, who describes himself as "a lover of trees," admits that "many trees look ugly now," and as they are all equally objectionable to the eye, it would be interesting to know which of them he regards as objects of beauty. Having enlightened us upon this point, he will probably explain in what respect "the result of the surgical operation will be an improvement both as regards beauty and utility." The fact that the Camberwell Borough Council has within the past few months planted 7,000 trees and shrubs in the roads and open spaces in the area under its control is no proof that the members of the body appreciate trees. It rather shows how desirable it is that ratepayers, and, indeed, all who are interested in trees in their relation to town life, should see that when large sums of public money have been expended upon trees they should be protected from mutilation. The lopping that has been done in Grove Park is by no means the only evidence of a failure to properly appreciate trees and their requirements. Some years ago wire netting was fixed round the trunks for the purpose of protecting them from injury, and on a considerable number of them this wire still

MR. SAMUEL HEATON,
Horticultural Instructor to the Oxfordshire County Council.

remains, apparently without anything having been done to allow for the expansion consequent on growth. In the trees that we examined the wire is stretched very tightly over the trunks, and in several it is becoming embedded in the wood. We learn that the Council has just appointed a new park superintendent, and we trust that, as one result, other trees in the borough will escape the fate that has unhappily befallen the planes in Grove Park.

Mr. Samuel Heaton, horticultural instructor to the Oxfordshire County Council, is a man of strong personality and determination, and one who has made his way in the horticultural world by dogged perseverance. He was born at Keighley, in Yorkshire, and served his apprenticeship in the gardens of Oakworth House, where for seven years he took a share in the work of all the departments, and devoted his leisure hours to the study of botany, chemistry, drawing, mathematics, and languages. He served as foreman at Ashley Bank, Darwen, and was head gardener successively at Dilworth House, Longridge; Clarge House, Halifax; and Elmwood House, Batley; and during this time he was a successful competitor at the northern shows. Meanwhile, Mr. Heaton carefully studied agriculture, and so, when in 1891 he became teacher of botany and agriculture at Batley Technical School, and received an appointment at the Yorkshire School of Horticulture, he was splendidly equipped for his task. Teaching was, and is, to him, a second nature, and his new appointments opened up a wide vista of opportunities. In 1893 Mr. Heaton was appointed horticultural instructor to the Isle of Wight County Council, where he served seven years, and his work and energy are held in very grateful memory in the garden isle. From the Isle of Wight Mr. Heaton went to Oxfordshire, where he now carries out his duties with a skill, tact, and energy that commands the admiration of all who have opportunities of seeing his work. He is very keen on school gardening, and has the happy knack of imparting his enthusiasm as well as knowledge to the boys and their teachers. He has also, in conjunction with Mr. Percy Elford, the secretary of the Oxfordshire Education Committee, produced an exceedingly useful book entitled "Practical School Gardening," that is of the greatest possible value to all who are interested in the instruction of school lads in the practices of horticulture. We have much pleasure in presenting Mr. Heaton's portrait to our readers in the present issue.

March Sunshine.—As our weekly records have shown, the bright sunshine registered during the month of March was above the average. At Westminster the total amount registered was 110 hours, or 41 hours in excess of the average. This record has been exceeded only three times during the past twenty-seven years. In March, 1893, the aggregate sunshine was 113 hours, and in the corresponding month of 1894 and 1907, 140 hours and 152 hours respectively. During the three months ended March 31 there were 199 hours of bright sunshine, or 77 hours in excess of the average.

Rothamsted Experimental Station. — The annual report on the work at Rothamsted during the past year is of much interest to those who are concerned with the cultivation of the land. It conclusively shows that the experimental work that was so long carried out by the late Sir John Lawes and Dr. Gilbart is being continued with exceptional success by the present director, Mr. A. D. Hall, F.R.S. Recently it has been the desire of the committee to obtain additional funds for the extension of the work of the station, and a considerable sum has been obtained for that purpose, but it falls considerably short of the necessities of the case. The field experiments which began in 1843 have on some of the plots been continued without break or alteration up to the present day. The continuance of the experimental plots at Rothamsted, without any change, is regarded as of the utmost importance, as nowhere else in the world does such data exist for studying the effect of season and manuring upon the yield and quality of the crop, and for watching the progressive changes which are going on in the soil. The maintenance of the old data throws a heavy burden upon the station. For instance, there are 210 plots, and every year 243 samples have to be taken with proper precautions and put into store for future reference. In addition there are made 486 determinations of dry matter, 243 of ash, 170 of nitrogen, 50 of phosphoric acid, and 24 of potash, also 180 determinations of nitrates, etc., in rain and drainage waters, and 17 botanical analyses of hay. This does not include examinations of soils, the complete grass separations, and other extensive series of determinations which are made at longer intervals.

National Vegetable Society.—Those who purpose taking part in the competition for the large number of prizes offered at the exhibition of the National Vegetable Society, to be held at the Royal Horticultural Hall on Wednesday, September 28, are reminded that the schedules are now ready, and may be obtained from the hon. secretary, Mr. E. G. Quick, Kelmscott, Harrow View, Wealdstone. The schedule contains fifty-nine classes, and in these ample provisions have been made for cottagers and smallholders, as well as for amateur and professional gardeners. There are fourteen classes for collections, and the first of these is for twelve kinds, with a first prize of £10 10s., given by the Duke of Portland, president of the society, and the second of £7 7s., by Lord Howard de Walden. Mr. G. Wythes, V.M.H., the treasurer of the society, wishes us to state that his address will for the future be Bovingdon, Herts.

Daffodil King Alfred.—In the arrangement of the immense display of blooms of this fine daffodil, which formed such an attractive feature of the exhibition held by the Royal Horticultural Society on Tuesday, Messrs. James Carter and Co. surpassed themselves, and set an example that will not be easy to follow. The display is described in our report of the exhibition, and we need only mention here that the whole of the several hundred blooms were splendidly developed, and that the taste evinced in their association with dark foliage and bright green grass well merits the warmest praise.

French National Chrysanthemum Society will this year hold its annual congress at Paris, the dates fixed being November 4, 5, and 6. In conjunction with the congress the National Horticultural Society of France will hold an international exhibition of chrysanthemums. The programme of the congress is as follows: 1, Consideration of a portable colour chart; 2, Influence of the time of propagation and of stopping on the time of flowering; 3, Insects and diseases that affect chrysanthemums; 4, The "damping" of chrysanthemum blooms, and the best means of prevention; 5, Organisation of systematic trials of manures in the cultivation of chrysanthemums in open borders; 6. History of the chrysanthemum; and, 7, The packing of chrysanthemum blooms.

Study of Protoplasm.—We learn from "Nature" that Professor J. W. H. Trail, F.R.S., recently offered to the council of the Linnean Society a sum of money for the purpose of encouraging the study of protoplasm by means of an award to be made periodically. This generous offer has been gratefully accepted, and a special medal has been struck in bronze for presentation with the award, bearing on the obverse a portrait of Linnæus, and on the reverse the words "Trail Award," and the name of the recipient in a wreath. It is proposed to make an award about once in every five years for original work bearing directly or indirectly upon the "physical basis of life," and, in accordance with the wishes of the donor, a wide interpretation will be given to the scope of the investigations. The first recipient of the award will be Professor E. A. Minchin, professor of protozoology in the University of London, whose researches on sponges and protozoa have done so much to advance our knowledge of protoplasmic structures, and who is also the translator of Professor Bütschli's well-known work on protoplasm

Cypresses for the German Emperor.—We are informed that the Earl of Pembroke has presented Emperor William of Germany with a dozen fine specimen Italian cypresses. These specimens have been forwarded from the famous gardens at Wilton House, Salisbury, where they were greatly admired by the Emperor during his visit when he was last in this country.

Children's Flower Show at Dunfermline.—The fifth children's flower show, held under the auspices of the Carnegie Trust, took place recently in the Dunfermline Drill Hall. There was a wonderful display of spring-flowering bulbs grown by the children of ten different schools, and the collections of drawings showing the development of the plants was exceedingly good. There were 1,057 exhibitors, and 1,988 exhibits, as against 954 and 1,798 respectively in 1909.

Elstree Horticultural Society. This society is only in its second year; but its enterprise and usefulness might well be the aim of many older societies. The society appeals to a fairly wide gardening district, and its membership includes all grades of gardeners and garden lovers of both sexes. Its meetings for the discussion of horticultural subjects during the winter are held in several places, and so local interest maintained. The society is fortunate in having the Hon. Vicary Gibbs as president, Mr. Edwin Beckett as chairman of committee, and Mr. W. J. Pritchard as one of the hon. secretaries, but there are other districts as fortunate in the possession of horticultural celebrities, but where, alas! these despise local effort. The society is holding two exhibitions this year, one in Aldenham Park, on July 13, and the other in the School Room, Elstree, on September 17, this latter being devoted to fruits and vegetables. The schedule is thoroughly well produced, and a credit to all concerned.

R.H.S. Gardens Club.—The annual meeting of the members of this club will be held at the Royal Horticultural Society's gardens, Wisley, on Saturday afternoon, June 11.

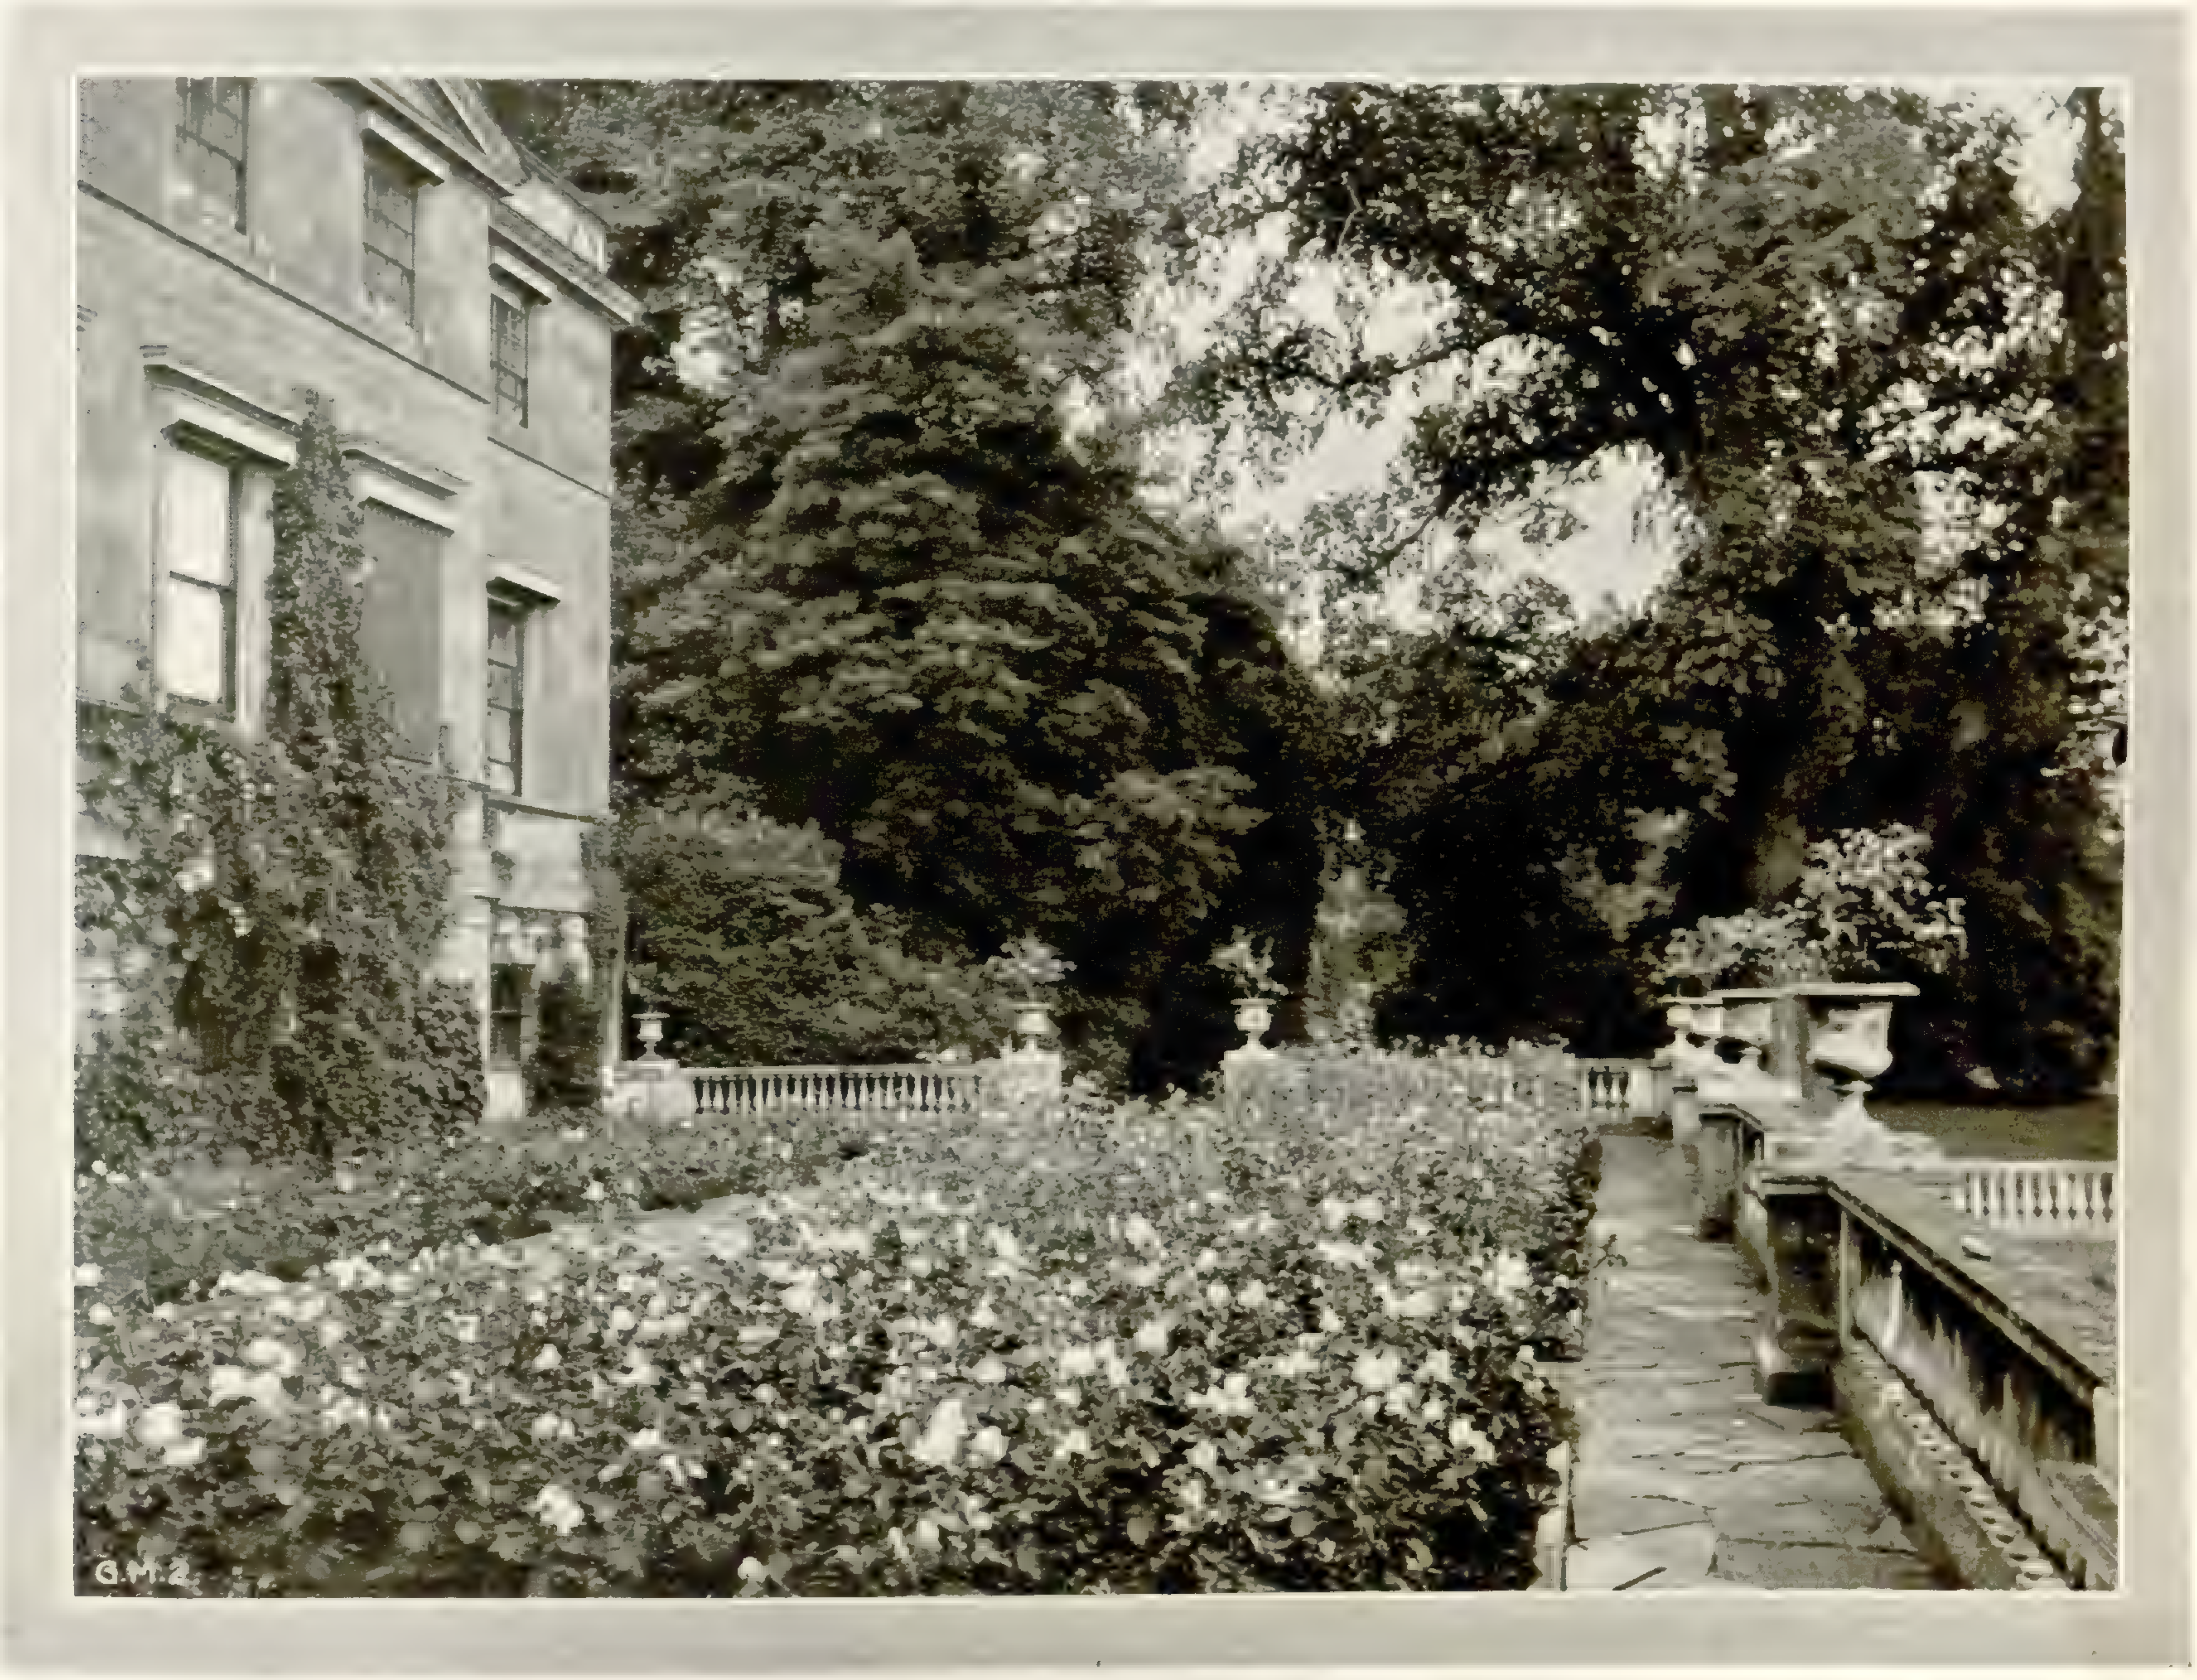
Evolution of Parasitism in Fungi.—In a paper contributed to the Linnean Society by Mr. George Massee, V.M.H., on this subject, the author stated that to understand clearly the evolution of parasitism it is important to grasp a fundamental point in the evolution of fungi generally. The most primitive forms were aquatic, and reproduced by zoospores, which necessitated the presence of water to secure their dispersion. As the fungi gradually took possession of dry land, a second asexual or conidia form of reproduction, suitable for dispersion by wind, etc., was gradually evolved. This supplementary conidial condition is always the form that has assumed a parasitic condition, the older sexual phase remaining as a saprophyte, and developing when the host is exhausted. Parasitism is mainly the outcome of opportunity, and the fact that fungi present all stages of parasitism, and that a saprophytic fungus can be educated to become a parasite, proves that parasitism is an acquired habit. Incipient or imperfectly evolved parasites promptly kill the host, and consequently curtail the period of their own existence, as Pythium De Baryanum. A higher stage of parasitism is reached by many of the rusts and smuts, Ustilago avenae, etc., where the host is attacked as a seedling, and is stimulated to an unusual condition of growth throughout its normal period of development. More advanced parasites show a tendency to arrest the production of spores and conidia, and to perpetuate themselves by perennial mycelium located in some perennial vegetative portion of the host (root, tubers, etc.) or in the seed. In the most highly evolved parasites reproductive bodies are entirely arrested, and the parasite is perpetuated by hibernating mycelium only.

Black Scab or Wart Disease of Potatoes.—During the autumn of last year the Board of Agriculture carried out an inquiry into the distribution of this disease in Great Britain. According to the "Journal" of the Board five inspectors visited suspected districts, and urged potato growers to report cases of disease. A large number of letters were received from occupiers and others reporting the presence of wart disease. From an examination of the available information it appears that wart disease is almost entirely confined to an area including Lancashire, Cheshire, Shropshire, Staffordshire, and those parishes in Warwickshire and Worcestershire which immediately adjoin Birmingham. Within this area most parishes contain one or more allotments or gardens in which diseased potatoes were found, though in only a few cases were the field crops affected. Wart disease has also spread beyond this area in patches among the parishes that lie round it. Westward of the affected area the disease has spread in patches into Wales, appearing in the counties of Brecon, Cardigan, Carmarthen, Carnarvon, Denbigh, Flint, Glamorgan, and Merioneth. Wart disease has also spread northward beyond the infected area in patches. Cases in Cumberland, east Dumfriesshire, in north-west Ayrshire, and in two small areas, one including Clackmannan, south-west Perth, east Stirling, and south-west Fife, and the other, central Fife and Kinross. It appeared also in the neighbourhood of Edinburgh. In nearly every case the disease is confined to allotments and gardens.

ROSE FRAU KARL DRUSCHKI.

If this fine rose is not perfect, because of its lack of fragrance, it has so many good qualities that there is no occasion for surprise it should have attained to a high degree of popularity and obtained by far the greater number of votes in the competition two years since for the Nickerson cup, offered for the best white rose of dwarf growth. Had it failed to obtain this distinction for its raiser, there would have been good cause for perplexity in the minds of those who are well acquainted with its characteristics, that it should have failed to be regarded with the favour that is unquestionably its due.

Except for the absence of fragrance, Frau Karl Druschki is as nearly perfect a white rose as the most sanguine of rosarians can hope to see. The growth is strong and healthy, the leafage ample and deep in colour, and the large finely-formed pure white flowers are produced freely from early in summer until the closing days of autumn. Whether for exhibition or for decorative purposes, the blooms of this variety are quite unsurpassed by those of any other white rose at present in cultivation; and they are so plentifully produced that from a moderate number of plants several dozen blooms can be cut at any time during the season. These are charac-



[Photo: W. J. Vasey.

THE BEAUTIFUL PURE WHITE H.P. ROSE FRAU KARL DRUSCHKI,
As grown at Nuneham Park, the seat of L. Harcourt, Esq.

teristics of first-rate importance, and there are others not less noteworthy. The growth is such that the plants can be grown with success as standards and dwarf bushes, and they form most effective beds when the long shoots are at the spring pruning shortened and then brought down and securely fixed in a horizontal position. Growths so brought down produce flowers throughout their length in the course of the season, and after flowering they are cut away to make room for the new growths that have risen in their midst. At Kew this rose is grown with much success under the pegging-down system. At Nuneham Park, Abingdon, the seat of L. Harcourt, Esq., Mr. Munday, the head gardener, has been highly successful in its cultivation as a bedding rose, as evidenced by the fine example that we have the pleasure of illustrating herewith.

Fourteen years have elapsed since Frau Karl Druschki was raised as a seedling by Mr. Peter Lambert, and, notwithstanding its outstanding merit, it was not until some five years later that it obtained recognition from the general body of rosarians. In the year 1900 it was staged at an exhibition held in Trier in competition for a £50 prize, but the award was made to a rose of which we have not heard, and when first sent to America it was regarded with but little favour. It was raised from seed from Merveille de Lyon, a white sport from Baroness Rothschild, the pollen-bearing parent being Caroline Testout, well known as one of the finest of the pink roses for garden decoration.

In common with other roses that are vigorous in growth and profuse in flowering, a deeply worked and well enriched soil is essential to the full development of leaf and bloom. This being the case, the bed should be deeply dug and liberally manured previous to planting, and each year subsequently a moderate dressing of manure should be applied and lightly forked in the latter part of the autumn or in February.

PRUNUS TOMENTOSA.

This shrubby prunus belongs to the apricot section of the group, and is characterised by free-flowering propensities and a naturally shapely habit. It is a native of China and Japan, and a figure of it appears in Siebold and Zuccarini's "Flora of Japan," vol. i., p. 51, t. 22. In light loamy soil it grows rapidly, and in five or six years attains a height of three to four feet, with a spread of four to five feet. A large proportion of long, twiggy branches are formed, which bear flowers from almost every bud. These flowers are white, slightly flushed with pink, and are about half an inch across. They are, however, of a rather fugutive character, and are easily damaged by heavy rain.

Given mild weather during the flowering period in mid March, and no heavy storms of rain or hail, the bush is in good condition for a couple of weeks. Fruits are borne sparingly in England, but plentifully in its native countries. They are scarlet in colour, the size of a small cherry, and shaped like an apricot. In China and Japan they are said to be eaten. The leaves are oval, and very hairy, particularly on the under surface. Like other of the dwarf prunuses, this one may be increased by means of cuttings during summer. When selecting a position for this shrub care should be taken to provide one which is well sheltered from rough winds, and a light, warm soil is preferable to ground of a heavy clayey character.

W. D.

AMONG THE ALPINE FLOWERS.

"The sap will surely quicken soon or late,
The tardiest bird will twitter to a mate;
So spring must dawn again with warmth and bloom,
. . . . .
Sing voice of spring,
Till I, too, blossom and rejoice and sing."
Christina C. Rossetti.

We have deemed this a long and dreary winter, and we have ofttimes peered out among the driving rains or have trodden the frozen paths thinking gloomily of the trials of our favourite flowers, condemned to endure the vicissitudes of our winters with all their changes, when they would have been happier far under a coverlet of snow, or in the sunlight of their native lands. Our gloom has, alas! not been misplaced, so far as some plants are concerned, and as we look around we see traces of the bitter ordeal flowers have undergone. A few are seared, as if by fire, while others show traces, more or less unmistakable, of the stress of the times. But, as a whole, our alpine flowers have risen above the sufferings of the time, and their opening buds and stretching shoots, and fresh green leaves, all preach to us the homily of peace and sober, yet glad, pleasure. From slope and pinnacle, from high terrace to the moist bed at the base of the alpine garden, there spring green shoots, with bright buds and charming blossoms, all proclaiming that spring has come, with its delights to all the lovers of Flora's fascinations. And so we look amid our plants and our flowers, seeking, not in vain, for some beauties of the time.

Narcissus minimus.

Late this season, the quaintly pretty little Narcissus minimus only came with the winds of March, and it was with pleasure that we saw these little trumpets of gold open amid the greenery of the rock garden. An envious slug, or one not yet satiated with more common fare, deprived us of some of the blooms, or disfigured their beauty by feasting upon a portion of their fabric, and so our clumps of the Tom Thumb of trumpet daffodils are not so pretty as they usually are. Yet they delight us with their neat and curiously shaped little trumpets, very miniatures of the great trumpet daffodils which gaily nod to the winds in the borders or on the grass. N. minimus is a revelation to those who see it for the first time. Compared with it N. nanus and N. minor are leviathans, and for rock gardens N. minimus is one of the indispensable flowers, especially when so placed as to be near the level of the eye.

Synthyris reniformis.

Out-pacing the latter in the race for priority among the garden flowers, yet not the first blossom of the year by a long way, comes Synthyris reniformis, giving us in its early stages a bright bit of blue in the rock garden. It passes off a little duller in tone, but is, all the same, a cheery little thing, and is one of the few non-bulbous flowers which seem to reck but little of the winter's evil ways, although its birthplace is in the mild west of the United States and the Canadian coastline mountains. With its pretty kidney-shaped leaves, all toothed and saw-like in their notched margins, and polished as if by varnishing, tucked snugly together to wait for a milder time, it sends up its little racemes of flowers, looking, in these early stages, like little grape hyacinths. Then these racemes lengthen, and the flowers expand, showing their anthers and stigmata, and the leaves gradually open up and give us a fresh feature of pleasure as we look upon the plant. A lover of the sun with me, yet this synthyris does not approve of drought, and likes plenty of moisture, and a loamy and gritty soil, with stones about it to keep it cool.

Hyacinthus lineatus.

Some years ago I procured from Asia Minor a few bulbs of what was called Hyacinthus lineatus, a near ally, in appearance, as well as in blood, of Hyacinthus azureus, and I have never regretted the investment. It has given me an ample source of pleasure, as fresh now as when the bulbs first sent up their little sky-blue spikes, or, rather, racemes, in my garden. They have increased in numbers, and now, nestling by a spreading bush of one of the sun roses, which, by the way, requires occasional pruning to keep it in bounds for the annual reappearance of the hyacinth, they afford me flowers from January until [illegible] into March. This year the synthyris will probably last into April—no brief span of beauty for a little spring flower like this. The unknowing speak with glee, as they see it, of this dainty little "grape hyacinth!" and we forgive their want of knowledge, inasmuch as the distinction between the muscari-like racemes of this little flower and those of the hyacinth are not always obvious, save to the expert. But it is a charming little flower, worth more than its room, and making a good group only some three or four inches in height, and delighting in a sunny place, in grit and loam.

Other Flowers.

But what of other flowers? Have we not many of these, late as is the season beyond what we usually anticipate?

As we roam along the paths we see Burser's saxifrages in different varieties, such as gloria and speciosa, grandiflora, and others of the clan. Elizabethæ, too, and the Boydi class, with apiculata, and some others, have opened little flowers on their beautiful spiny foliage. "Grey and green cushions decked with floral embroidery," is a cold effort of the imagination to convey a picture of these sweet little flowers.

Then, as for snowdrops, these have lingered long indeed, and well beyond the middle of March some were yet to open in a large collection. "The early herald of the infant year" has overslept himself, and a good many other flowers have formed the vanguard, and have marched on before the "herald," or side by side, as if to guard it from climatic enemies.

Snowflakes, flowers of intense beauty, have nodded to the winds, and have for long defied the weather. Some of the chionodoxas, or Glories of the Snow, have given their exquisite flowers to company the others, and the earliest scillas have come cheerily to the fanfare of this herald. Winter heaths, mezereon, primroses, polyanthuses, a few plants of Viola [illegible] and other gems of the time, have striven to sweep aside the cloud of gloom which a long winter so infallibly brings to the lover of flowers. They have not striven in vain, and we are cheered and uplifted by the vision of the flowers into a clearer and a brighter mental atmosphere, gladdened by the blossoms of the time, and filled with hope and confidence to await the full flush of vernal and summer glories.

CULINARY PEAS.

Professional gardeners require little instruction as to the cultivation of culinary peas, nevertheless there are a few points of special importance which are often lost sight of by those who have not made a speciality of the cultivation of these fine vegetables.

It is useless to attempt to grow early peas unless a really warm, sheltered aspect is obtainable, and even then special care must be taken in the preparation of the soil, so as to increase its normal temperature by thoroughly incorporating with it a dressing of short manure. To sow early peas in open situations and on cold soils is a waste of time and labour. A too common mistake with the main crop of peas is to sow them in rich soil, and frequently we find that on retentive soils heavy dressings of farmyard manure are applied previous to preparing the ground for sowing; except in seasons of drought this practice is rarely a success, as where the ground remains moist throughout the growing season an excessive growth of haulm is produced at the expense of well-filled pods. Ground manured for a previous crop, as, for example, cabbage, will usually carry a full crop of good quality peas.

I have often seen it advocated that peas should be sown in double rows, at even distances apart, not only in the rows, but from pea to pea in the rows. This method does not always answer in practice, where many enemies, such as mice, sparrows, snails, and numerous other pests are to be accounted for; therefore, it is usually found preferable to sow broadcast in a wide drill drawn with the hoe, and should the plants appear too thick before staking it is a simple matter to thin them out. There are occasions when it is necessary to cultivate peas on soils altogether unsuited for their growth, as on soils of light texture. When this is the case, it is often advisable to take out a trench and mix a good mulching of rotten cow dung and loam with the subsoil, replacing the original soil on the surface as the work proceeds; then sow the seeds, and finally give a surface mulching with a similar mixture when the plants show flower. The only aids in keeping pests from the seed is to damp them, and cover with a coating of red lead previous to sowing, after which guard with black cotton until the plants are large enough to admit of staking.

Neatly staked rows of peas are always pleasing to the eye, and usually indicate that other cultural details are being well attended to. There are no better sticks than the branches of hazel when cut from the copse in winter, as they are more or less fan-shaped and well furnished, and in woodland districts cost very little to purchase. The sticks should first be prepared and graded according to the height of the varieties for which they are intended, as this facilitates much labour when they are brought into the garden. After staking the tops should be cut off level, the twigs thus removed being used for filling up the bottoms of the rows, where the sticks are not usually so well furnished. When staking is completed the surface soil should be drawn up with a spade along the side of each row; not only does this give the rows a neat appearance, but also affords shelter.

It is a mistake to be continually watering peas, and if the soil be fairly retentive of moisture it should only be necessary to give a good soaking at the time of flowering, followed by one or two heavy waterings to carry them on through a period of drought, if such should occur when the pods are filling. If such waterings are made through a mulching so much the better. As the object of home-grown peas is to ensure quality, which, in this particular vegetable cannot be relied upon when purchased, it is important therefore that great care is taken when gathering the pods, and if this work is well performed there will be no risk of gathering old pods or those that are under-developed; further, the timely removal of fully-matured pods will assist the younger ones to mature more readily. When gathering is completed the sooner the haulm is removed and burnt the better, as too often it is left to become infested with mildew.

CHRYSANTHEMUM CAPRICE DU PRINTEMPS.

In a 48-sized pot; flowers large, rosy-pink.

There is just that tendency with all growers to cling to what we know to be a really good sort, but it so happens that in a few years what may have been our choice of former days is superseded by a variety of better quality; again, there is the question of strain, as, for example, strains of Duke of Albany pea are not uniform, and so with other varieties. Each year it is well to scan very carefully the seed lists of the seedsman we may choose to deal with, and, to a great extent, be guided by his recommendation. If convenient, several new varieties may be introduced for trial each season. What may prove good in some soils may be regarded as indifferent doers in others.

Up to the time of writing I have found the following very useful: Gradus, which rarely grows more than three feet, and produces the largest pods of any of the early varieties; Ideal, another useful early pea, being of excellent flavour, and a special favourite for early exhibition; Daisy, still worth a place as a dwarf second early, being a heavy cropper, and rarely attaining a greater height than two feet; Sutton's Prizewinner, a beautiful second early pea, the pods often measuring six inches in length and containing as many as twelve peas; it rarely exceeds three feet. Of maincrop varieties, Alderman, Autocrat, Duke of Albany, and Ne Plus Ultra are all still very useful. For exhibition, Captain Cuttle is a favourite with many, the pods being large and very handsome, and usually containing ten large deep green peas of excellent flavour. This variety has the advantage over many main crop varieties inasmuch as it resists mildew. Sutton's Exhibition is another good variety frequently exhibited; it is of the Duke of Albany type, the pods being larger, and even broader than that variety. Of late years, no pea has become more popular than Gladstone, and for late exhibitions it has no rival, and therefore takes a prominent place in all August shows; its dark green curved pods present a very handsome appearance, and the peas are usually closely packed in each pod to the number of eleven to thirteen. No grower can afford to be without this variety.

J. C. Newsham.

DECORATIVE CHRYSANTHEMUMS.

There is a great host of chrysanthemum lovers and growers who do not consider their favourites from an exhibition point of view, but regard them as charming flowers for conservatory and room decoration during the autumn. Even those who do exercise their skill in the development of big specimen blooms know full well the value of bush or decorative chrysanthemums, especially where there is much decorating to be done, and many flowers to be provided; but to the amateur who has no lofty glasshouse in which to place tall specimens, the culture of decorative varieties in bush form in small pots affords a delightful outlet for his skill and enthusiasm.

CHRYSANTHEMUM KATHLEEN THOMPSON.
In a 48-sized pot; flowers large, crimson, tipped with gold.

No special difficulties present themselves in this method of culture, and if close attention is paid to watering and feeding the rest of the practice is very simple. It is a great mistake to start early for the production of dwarf, bushy, freely-flowered pot specimens, and this must be one of the very few instances in horticultural procedure where an early start is a mistake. Old stock plants should be kept quite cool during the winter, so that there is no wastage of growth. After the large-flowered varieties have been propagated, potted, and are well on the way towards success, it will be time enough to begin propagating for bush plants in small pots. The end of March and the first half of April is an excellent time to take the cuttings, and in the genial warmth of a greenhouse or warm frame the cuttings root quickly.

Several cuttings may be placed in a 60 or 48-sized pot, and potted off singly into thumb pots, as soon as rooted, and stopped. From thumbs they should be transferred to 60's as soon as nicely rooted, and early in July they should be ready for the final shift into large 48's. The growths must be stopped two or three times, but the plants must be only once stopped after the final potting. A cold frame, with abundant ventilation, will provide sufficient shelter after the young plants are potted from the store pots, and every effort should be made to secure hardy, sturdy growth, so that when the plants are in bloom they are only about eighteen inches or two feet high, and carry from ten to eighteen blooms.

Directly after the final potting the plants will be all the better if stood out of doors in an open position, and plunged to the pot rim in a bed of ashes. They must have ample room for development, and for the admission of light and air among and around them. The potting material should not be so rich as that adopted for the production of large blooms, and sound, fertile loam should form the basis of the compost, adding a little bonemeal or dried cow manure if necessary, or sand and leaf-soil if the loam is rather heavy and adhesive.

Feeding should commence as soon as the flower buds have set, and should consist of frequent waterings with liquid manure and guano, using these in alternate weeks. Soot water occasionally is helpful, as it imparts a deeper green to the foliage and increases the purity of the floral colours. In a hot, dry summer plunging in ashes is almost essential to success, as the pots become so full of roots that if fully exposed to sun and air the root tips next the pot would be severely damaged if the soil were allowed to become at all dry. In a wet season extra care must be taken in watering, as there is then a little danger of harm resulting from an excess of root moisture.

Last autumn Messrs. James Veitch and Sons, Lim., Chelsea, exhibited large numbers of remarkably well-grown chrysanthemums at Westminster, and these attracted a great deal of notice, and were deservedly admired. All these were grown at the firm's Feltham nursery by the method already indicated, under the care of Mr. Weeks, one of those clever departmental foremen who for so many years have been with the Messrs. Veitch. The illustrations accompanying these notes represent some of the plants shown last autumn.

Disbudding is necessary in the case of all the larger-flowered varieties, and also for the larger singles, all these being restricted to one flower on each growth, but many of the singles may be allowed four flowers per growth, so that a profusion of sprays of shapely blooms results, rather than a confused mass of individually poor flowers.

Among the larger-flowered decorative varieties that prove eminently suitable for this system of culture the following is a severe selection: Soleil d'Octobre, yellow; Bronze Soleil d'Octobre, bronzy-yellow; Caprice du Printemps, rosy-pink; Kathleen Thompson, crimson, tipped with gold; White Cap, a white sport from the last-named; Parson's White, pure white; Hortus Toulousanus, apricot-yellow; Rose Poitevine, rosy-mauve; Hutchin's Pink, pink; John Shrimpton, crimson; and L. Canning, white; the two last-named are very late varieties.

A selection of the larger-flowered singles, all of proved value for bush plants in small pots, includes Edith Pagram, rose-pink; Bronze Pagram, reddish-bronze; the white and yellow sports from E. Pagram; Mersham White, white; Framfield Beauty, crimson; Pictor, blush-pink; Crown Jewel, yellow; Mrs. J. Miller, yellow, tint pink; Pollux, bright yellow; and Mensa pure white.

Single varieties that make beautiful bushes if the flowers are disbudded to form sprays are: Atair, white; Feltham W white, very free; Lily Godfrey, lavende Exmouth Yellow, golden-yellow; S Slade, rose and white; Ursa Major, pink; Norma, pink, early; Rou Beauty, red; Belle of Weybridge, ch nut-red; W. Grix, canary-yellow; Me magenta-red; Devonshire Lass, cana yellow; Miss Mary Anderson, blush; a Ladysmith, rose-pink.

Collingridge, 148 and 149, Aldersgate St London.

PLANT CULTURE UNDER CALICO.

Intensive cultivation of land is now under discussion everywhere, and how to make the best of every available inch it may be one's lot to cultivate. I hope to be able to explain in the following notes some of the uses to which calico can be put in horticulture, and at the outset I may say I have tried it for many subjects during the past eight years, and have found it very useful indeed. In the first place, it is very light and mobile, as well as being comparatively cheap compared with the cost of glass. I am prepared to admit that it is not so generally useful, nor will it take the place of glass, but some subjects will thrive so well under it that I strongly advocate its use.

I generally purchase calico at about $2\frac{7}{8}$d. to $3\frac{1}{8}$d. per yard, taking several rolls of about ninety yards each. The width is twenty-eight to thirty inches, and those pieces with strong texture and not much starchy dressing are selected. For general use I cut it into about thirty-five-yard pieces, and sew three pieces together with the machine, allowing a lap of about an inch, so, when finished, I have a sheet of thirty-five yards long by seven feet and a few inches.

For the building of one of my calico greenhouses I obtain a quantity of 2 x $\frac{3}{4}$ x 8 feet tile laths, and some of five feet in length, and these make frames five feet by eight feet, each frame containing five pieces of eight-feet lath and four of five feet lath, nailed together with $2\frac{1}{2}$inch wire nails. The eight-feet laths lie on top of the five-feet ones. It will require twenty-one of these frames on each side of our house, 42 in all. I next obtain eight pieces of timber 4 x 2 x 14 feet as a "top-rail," and lay it on the ground where the centre of the house is to be, putting the ends close together; at each end I drive into the ground securely a post of 4 x 2 inches, and about seven feet long, so that the top rails may each rest on it two inches, and be secured with one four-inch nail in each end. At the middle of the top rail I put another post of 4 x 2 inches crossways, to prevent the top-rail from tipping. We have now the centre of the house complete. For side rails a lighter timber may be used, and 4 x 1 inches is heavy enough, and posts 2 x 2 inches; the latter, instead of being six feet out of the ground should be four feet. The rail must be nailed up securely, and when completed we have three rows of posts eight feet apart, with a rail on each. In gauging be particular about having each rail exactly eight feet from the other, or the frames will not fit. The next business is to put the frames on, and secure them with one three-inch nail in each of the four corners, not driven quite home, but left so that it can be withdrawn without injury to the frames when the house has to be removed. When the frames are fastened the house looks like a greenhouse in course of construction.

Take the sheet of calico and draw it over the structure; roll one end round an eight feet 2 x $\frac{3}{4}$ rod, and secure this with two three-inch nails at one end of the building. Roll the calico round a similar piece at the other end, and nail down after pulling as tightly as possible. Do this on either side, and then stretch a single width of calico over the top of the house. Place some more lights, bottom upwards, on the house to keep the calico down, nailing them as before at the corners. The ends of the houses can be closed with calico fastened with some laths 1 x 3-16 inch. Where a house is exposed to wind it pays to put two colds on the top of the calico under the top lights. I use New Zealand two-ply, because it does not stretch unduly. The sides can be formed with wood, bags, Russian mats, tiffany, hessian, grey calico, or old calico not fit for the top put on double, and secured with sawn laths nailed on with inch wire nails.

For chrysanthemum growing I generally have three houses together, and use a spout between them. For this I ask the timber merchant to cut a fourteen-feet piece of 2 x 2 inches angleways, and then nail these angles on the top outside edges of the 4 x 2 x 14 feet.

I erect these in the same way as the top rails, and line them with roofing felt when erecting the houses. This makes them waterproof. Other adaptations of such a house will readily occur to a practical man. Frames can be made instead of houses, for instance.

CHRYSANTHEMUM LADYSMITH,

In a 48-sized pot; flowers single, rose-pink.

The great crop that is grown in these houses is chrysanthemums, and they succeed splendidly. Many growers cultivate their decorative varieties out of doors, then lift them, and either pot them, about September, or plant them under glass. I plant six rows, twelve inches apart, in the centre of the house, then leave eighteen inches as a path, then three more rows. About September, when early frosts are expected, I erect the houses, but put no calico on until really compelled to do so by wind, rain, or frost. Often it is not necessary to put the sides or ends on until late in November. The whole of the early ones will open fit for cutting with no other protection than the sheeting. If the calico is stretched tightly it carries off the water as well as a good umbrella, and when frost comes it freezes the moisture on the calico, so that it is a sheet of ice, through which no wind or air can pass, and thus it keeps out a good deal of cold. By heating such a house chrysanthemums may be grown till mid January.

For spring use calico is invaluable, when glasshouses are over full, and one does not know where to put half-hardy seedlings. A calico house is a great boon for pricking out asters, sunflowers, stocks, celery, etc.; it affords slight shade from the scorching sun, and protection from cutting winds or heavy rains, besides finding work under cover when the weather will not permit outside work being done. Chrysanthemum stools flourish all the winter, and the cuttings strike readily either in boxes or on nicely-prepared beds. In such houses a crop of winter parsley can be protected from the weather. I have sown quantities of aster and stock seeds with great success under calico, and, after taking the covering off for the growing period, put it on again when asters are in flower to keep the rain off.

Tulips and narcissi are a great success with this treatment, and for tulip, hyacinth, and narcissi forcing in quantity erect a house as already described, only lower by about two feet, and put another lot of calico on the underside of the lights. Benches of any rough wood are built, and some long litter put on them, and a very little soil; on these are placed the boxes or pots in which the bulbs are growing, and with an occasional sprinkling of water, and a day temperature of 60 degrees, flowers can be produced superior to anything under glass, both in colouring and length of stem. Under the benches rhubarb, seakale, and chicory can be grown. If bulbs are to be forced under glass it will pay to line the house with calico, as the subdued light gives a delicate colouring to the blooms that must be seen to be appreciated.

If it is not thought desirable for a house to be built, I should advise that the frames be made eight feet by five feet, and these be used as ordinary garden frames, but the calico can be stretched quite tight, and secured to each light with 3-16 x 1 inch sawn laths, so that we have lights of calico instead of glass, and under these frames cauliflower, lettuce, and parsley can be wintered, removing the lights altogether in open weather. When the lights are on more light will be admitted to the plants than when glass is used and covered with mats. When these plants are put into permanent quarters early potatoes may be planted, or annuals sown or pricked out. It may be found more convenient to fasten the calico to fifteen-feet laths, and roll it over a framework just as greenhouse shading is rolled. I have found that a bed of dahlias can be covered with the frames in September, and have sheeting thrown over them for two or three nights, and, as a result, they have been protected through the first frosts, and I have had plenty of dahlias till mid-November.

STUDLEY COLLEGE—A STUDENT AMONG THE CHRYSANTHEMUMS.

The heating of these structures, if necessary, is carried out by means of a conical independent boiler fitted with three flows and three returns, 1½ inch, screwed to take gaspipe. I have a quantity of 1½ inch, 1¼ inch, and 1 inch gas piping, with fittings of all kinds. In the autumn I put two flows and two returns in a thirty-five-yard long case, and one flow and one return, 1¼ inch in the midseason house, and when the house is cleared I take out the pipes.

After Christmas I fit up a forcing house, branching each flow pipe into two, and thus get five flows and the same number of returns in a forcing house, and a flow and return to run round a set of glass frames forty feet long, in which mint, radishes, and lettuce are growing. There is no difficulty about fitting such a boiler; the only requirements are a rise in the pipes to the air vents, and a fall back to the boiler, and that the supply cistern be higher than any other part of the system.

Terrington. W. J. Belderson.

BEAUTIFUL GATEWAYS.

It must surely have struck many thoughtful persons that we generally expend immense amounts of loving care and work upon the interior of our gardens, but leave the entrances unadorned. If there are carriage gates it is only on large estates that they are beautiful; if there is but one gate, set in wall, fence, or railing, the most we do is to plant a tree on either side of it. Now, an arched entrance is almost invariably charming, and the structure of wood or iron can support either climbers or trained trees; the usual laburnums and hawthorns take on quite a new loveliness when thus used. Of all possible adornments for an arch, or larger porch over an entrance gate, however, the most charming is probably Pyrus japonica; the vermilion blossom comes at a rather cheerless season, warms the whole landscape, and is not chary of repeating itself at later times of year.

Supposing there to be a space sufficient on the gate arch, or a series of arches, over the immediate path, it would be well to use the blush-white and the rosy varieties of the pyrus, in addition to the scarlet. In front of a white house this entrance way is seen at its best, and the walls of the dwelling should be partly climbed also by Pyrus japonica, so that the spring show may be as noteworthy as possible. So simple and cheap an arrangement as this is certain to achieve renown, it being watched for each year by neighbours and frequent passers by. A modern writer has truly said: "The things to look out for are little accidents of light and colour, little effects of chance grouping, the transfiguration of some well known and commonplace object"; but the gardener's happy task is the creation permanently of such beautiful combinations as chance may have revealed to him.

Porches or arches over entrance gates are occasionally objected to because they cause drip to fall upon the path; a glass-roofed porch will not do this much, and suits excellently with the somewhat ornate style of many verandahed modern villas; the supports should be white-painted wood or iron. Then this objection does not apply to pillars on either side of a gate, which look almost as well as an arch. The effect is best when these pillars are really tall, and especially is this necessary when the entrance is a broad one. Solidity of pillar must also be studied, and made to correspond with the size and nature of gate and fence; clumsy great poles beside delicately carved ironwork or fragile ones against massive wooden doors and fence are alike inartistic. Bamboo poles of sufficient size go well with the look of the red brick semi-detached villa; stouter larch poles are more in keeping with a house possessing a broader, more important front. Climbers should combine spring, summer, and autumn beauty whenever possible; there is the pyrus before mentioned, the various yellow jasmines, the wistarias, then Clematis montana, roses, ramblers, and those of more permanent excellence, clematises of the Jackmanni, lanuginosa, and other types, Clematis vitalba, to last right into November, and in warm places passion flowers and Solanum jasminoides. The worth of dainty kinds of ivy will be undoubted for perpetual covering.

Another method of beautifying the gateway is to have beds or borders of great width and importance about it, stretching some distance up the path, and to congregate in these shrubs and herbaceous plants, with roses and liliums, chosen so as to gather together as much constant florescence as may be. Hardy rhododendrons and Ghent azaleas, Daphne Mezereum, double herbaceous pæonies, hepaticas, double daffodils, polyanthuses, an Oriental poppy or two, delphiniums, phloxes, chrysanthemums, Japanese anemones, autumn crocuses, Cratægus pyracantha, golden privet, Berberis aquifolium, Sedum pulchellum, aubrietias, Christmas and Lenten roses, crown imperials, laurustinus, Stephenandra Tanakæ, a shrub that has fine autumn-tinted leaves and rich red stems in winter, Hydrangea hortensis, spiræas, deutzias, Erica carnea alba, the white winter heath, and hollyhocks, are a few of the ornaments that occur to memory as well fitted to take part in the groups.

It is an admirable plan to let narrow borders run alongside the path on either side, ending in these attractive shrubberies and beds; the practice of cutting a succession of small round beds, each to contain a standard rose, along the edge of the front garden turf has its merits, but the ribbon-like band of flower and foliage looks more uncommon. Only the choicest hardy plants should be used in this, and by employing great numbers of aubrietias, arabises, iberises, pinks, saxifrages, and other evergreen subjects the earth is pleasantly covered all the year round. When there have to be posts on either side of a drive to hold the staples and hooks for fastening back the gates, there is no reason why these should not be so tall as to become pillars that can be mounted by well trained roses.

M. H.

DAHLIAS TO PERFECTION.—A thorough [illegible] to the successful culture of these popular [illegible] "Dahlias and Their Cultivation," by J. B. [illegible] price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d. by post, 1s. 8d., from W. H. and L. Collingridge 148, Aldersgate Street, London.

THE STUDLEY HORTICULTURAL COLLEGE.

A scheme, having for its object the training of women to teach and practise the lighter branches of agriculture, viz., horticulture, market gardening, fruit growing and preserving, dairy work, poultry farming, beekeeping, and the marketing of produce, was established by the Countess of Warwick in 1898. A house was taken at Reading in September of that year, where the work was carried on till September, 1903, when the school was removed to Studley Castle, in the county of Warwick.

Studley Castle, which was acquired for the purpose of the college in 1903, consists of a mansion and about 340 acres of land, of which about 24 acres is laid out as gardens and pleasure grounds. It is situate about two miles from Studley, a village with a station on the Midland Railway, between Evesham (the great Midland fruit-growing district) and Birmingham, and is distant from Birmingham about thirteen miles, and Stratford eleven miles.

The buildings consist of the mansion, containing accommodation for 51 resident students, the warden, and a portion of the resident staff (accommodation for the remainder of the resident staff being provided in a house on the premises), and the servants. The main building contains a large dining hall, drawing or recreation-room, two lecture halls, class-rooms, warden's and staff rooms, offices, etc.

There are in the grounds close to the castle a fully-equipped laboratory, a dairy with all modern machinery and appliances, a cheese factory and storage, a marmalade and jam factory, poultry manager's office, rearing, feeding, and trussing houses and sheds, a carpenter's shop, stabling, coach-house, and a bicycle house to accommodate fifty to sixty bicycles. There is a large walled-in fruit and vegetable garden, large orchards, ranges of greenhouses containing 12,200 square yards of glass, rose gardens, ornamental flower gardens and ferneries, potting sheds, tool houses, fruit stores, students' gardens, and a large vegetable garden, and gardener's residence. In the grounds there is an apiary and a pheasantry. In the park are two large lakes affording boating, a hockey ground of two acres, cricket pitch, and tennis courts. The grounds are studded with fine forest and ornamental trees, including many rare and valuable specimens.

There is also a farmhouse, with some farm buildings. Before the college was removed to Studley the mansion was thoroughly overhauled and redecorated. An entirely new system of drainage was installed, and the water was laid on from the mains of the East Worcestershire Water Company. The castle and other buildings are lighted by electric light, which is supplied from a plant on the premises, the plant and wiring having been recently entirely overhauled and a new engine added, which is also used for sawing wood, pumping water, and working machinery in the dairy.

It will be gathered from this that there are splendid opportunities at Studley Castle for obtaining an excellent training in horticulture and allied pursuits. The course of instruction includes: (a) Horticulture and beekeeping; (b) Dairy and poultry work and beekeeping. The full course takes two years. The working year is of forty weeks' duration, and consists of three terms, of about thirteen weeks each, beginning, respectively, in September, January, and May.

Short courses of instruction, lasting from six to ten weeks, are also given at the college.

The college grants diplomas and certificates to those students who have completed their training and passed the necessary examinations.

Students are prepared for the examinations of: (a) The Royal Horticultural Society; (b) The Royal Agricultural Society N.D.D.; (c) The British Dairy Farmers' Association; (d) The Studley College Certificate and Diploma in Dairying; (e) The special examinations in poultry work held at the college each year in July; (f) The first, second, and third class experts' examination of the British Beekeepers' Association. They are also instructed in fruit bottling and preserving, marmalade making, marketing produce, business training, manual training, and woodwork, and the principles of co-operation.

The students pay fees ranging from £80 to £120 a year, according to the bedroom accommodation required, those at £80 sleeping in cubicles, and those who are prepared to pay from £100 to £120 a year having study bedrooms. The sleeping accommodation is the only difference made between students. The fees are inclusive of board, lodging, and tuition, except some few extras, such as instruction in beekeeping, carpentry, and cooking, and also for laundry, and for fires in bedrooms if they are required.

There are also a few Bursary students paying £60 a year.

Up to the present the college has not farmed any of its land (outside the gardens, etc.), but the farm has been let to a tenant.

The students have been in the habit of attending at the farm for instruction in milking, and have also received some instruction in general agriculture by lectures and demonstrations.

STUDLEY COLLEGE—STUDENTS PACKING CHRYSANTHEMUM BLOOMS.

JOTTINGS: CRITICAL AND OTHERWISE.

I have just finished reading Mr. J. B. Riding's paper on "Methods of Exhibiting Dahlias," and I beg to propose a vote of thanks to him for the same, in the first place, for the originality of the text, and, secondly, for the boldness of his suggestions. Perhaps Mr. Riding is living just a little bit before his time, and the idea of making a bonfire of show boards and boxes that are such an essential part of the paraphernalia of every dahlia grower will not be received with approbation in every quarter. Old customs die hard; there is an unwritten law that dahlias shall be exhibited squat-like on ugly boards, and that law can only be altered by being attacked in the outspoken manner adopted by Mr. Riding. I hope that his arguments will not be accepted as the vapourings of a crank, because it is the way of the world to treat everybody as a crank who suggests drastic reforms, but when the reforms have come about people wonder why on earth they were not adopted before.

It is a curious coincidence that only the other day, I met, and had a long chat with, an old florist who grew and exhibited dahlias in the early sixties, when the show and fancy varieties were in the zenith of their popularity. A light of enthusiasm shone in his eyes as he recalled the names of the exhibitors of those days, few of whom now remain, and described the different varieties which were pitted against each other on the show board. It was no good me singing the praises of the modern dahlias, the cactus, pompon cactus, pæony-flowered, and the rest, they might be all very well, but the old man knew them not, except in a general way, and could talk of none but the old varieties of the show and fancy types. Methods and tastes have changed in passing years, but there was an enthusiasm about the florists of old which has never been surpassed, and the veteran referred to, who feels now that he is quite out of it, still has a loving regard for the flowers he grew, and finds pleasure in recalling his victories and fighting his exhibition battles over again.

The development of the sweet pea has probably done more than anything towards effecting an improvement in the methods of exhibiting flowers. Fortunately for this popular flower, it never would lend itself to being dumped down on a flat show board, or it would probably have had to suffer this ill-usage, but it must also be remembered that the sweet pea came to the front in exhibitions at a time when there was an obvious desire to have done with the show board. Even at village shows one sees honest attempts made at exhibiting sweet peas in a tasteful manner, even though the receptacles at the command of the cottager are not always the best for the purpose, and what is done for sweet peas could also be done with other things. But in the majority of village shows attempts at tasteful arrangement can be said to begin and end with sweet peas, and the way in which dahlias, roses, pansies, zinnias, asters, stocks, marigolds, etc., are displayed on the show table reflects no credit on either the management or the exhibitors.

STUDLEY COLLEGE—GRAPE THINNING BY STUDENTS.

I have often wondered why competitions of skill in manual processes should not be encouraged more by horticultural societies than is the case at present. We have local agricultural societies all over the country holding competitions in ploughing, hedging and ditching, thatching, etc., but in horticulture competitions of this kind are almost unknown. Not quite, however, for a short time ago the Newport (Mon.) Society held a competition for pruning, open to young gardeners, and the other day I noticed that a Kentish Cottage Gardening Society had a digging competition among its members. This struck me as being a capital idea, for though everybody agrees how very important good digging is, there are a good many people calling themselves gardeners who are by no means expert in the use of the spade. A competition in this process serves a double purpose, for it gives opportunities for men to pit their skill against each other, and spectators may learn by example. Perhaps if digging had not been such a commonplace task the idea would have been thought of before.

At the moment of writing a big conference of teachers is going on at Plymouth, and members of the profession are gathered together there for the purpose of discussing matters connected with their calling. It is not for me to say the amount of good that is the outcome of these annual conferences, but the vigour of the N.U.T. is a matter of common knowledge, and where teachers tread may not gardeners venture to follow? There is a movement on foot for holding a conference of gardeners in London in July, and gardeners who are in sympathy with the idea are asked to send their names and addresses to the secretary of the British Gardeners' Association, the Executive Council of which will be willing to co-operate, and defray the expenses. It does not seem to be quite clear what the co-operation of the B.G.A. means, but would it not be better for this institution to arrange the conference and invite gardeners to attend it? Perhaps this is what is proposed, and the idea of the invitations is to ascertain the feelings of gardeners in the matter.

Since the National Union of Farmers was formed we have heard more than ever about the desirability of farmers being represented more directly in the House of Commons, and it is not unlikely that members representing the union will be found at Westminster in the future. There is nothing to be said against this, but if agriculture is worthy of direct representation, why not horticulture as well? The different phases of horticulture, including market gardening, nursery work, and commercial fruit growing, all combine to make up an industry of importance, which comes a close second to that of agriculture, and yet one never hears much about horticulture being represented in Parliament. There is some agitation on foot about the desirability of a horticultural department instead of horticultural concerns being under the wing of the Board of Agriculture, but this is hardly likely to come about while horticulture remains unrepresented in the House of Commons, and market gardeners, fruit growers, and nurserymen have nobody to voice their wants in Parliament.

The interesting leader in the issue for March 26th dealing with meetings of gardening societies and lectures in connection with the same, reminds one of the position of many purely local societies in the provinces in regard to these matters. Round about London travelling facilities are easy, and there are plenty of experts who are always ready to help societies by giving their services as lecturers at monthly meetings, but in the country this is not so easy. Many small societies in the provinces are by no means rich in the way of funds, and though they are anxious to make their monthly meetings bright, educational, interesting, and useful, the lecturers available in the locality are limited to a few, and it is not the easiest of matters to introduce novelty and maintain the interest of members. I write this with some knowledge of gardening societies in the provinces, and think it would be a good thing if some kind of union of societies could be formed in different counties, by which they might be of more mutual assistance to each other.

H.

POPPIES IN THE ROCK GARDEN.

Several types and species of the poppy family occasionally find a home in different alpine and rock gardens throughout the country, but none surpass either in beauty or freedom of flowering the dainty Papaver nudicaule and P. alpinus.

The former, which is largely grown for cut flowers and border decoration, is nowhere more delightful than when gemming the nooks and crevices of the rock garden. Self-sown plants appear in the clefts and fissures, enjoying a health and vigour which is often lacking when they are growing in the borders. The cool (if somewhat confined) root run between the rocks seems to suit them to perfection, while the rich green foliage, and the hosts of gay blossoms, bear witness to their adaptability for the rock garden. As is well known, the colouring is delightful, the deep orange, yellow, and white varieties are great favourites, while the newer intermediate shadings extend the range of colourings in a pleasing manner.

As for the dainty little forms of P. alpinus, with their small grey leafage, and the miniature, delicate-petalled flowers, one can fully advocate their merits. Wherever there is a tiny bit of soil, on the ledges, in the crevices, and ofttimes on the scarred face of the boulders, there our tiny alpine poppies will thrive and flourish, sowing themselves freely, and thereby ensuring the future of the race.

Often when P. nudicaule and P. alpinus are grouped in close proximity to each other, it will be found that they hybridise freely, and one can count upon obtaining a selection of intermediate forms as the natural result. Seed of both types may be readily obtained, and the easy germination will more than repay any initial trouble of sowing.

P. S. Hayward.

SOOT.

For those who have gardens on heavy soil, especially if they are in damp positions, a store of soot is a very great convenience, if not a necessity, and, as it is so easy to procure, it should be included among the things to be kept in stock. Its uses are numerous, but they fall naturally into two divisions, as a manure and as a destroyer of or protection against garden pests. We will deal first with its use as a manure.

Ordinary domestic soot contains about three per cent. of nitrogen, chiefly in the form of sulphate of ammonia, and thus, judged by the standard of nitrogen content, seven pounds of it should be equivalent to one pound of sulphate of ammonia, assuming the whole of the nitrogen to be in as valuable a form as that article, which, however, is not the case. It also contains small quantities of potash and phosphates, so that altogether it is a valuable manure. Its use gives a dark green colour to leaves, and heightens the colour of fruit. As a general manure, it should be applied at the rate of a bushel to the hundred square yards, taking care that it is fairly fresh, as loss of nitrogen occurs in storage. Its freshness, or otherwise, can generally be determined by inspection, a loss of that impalpable powdery form being a sign of long storage, rendering it less unpleasant to spread, but at the same time less valuable. Dusting it in the trenches as digging proceeds is a better way of applying it than scattering it on the surface before digging. As a top-dressing it should be dusted on the ground till the latter is quite black and then hoed in.

It has a most beneficial effect upon the texture of the soil, especially upon the surface when hoed in, rendering it light and friable. The crop for which the efficacy of soot is most generally known is that of onions, for which it is undoubtedly very valuable, fulfilling as it does the threefold purpose of manuring the crop, lightening the soil, and warding off to a great extent the attacks of the onion fly. As a liquid manure soot is one of the best, the least objectionable way of using it being to put a peck or so in an old chemical manure bag of loose texture and suspend it in a butt of water for a day or two. It is a useful fertiliser for mixing with potting soil, using it at the rate of a ten-inch pot to a barrow-load of soil.

We must next consider its use as an insecticide in the largest meaning of the term. As everyone knows, it is an excellent remedy for slugs, and when a slug infested soil is top-dressed with soot it serves a double purpose. A ring of soot round a plant is a pretty certain preserver except in wet weather, and even then it prevents slugs hiding in the soil about the crown or stem. After a heavy rain fresh soot may be applied, or the surface of the old dressing lightly stirred if it is still thick enough on the ground. A good way of applying soot for other purposes than as a manure is by means of tins with perforated tops, a supply of which—generally procurable from the domestic side of the house—should always be kept filled and ready for use, so that any plant or plants may have the benefit of it at a moment's notice with the minimum of trouble. Soot should not be carelessly scattered on plants when they are damp as sufficient will adhere to the leaves in that case to scorch them, but when the leaves are dry no damage will result if the leaves are brushed or lightly shaken immediately afterwards.

Celery should always be well sprinkled before being moulded up so as to make the plants unpleasant dwelling places for slugs, worms, etc. Young carrots may often be saved in this way. A good sprinkling of soot in the drills before sowing peas, beans, etc., may keep away a good many enemies, while a sprinkling on the soil over the drills when they have been filled up and raked over will not only keep the seedlings from being attacked as soon as they are up, if the weather is not too wet, but will prevent slugs and grubs of various sorts hiding in the soil among the seedlings.

A dusting of the currant and gooseberry bushes on foggy days in the winter will act as a deterrent to the birds attacking the buds, and later on a similar application will help to ward off the gooseberry sawfly. For the celery fly, too, there is nothing better than keeping the plants lightly dusted with soot, especially in their young stages, and this should be done when the leaves are damp, so that the particles may adhere to the leaves, but not in sufficient quantity to damage them, thus making the leaves distasteful to the fly, which would otherwise deposit its eggs upon them.

Alger Petts.

Seakale.—If the thong cuttings have made good headway in the formation of crowns, as advised, in boxes, they should now be put into permanent quarters in the open ground, providing they have been exposed and well hardened off. The rows should be eighteen inches apart, and a distance of one foot allowed from set to set. Dibble them in firmly, and scatter sifted cinder ashes over them if slugs are troublesome. If lime is lacking in the soil give a good dressing of it.—George Ellwood.

THE GARDENERS' MAGAZINE
. . AT . .
THE IDEAL HOME EXHIBITION,
OLYMPIA, LONDON, April 8 to 23.

OUR READERS and all who visit the Exhibition are invited to call at our Stand—No. 200—in the Gardening Section. All our Books and Publications may be freely inspected.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS.—Many of the species and hybrids growing in the cool house will either be in flower or developing their flower buds. There are no orchids more useful for house decorations, the supply of cut flowers, and for exhibition purposes. There is no section that has been more fashionable, or is likely to remain more popular than the various species and hybrids found among the odontoglossums. Plants that are serviceable for all purposes, as these undoubtedly are, are the most worthy of general cultivation. There are many who are fascinated by the charming tints of the cattleyas and others, and are impressed by the usefulness of the winter-flowering cypripediums and their tractability to cultivation, but giving credit to everything that might be claimed on their behalf, I do not consider them equal to the odontoglossums. In the latter we have plants that are grown under practically greenhouse conditions, and where a house can be devoted to their culture that is capable of holding a few hundreds of plants, we have something in bloom at all seasons of the year. Moreover, the flowers are not only durable, but are the most serviceable of all orchids. I am referring to this point at some length, but recently I have received communications asking for my opinion on the question as to the most serviceable orchids for general cultivation. I must therefore ask to be excused for departing from the usual lines of an orchid calendar. I have in past numbers of the Gardeners' Magazine dealt so fully with the different methods of culture that there is no need for me to refer to them in detail at the present time. I hope, however, to have the opportunity of referring to them at their proper season. It will now suffice to observe that they are among the easiest of subjects to grow, and if they are given the same attention as that necessary in the successful cultivation of other genera, satisfactory results will be obtained.

EXHIBITION SPECIMENS. — Now that the great summer exhibitions are looming in the distance, those who are interested in showing must commence to consider the timing of the plants for particular dates of the shows at which they intend to compete. Those in an advanced state will need retarding by placing them under as cool conditions as may safely be done without injury to their health. Careful shading is necessary. There is nothing that advances growth more rapidly in flower buds than strong light. Moonlight also hastens the growth of flower buds, and it is advisable to shade by night as well as by day, where the plants are too forward. Those in a backward state will require the necessary encouragement. In dealing with cool orchids, accelerating the development of the flowers must be done with discretion, or the result will be a loss of texture, as well as of colour. An important point is to see that the flower spikes are properly and neatly staked before the flowers expand, so that they may be displayed to the best advantage.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

GENERAL.—The occupants of the stove generally will now be making rapid growth, and care must be taken not to allow the plants to become crowded. Many of the younger plants, as soon as hard enough, should be placed on shelves near the glass, putting the crotons, aralias, and pandanus on a shelf where there is plenty of sun; while dracænas, begonias, etc., will be best suited if placed where they have some shade at least during the hottest part of the day.

TABLE PLANTS.—Where neat plants of crotons, dracænas, pandanus, panax, etc., are required in 48's for table plants, either for use at home or for exhibition, they must have special care from the outset, and must be shifted on from 60's before they by any chance become pot-bound, or checked in any other way, and as these are cultivated as near the glass as possible to keep them stocky and of good colour, a sharp look-out must be kept for red-spider, as this is especially troublesome on plants kept on shelves. It is a good plan to have them taken down at least once a week, and thoroughly syringe the upper sides of the leaves, this being the part of the plant most difficult to get at properly when on the shelves. Do not use strong insecticide for this purpose, as the young foliage is easily injured; but a weak solution of paraffin emulsion applied regularly will keep them clean without any damage being done. Plants nicely established in 48's, that may be too tall for the shelves, may be hung here and there from the roof by wires, which may be obtained from any of the horticultural sundriesmen: in this way they keep a good shape and are not likely to be damaged; but bear in mind that, hung in mid-air, they require more water than when on a cool gravel or ash bed.

CALADIUMS.—These, if potted, as advised, early in March, will be growing very freely, and those that were not put straight into large pots right away should be potted on forthwith, as they must not have a check now. Spread the plants out as they require it, giving each room to develop its leaves properly, as if once the leaf stalk becomes attenuated all the beauty is gone and the leaves begin to flop about. Shade when really necessary, but do not overdo this, as by keeping them fairly hard a little later in the season they make beautiful specimen plants for putting in the house just for the week-end, or even longer if necessary.

BEGONIA GLOIRE DE LORRAINE.—Further batches of cuttings should be put in as required, and the earliest batch should be potted off into 60's as soon as well rooted, using a very light compost for the purpose. Keep the sprayer going to prevent flagging, and as they make roots do not stint the water supply, particularly if it is found that the soil keeps sweet.

SEEDLINGS of asparagus, smilax, Clerodendron fallax, torenias, etc., must be potted off into thumb pots as soon as large enough to handle, and before they become crowded in the seed pans; these also must be kept sprayed, and have a little shade for a time, after which most of them will do with less shade and a rather lower temperature; in fact, many of these seedling plants will do well from now onward if grown in a well-heated pit, and just now shelves, etc., in the stove are pretty well crowded, and one is glad to shift a few things as the opportunity occurs to make room for others that really require a very high temperature.

POINSETTIAS AND EUPHORBIAS.—If good sized early plants are required, it will be as well to partially cut down some of the old stock plants and place them in a moderately warm house. Keep these well syringed, but do not give any water at the roots for a few days—at least, not until the eyes begin to plump up and show signs of breaking; then they should be watered, but I do not like to give much, or one is apt to get long-jointed cuttings which are very sappy, and not nearly so easy to strike as are the sturdier ones. Keep the syringe going well amongst all the plants on all favourable occasions, not forgetting a good damping of the floors and stages of the houses during the evening, at least when the temperature outside warrants it.—T. Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

YOUNG VINES that have been cut back and newly planted, and others that have not yet reached their full length, should each have the leading growth carefully trained as it lengthens, and stopped (in order to strengthen it) when it has reached four feet in length. Subsequently train the leading growth from each vine to the top of the trellis, and stop sublaterals at one leaf. With respect to atmospheric moisture, temperature and other cultural details, the ordinary treatment recommended for fruit-bearing vines during their early stages of growth will suffice. The leaves should be kept clean by being carefully syringed.

LATE VINERIES. — Vines started in houses of this description in a natural kind of way, as previously advised, should not be hastened by artificial warmth during their early stages of growth; 50 to 55 deg. at night should not be exceeded, and in sunny weather the valves of the hot-water pipes should be closed during the greater part of the day. At such times slightly ventilate the house early, increase the ventilation carefully as the sun gains power, and close the house early in the afternoon with a temperature of 80 deg. Insure a moist atmosphere by damping suitable surfaces several times daily, and, should the border require water, which can be ascertained without doubt by means of Kirk's border tester, give an efficient supply of tepid water. Commence to disbud the vines by rubbing out the weak growths as soon as they can be distinguished, and on completing this work leave upon each spur its best shoot.

CHERRIES.—As soon as the fruit is set syringe the trees in the morning of bright days, and again as soon as the house is closed. Careful attention must be paid to watering, especially to trees in pots, and occasionally give manurial assistance in a weak form. The cherry is very impatient of high temperature promoted by fire heat, and until its fruits have formed stones the artificial temperature should not exceed 45 deg. at night and 50 deg. by day. Open the ventilators a little when this degree is reached, and when necessary increase the ventilation to prevent a high temperature being attained from sun-heat. Disbud undesirable growths, stop others to form fruit-bearing spurs, and, where necessary, allow others to extend to improve the tree.

MELONS.—Plants either growing in pots, or planted out, and that are swelling their fruit should have their sublaterals persistently stopped at one leaf, and be kept carefully nourished with timely supplies of diluted liquid manure, or light top-dressings of suitable artificial compounds. At no time allow them to suffer from want of root moisture. Keep the leaves clean and free from red-spider by syringing the plants early in the morning, and again at the time the house is closed on fine days. Maintain a night temperature of 70 deg. As soon as the fruit commences to ripen, discontinue syringing, and diminish in every other way the supplies of moisture; keep up as outside circumstances dictate, a circulation of air through the house. Successional crops when in blossom should have tolerably dry and warm airy atmospheric surroundings; pay daily attention to pollination, and stop the laterals at one leaf beyond the fruit.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

MAINCROP POTATOES.—It will now be time to take this important crop in hand. If the plots were treated as previously advised, and the surface freely stirred, there need be little delay in planting the sets. The potatoes should be properly sprouted, with two or three strong, sturdy shoots. Drills should be drawn four to five inches deep, and the sets placed in them twelve to fifteen inches apart, according to the variety; cover very carefully to avoid damaging the young shoots. Decayed leaf-soil can be used to advantage, scattering a little along each drill. The drills should be from two feet to two feet six inches apart, according to the haulm of the variety. To procure good exhibition specimens, take out a trench six inches deep and fill with three parts loam, two parts leaf-mould, and one part finely sifted burnt garden refuse; plant the sets as advised, and finish off by drawing the old soil over the whole of the prepared compost. Snowdrop, Windsor Castle, Superlative, and Up-to-Date are first-rate for crop and flavour.

WINTER GREENS, BROCCOLI, AND CAULIFLOWERS.—The chief sowing should now be made in an open position, choosing ground that contains no fresh manure. Give a surface dressing of burnt garden refuse, soot, and lime, and well work it in with a fork, bringing the surface into a very fine tilth. Sow thinly broadcast, or in drills nine inches apart. If drills are used, frequent hoeings can be given as soon as the seedlings appear, which to a great measure wards off the dreaded turnip fly, a persistent pest on some soils. Equal parts of lime and sulphur is perhaps the best remedy to apply for this pest. When sowing, choose, with others, well-tried varieties that succeed in one's locality, particularly of broccoli. Do not omit a sowing of leeks for use twelve months hence. Protect the seed bed from birds at the time of sowing.

PARSLEY.—The early batch that was pricked off in boxes and is now hardening off, can forthwith be planted out in rich soil at one foot apart; water in if dry, and place a ring of cinder ashes around each plant as the work proceeds. Occasional dustings of soot are very beneficial to this crop. Make another sowing in the open ground.

CAULIFLOWERS. — Both autumn and spring sown varieties can now be safely planted in any position. It is a great advantage to plant breadths on various aspects to prolong the season. Well water them in, and endeavour to prevent a check of any kind by planting firmly on well manured ground.

ONIONS.—Plants that were raised in heat, pricked off, and hardened in cold frames, should be planted out about the 20th of the present month if the weather conditions are favourable. An open site which has been well prepared previously should have the surface lightly forked over, working in as this proceeds a dressing of soot; when the surface has become nicely dry, tread it firmly, rake down finely, and proceed to plant very carefully fifteen inches apart in rows the same distance apart; water in, and syringe regularly till established.—George Ellwood, Swanmore Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

On Tuesday, April 5, there was once more a large exhibition at the Royal Horticultural Hall, but in a large number of the displays there was little of special interest. Daffodils were well represented, and the new seedlings from Mr. Wilson were particularly pleasing. Orchids were much in evidence, and there were some splendid groups, and also some fine novelties, notably the odontoglossum from Mrs. Cookson. There was a good attendance.

FLORAL COMMITTEE.

Several new and beautiful Ghent and mollis azaleas were submitted by Messrs. Paul and Son, Cheshunt, who also showed the graceful Cytisus Handsworthiensis, Osmanthus Delavayi, and the graceful Lonicera pileata (A.M.), with small greenish flowers and evergreen shining leaves. Dwarf polyantha roses, in pots, formed the bulk of Messrs. H. B. May and Son's exhibit, and they were very well grown. The effective pink-flowered Begonia Saturne was very finely shown by Messrs. H. Cannell and Sons, Swanley, who had several dozen plants, some carrying as many as thirty flower spikes. The same firm had some beautiful zonal pelargoniums.

In Messrs. R. Wallace and Co.'s group from Colchester Primula Mrs. J. H. Wilson was charming, and the fritillarias, aubrietias, and freesias were other good things. The yellow Rhododendron Smithi aurea was a feature of the collection of shrubs and alpines staged by Messrs. W. Cutbush and Son, Highgate; their double and single hepaticas were also delightful. Mr. P. Ladds, Swanley, contributed a group of well-grown and fragrant stocks; Messrs. Bakers, Wolverhampton, brought up hardy primulas and violas.

Roses were delightfully shown by Mr. George Prince, Longworth, who had grand blooms of The Lyon, Fortune's Yellow, White Killarney, Richmond, and Lady Roberts. Acacias, cytisuses, Andromeda speciosa cassinaefolia, Veronica Hulkeana, and standards of Viburnum opulus made up a fine group from Messrs. Jas. Veitch and Sons, Lim., Chelsea. Dracæna atropurpurea, from this firm, was a striking plant. Cinerarias were also finely shown by Messrs. Jas. Veitch and Sons, who had the brilliant, almost scarlet-hued Matador, a great novelty; Antique Rose, the graceful Feltham Beauty (A.M.), in six shades of colour, and a grand lot of fine florist's forms.

Very gorgeous and attractive were the trusses of Himalayan rhododendrons shown by Messrs. R. Gill and Sons, Penryn, Truro; R. barbatum, R. Thompsoni, and numerous seedlings were charming, while Camellia reticulata was splendid.

Some very pretty auriculas were exhibited by Mr. Jas. Douglas, Great Bookham; Phyllis Douglas (A.M.), Moonstone, Dr. Hardy, Martin Smith, and Admiration were all superb varieties. Messrs. Wm. Paul and Son, Waltham Cross, showed a small group of their delightful new, glowing, and fragrant rose, named Juliet—a fine novelty. Messrs. S. Low and Co., Enfield, had a bold exhibit of perpetual carnations, roses, and some fine flowering plants of various acacias.

Perpetual carnations were again finely shown by Messrs. W. Cutbush and Son, Highgate; Mr. C. Engelmann, Saffron Walden; Mr. H. Burnett, Guernsey; and Mr. W. H. Page, Tangley Nurseries, Hampton, the latter showing splendid liliums with the carnations.

Numerous nurserymen showed small groups of hardy flowers. Messrs. T. S. Ware, Feltham, whose hardy primulas were lovely; Messrs. Gilbert and Son, Dyke, who showed anemones; Messrs. G. Jackman and Son, Woking, who had Lithospermum prostratum, primulas, and squills; Messrs. J. Peed and Son, Norwood, who showed primulas and cacti; Mr. C. Elliott, Stevenage, who had a Clarke, Dover, whose polyanthuses and Viola small alpine garden; Messrs. G. and A. Bridal Morn were very attractive; and Messrs. Heath and Son, Cheltenham, who showed alpines.

DAFFODIL COMMITTEE.

A marvellously beautiful group of choice and new seedling daffodils was set up by Mr. Alex. M. Wilson, Shovell, Bridgwater. The large number of varieties were unnamed seedlings of the greatest beauty and refinement. Of those named, Conqueror, Sunflower, Pilgrim, Bedouin, Ibis, Ivorine, Inglescombe (double), Cossack, Victory, and Gadfly were delightful. Mr. F. Lilley, Guernsey, brought over a few daffodils, representing popular varieties. Messrs. Barr and Sons, Covent Garden, showed good Darwin tulips, and a collection of daffodils, in which Jasper, Gadfly, Cœur de Lion, Michael, Lycidas, Homer, and White Slave were conspicuous.

In Messrs. Cartwright and Goodwin's exhibit of daffodils Marigold, Blackwell, Ayacanova, Target, Sailor (the result of crossing Minnie Hume with Stella superba), Northern Light, and Homespun, were a few of the finer varieties. Daffodils, tulips, and squills were prettily grouped by Messrs. R. H. Bath, Lim., Wisbech. Mr. J. Pope, King's Norton, Birmingham, had a few daffodils, the most prominent being King's Norton, Estelle, Lady M. Boscawen, Goldfish, and Torch. Mr. J. A. Cooper brought over a fine group of daffodils from Lissadell, Sligo, and showed good flowers of Sir Watkin, Sir Horace Plunkett, King Alfred, Mrs. R. Sydenham, Incognita, Flambeau, and Mdme. de Graaff.

LYCASTE SKINNERI HELLEMME'S VARIETY.

Flowers rich vinous rose. F.C.C., R.H.S., April 5. Lieut.-Colonel Holford.

Messrs. Jas. Carter and Co., High Holborn, had a delightful grouping of King Alfred daffodil, this fine variety being represented by 450 flowers, grouped among rocks and around a pool of water, with a foreground of grass and a background of deodars; tulips and hyacinths flanked the daffodils.

ORCHID COMMITTEE.

The most wonderful orchid shown was Odontoglossum ardentissimum Norman Cookson (F.C.C.), brilliantly coloured with bright chocolate red on a white ground; this was from Mrs. N. Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne. Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, brought up Phaius Norman, Odontioda Bradshawiæ, and Zygopetalum Wendlandi. Superbly-grown plants of Odontoglossum ardentissimum Westonbirt var., O. Pescatorei Westonbirt var., O. amabile Westonbirt var., Lycaste Skinneri Hellemmes var. (F.C.C.), grandly coloured, and Cattleya Apelles, with three glorious purple flowers, were shown by Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

A very fine group of orchids, staged by Messrs. Armstrong and Brown, Tunbridge Wells, contained a large number of well-grown dendrobiums, notably D. splendidissimum, D. Wiganæ, D. Artemis, D. nobile, and many other good things, finely flowered. These were grouped at either end of a long table, and in the centre of the group was a mound of odontoglossums and cymbidiums, the arching spikes producing a charming effect. In between these groups were cypripediums, lycastes, lælio-cattleyas, and sophronites. Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, exhibited

Odontoglossum Rossi roseum, and a fine specimen of Cirrhopetalum Cumingi.

A large and bold display of orchids from H. S. Goodson, Esq., Putney, staged by his gardener, Mr. G. Day, was greatly admired. Ferns and palms were pleasingly associated with the flowers, and among the most striking plants were Odontoglossum percultum Fairlawn var., O. Ceres Goodson's var. (A.M.), O. Loochristiense, Odontioda Bradshawiæ Goodson's var., O. Goodsoniæ (A.M.), O. Vuylstekeæ, Brasso-cattleya Maroniæ, Cattleya intermedia, Phaius Norman, and numerous cypripediums and dendrobiums, and other odontoglossums than those named.

Messrs. Sander and Sons, St. Albans, had a fine specimen of Vanda casta superbissima (F.C.C.), and excellent examples of Cattleya citrina, C. Schroderæ The Dawn, Odontioda Cooksoniæ sanguinea, and several oncidiums, odontoglossums, phalænopsis, and masdevallias.

The yellow Dendrobium Thwaitesiæ was remarkably well shown by Mr. Balmforth, gardener to F. Menteith Ogilvie, Esq., The Shrubbery, Oxford, but the group would have been much improved had a few ferns been placed under the plants.

Mr. E. V. Low, Haywards Heath, showed a fine set of Dendrobium nobile virginale, D. rubens grandiflora, Cattleya Luddemanniana Stanleyi, Brasso-cattleya Digbyano-Schroderæ, and a fine white form of the fragrant Cattleya Schroderæ. Mr. A. W. Jensen, Haywards Heath, had some fine odontoglossums and cattleyas. Dendrobium crassinode figured largely in the group of orchids shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield: other good things were D. Jamesianum, Lælio-cattleya Golden Crest, and various odontoglossums. Messrs. Charlesworth and Co., Haywards Heath, presented some fine odontoglossums, Odontioda Bradshawiæ, Zygopetalum Perrenondi, Souhro-cat-lælia Hon. Mrs. Barbara Wilson (A.M.), Lycaste Skinneri alba, and Lycaste gigantea, etc.

FRUIT AND VEGETABLE COMMITTEE.

Some fine cabbage lettuces, from seed sown on January 12 last, and grown in a cold frame, were contributed by Mr. C. Harris, gardener to the Earl of Clarendon, The Grove, Watford; and Mr. C. Foster, Guildford, showed excellent chicory. Messrs. Sutton and Sons, Reading, exhibited a number of small succulent cabbages, the varieties being Sutton's April, and Harbinger, both of which were excellent.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Odontoglossum ardentissimum var. Norman Cookson, from Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne; to Lycaste Skinneri Hellemme's var., from Lieut.-Colonel Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury; and to Phalænopsis casta superbissima, from Messrs. Sander and Sons, St. Albans.

Award of Merit.—To Odontoglossum Ceres Goodson's var., from H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney; to Odontioda Goodsoniæ, from H. S. Goodson, Esq.; to Sophro-lælio-cattleya Hon. Barbara Wilson, from Messrs. Charlesworth and Co., Haywards Heath; to Auricula Phyllis Douglas, from Mr. Jas. Douglas, Great Bookham; to Cineraria Feltham Beauty, from Messrs. Jas. Veitch and Sons, Lim., Chelsea; and to Lonicera pileata, from Messrs. Paul and Son, Cheshunt.

MEDALS.

Gold.—To Mr. Alex. M. Wilson, Shovell, Bridgwater, for seedling daffodils; to H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney, for orchids.

Silver-Gilt Flora.—To Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Jas. Veitch and Sons, Lim., Chelsea, for cinerarias and shrubs.

Silver-Gilt Banksian.—To Messrs. W. Cutbush and Son, Highgate, for carnations, etc.; to Mr. G. Prince, Longworth, Berks, for roses; and to Mr. L. R. Russell, Richmond, for flowering shrubs.

Silver Flora.—To Mr. H. Burnett, Guernsey, for carnations; to Messrs. Stuart Low and Co., Enfield, for carnations, acacias, etc.; to Messrs. H. B. May and Sons, Edmonton, for roses; to Mr. W. H. Page, Hampton, for lilies and carnations; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; to Mr. J. A. Cooper, Lissadell Bulb Farm, Sligo, for daffodils; to Messrs. Barr and Sons, Covent Garden, for daffodils and tulips.

Silver Banksian.—To Messrs. J. Carter and Co., High Holborn, for daffodils; to Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. H. Cannell and Sons, Swanley, for begonias and pelargoniums; to Messrs. R. Gill and Son, Penryn, Falmouth, for rhododendrons; to Messrs. G. Mount and Sons, Canterbury, for roses; to Mr. G. Reuthe, Keston, for hardy plants; to Messrs. R. Wallace and Co., Colchester, for hardy flowers; and to Mr. C. Engelmann, Saffron Walden, for carnations.

Bronze Banksian.—To Messrs. R. H. Bath, Lim., Wisbech, for daffodils and tulips; and to Mr. F. Lilley, Guernsey, for daffodils.

SCIENTIFIC COMMITTEE, March 22.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S., Sir George Watt, Sir John Llewelyn, Messrs. A. Worsley, F. du Cane Godman, R. Hooper Pearson, W. Cuthbertson, J. Fraser, W. Hales, J. W. Odell, J. T. Bennett Poë, H. J. Elwes, J. Douglas, F. J. Baker, E. M. Holmes, Dr. Voelcker, and F. J. Chittenden (hon. secretary).

ALGÆ IN WATER TROUGH.—Dr. Voelcker reported that the alga which he showed at the last meeting had been identified at Kew as Phormedium laminosum, and that treatment with copper sulphate at the rate of one part to 5,000,000 of water had proved effective in killing it.

DOUBLE-SPATHED RICHARDIA.—From Dr. Biggar, of Streatham Common, came a very vigorous plant of Richardia æthiopica, with a double, instead of a single, spathe.

CYCLAMEN LATIFOLIUM.—Mr. A. W. Sutton, V.M.H., sent two plants of Cyclamen latifolium for comparison with others recently shown, grown from corms collected by him in Palestine. He remarked that young corms were very difficult to obtain, because they are almost always deeply embedded in the crevices of the rocks, and it is only the large and overgrown roots that one is able to get without much trouble, and the result is that the flowers then are not so large as they would be on younger plants. The majority of the cyclamen he had seen in Syria are white with red base, but he had also seen self-coloured reds of various shades and often considerably larger than those shown.

BRANCHING OF MID-RIBS.—Mr. E. A. Bowles showed, on behalf of Canon Ellacombe, a leaf of Carpenteria californica having the mid-rib forking at about one-third from the base. He also showed a flower of Iris reticulata from his own garden exhibiting a similar phenomenon.

PRIMULA MAXIMOWICZII.—Messrs. J. Veitch and Sons sent Primula Maximowiczii, which had been obtained from W. China at an altitude of 9,000 feet, and was now seen for the first time in cultivation. It belongs to the section Nivales. The elliptic, oblong leaves, with small teeth along their edges, are about two to three inches long, quite glabrous and without farina, and form a rosette. The scape, about ten inches tall, bears many flowers, arranged verticillately as in P. japonica, having long, narrow, triangular bracts. The calyx is campanulate and about half the length of the corolla tube. The corolla is dark, clear purple, and has the lobes reflexed. On the motion of Sir J. Llewelyn, seconded by Mr. J. Douglas, a botanical certificate was unanimously recommended for the plant.

MONŒCIOUS SALIX.—Mr. E. A. Bowles showed branches of Salix cinerea from Myddleton House, Waltham Cross, bearing both male and female catkins. Mr. Fraser said the pistils appeared to be metamorphosed stamens. He had met with a somewhat similar thing before in S. aurita, and the plant had produced similar variations in several successive years. He took some specimens for further examination.

SEEDLING VIOLAS.—A number of flowers of a seedling of Viola hirta from Devon, sent by W. P. Stark, Esq., of Hillstead, Basingstoke, were shown. Their appearance suggested the probability of their being hybrids with one of the garden forms.

PRITZEL'S INDEX ICONUM BOTANICARUM.—Mr. H. J. Elwes brought forward the question of the republication with amplification of Pritzel's "Index Completissimum Iconum Botanicarum," which had been referred to in the annual report of the council. He suggested that it was a matter that the society might itself undertake with great benefit to horticulture, and a resolution embodying that idea was sent from the committee to the council.

International Horticultural Exhibition, 1912.

The lecture room at the Royal Horticultural Hall was well filled when the chair was taken at the public meeting, which was held on Tuesday afternoon, for the purpose of considering the advisability of holding an International Horticultural Exhibition in London two years hence. The meeting was perhaps a little less enthusiastic than might have been expected by those of a sanguine temperament, but there was a remarkable unanimity throughout the proceedings, and there is full justification for anticipating that the project will be brought to a successful conclusion. Sir Trevor Lawrence, Bart., president of the Royal Horticultural Society, occupied the chair, and he was supported by Sir Albert Rollit, Mr. Gurney Fowler, Mr. H. J. Veitch, V.M.H., Mr. J. Hudson, V.M.H., Rev. W. Wilks, Mr. H. B. May, and Lieut.-Colonel Holford. Among the members of the trade present in the room we noticed Mr. Leonard Sutton, Mr. G. Bunyard, V.M.H., Mr. A. W. Paul, Mr. G. Paul, V.M.H., Mr. E. Laxton, and Mr. J. Green.

The Chairman, in opening the proceedings, said the public meeting had been called for the purpose of considering the desirability of holding an international horticultural exhibition in 1912, with the object of showing the immense advance that had been made in all that relates to horticulture, and to return in some measure the hospitality that had been shown British horticulturists by the great horticultural organisations on the Continent. During the forty-four years that had elapsed since the great international exhibition at South Kensington was held, the centres of horticultural activity in France, Germany, Belgium, and Italy had held international gatherings and British horticulturists had been invited to participate in the pleasure associated with them, and had received the warmest welcome, and at some of the centres this had not been limited to one occasion, but had been repeated several times. It should be remembered that there had been an immense increase in the love for horticulture during this long period, and the improvement in methods of procedure had been not less remarkable. It should also be borne in mind that the spread of a taste for gardening and the work of improvement had not been confined to this country. We had fully maintained the position in gardening matters that we have so long occupied, but other countries had also made great advances. There could be no question that the time had come when we should hold an exhibition of an international character, and it was equally certain that the time was eminently favourable to the work of organising the exhibition with the full assurance of successful results.

The international exhibition held in 1866 was described by the gardening papers as a magnificent success, and the dinner held at the Guildhall in association with it was not less successful. Under the original arrangements the show was to have been limited to three or four days; but it was subsequently decided to extend it by an additional three or four days, and during this extension there were between 70,000 and 80,000 visitors. With a love of gardening extending in all directions, and the prodigious strides being made there appeared no good reason why the success of the exhibition in 1912 should not far surpass that of 1866. The first step would be to obtain the co-operation of those who are known to be taking a keen interest in gardening. It was proposed to form a large general committee, comprising noblemen, gentlemen, and ladies, specially interested in horticulture, members of the nursery and seed trade, and others engaged in horticultural activities.

The question of finance was one that would require careful consideration. Broadly speaking, the receipts of the exhibition held in 1866 were £16,000, and the expenditure £12,500. The surplus was therefore £3,500, and of this amount the sum of £1,000 was contributed to the Gardeners' Royal Benevolent Institution, and the remainder was paid to the Royal Horticultural Society. In view of the large expenditure necessary in carrying out an exhibition of an international character, it was advisable that a guarantee fund should be formed. The Royal Horticultural Society would make a liberal contribution to such fund, and he did not anticipate that the guarantors would be called upon to pay. He fully believed that whatever the prosperity of the exhibition in 1866 that of 1912 would be more pleasant and profitable. The Royal Horticultural Society would do all it possibly could to assist in making the exhibition successful, but it was considered advisable that the arrangements should be carried out by a specially appointed committee. Sir Trevor Lawrence then moved a resolution to the effect that this public meeting is of the opinion that an international horticultural exhibition should be held in 1912.

Sir Albert Rollit, in briefly seconding the resolution, expressed the opinion that such an exhibition would have a good commercial effect, and be of advantage in other respects, inasmuch as it would help to break down the barriers that stand in the way of friendship between nations. The resolution on being put to the meeting, was carried unanimously.

Sir Trevor Lawrence next proposed that the gentlemen and ladies whose names had been read should be invited to act on the general committee, with power to add to their number. This resolution was seconded by Mr. Gurney Fowler, and carried. The proposition that Mr. E. White be invited to provisionally act as secretary was also unanimously accepted. Mr. H. J. Veitch, in proposing a vote of thanks to Sir Trevor Lawrence for presiding, mentioned that he was the only survivor of the executive of the 1866 exhibition, and said that the proposed exhibition would have his heartiest support.

Bristol Gardeners' Association.

The annual official visit of the Bristol amateur gardeners was paid to the above society on March 24. The meeting was held at St. John's Parish Rooms, and was presided over by the president, Colonel Carey Batten; there was a large attendance. Mr. White gave a paper entitled "An Amateur's Orchid Notes." Mr. White referred to the good feeling existing between the two societies and hoped it would continue. In speaking of the attractiveness of flowers, the lecturer said there was no class of plants to be compared with orchids, especially when taking into consideration their lasting qualities and cheapness. Cattleyas, odontoglossums, oncidiums, dendrobiums, and cœlogynes, were recommended for a small collection, while the cypripediums were much the best for a town. Colonel Carey Batten opened the discussion, and at the close votes of thanks were accorded to lecturer and chairman, and Mrs. Carey Batten.

The latter replied, and was received most enthusiastically.

For two cinerarias Messrs. Shelton, Young, and Candy won in the order given. Messrs. Gostling and Woodward received two points each, the former for an odontoglossum, the latter for a dish of Sutton's Forcing bean.

Reading Gardeners' Association.

At the fortnightly meeting held in the Abbey Hall on Monday, April 4, there was, notwithstanding unfavourable weather, a good attendance of members. Mr. T. Judd presided.

The subject for the evening was "Rhododenrons," introduced by Mr. A. F. Bailey, The Gardens, Leopold House, Reading. In a brief, but most practical, paper Mr. Bailey dealt with these, the most magnificent of flowering shrubs, in their various stages from seedlings to fully-matured plants, giving much instructive information on the treatment of both hardy and tender varieties, also on planting for effect, colour combinations, massing, etc.

In the discussion which followed the paper Mr. Bailey was at his best, and his practical demonstrations on the grafting, layering, packing, etc., of rhododendrons were eagerly followed by an appreciative audience, and a hearty vote of thanks was accorded him at the close of the meeting.

At the next meeting, to be held on April 18, Mr. T. J. Powell, of Park Place Gardens, will give one of his well-known demonstrations, "The Arrangement of Cut Flowers in Vases, etc." On this occasion ladies will be admitted, and members are invited to bring bunches of flowers, which will afterwards be sent to the Royal Berkshire Hospital. A collection on behalf of the funds of this noble institution will be made, as usual, in the hall.

THE IDEAL HOME EXHIBITION.

Yesterday (April 8) was opened at the Olympia, Kensington, an exhibition which has for its object the practical demonstration of the views which obtain among builders, manufacturers, furniture dealers, and others on the all-important question of the "Ideal Home." The exhibition is extensive, varied, and attractive, and will be found of much interest by those who devote any considerable share of attention to the home and its surroundings. It will be readily conceded that a home without a garden would be far from approaching the ideal; and it therefore follows that chief among the more interesting of the contributions to the exhibition are those associated with the garden in its relation to the house. To those of our readers who visit the exhibition the gardening features will be of quite exceptional interest, and we are fully assured that they will not like to miss the Gardeners' Magazine Stand, No. 200, where they will be heartily welcomed, and find much that is interesting and instructive. The central feature of "Our Stand" is a garden pavilion or shelter. On the walls are displayed many of the beautiful illustrations of gardens that have appeared in these pages, and, by reason of their suggestiveness, proved of great educational value. There are also many coloured plates, illustrative of noteworthy plants and flowers, and attractive garden scenes, and copies of all the books issued from this office. The books should prove of much interest to those engaged in horticultural activities, for they are now so numerous as to form an excellent garden library, which our readers can depend upon for practical information.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CANARY GUANO.
"The Best in the World."

There is no fertilizer quite like Canary Guano. It is used in the King's gardens, is perfectly clean, and has no unpleasant odour. Improves and renovates lawns; does not mould on the surface of pots. Unsurpassed for use for Exhibition purposes.

Sold in tins, **6d.**, **1/-**, and **2/6** each; Bags—14 lb., **3/6**; 28 lb., **6/-**; 56 lb., **11/-**; 1 cwt., **20/-** each, by all Seedsmen, or direct from the Manufacturers,

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to **send early notification of forthcoming exhibitions** and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. **All parcels must be sufficiently prepaid.**

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending **early intimation of interesting local events relating** to horticulture. In sending newspapers containing **matter to which they wish to draw attention,** correspondents are requested to distinctly mark the **paragraph.**

BUDDLEIA MADAGASCARIENSIS. — P. S. O., Ross: Buddleia madagascariensis is, as its name implies, a native of Madagascar, and it has long been in cultivation, though its merits have not been sufficient to bring it into popularity. Seeds were sent to this country from Calcutta by Dr. Wallich, long ago, and the resulting plants flowered at Kew, Edinburgh, and Glasgow in the autumn of 1827. Through whom Dr. Wallich received seeds does not appear, but it is on record that Sonnerat first found it in Madagascar, and named it Vigne de Malgache. The species is of little horticultural value, and suffers by comparison with B. variabilis and B. asiatica, while, like these latter, it has a compound raceme of flowers, and not a rounded head of bloom as in B. globosa. The colour of B. madagascariensis is reddish or orange. The accompanying illustration shows the style of inflorescence. B. madagascariensis requires a warm greenhouse or cool stove temperature.

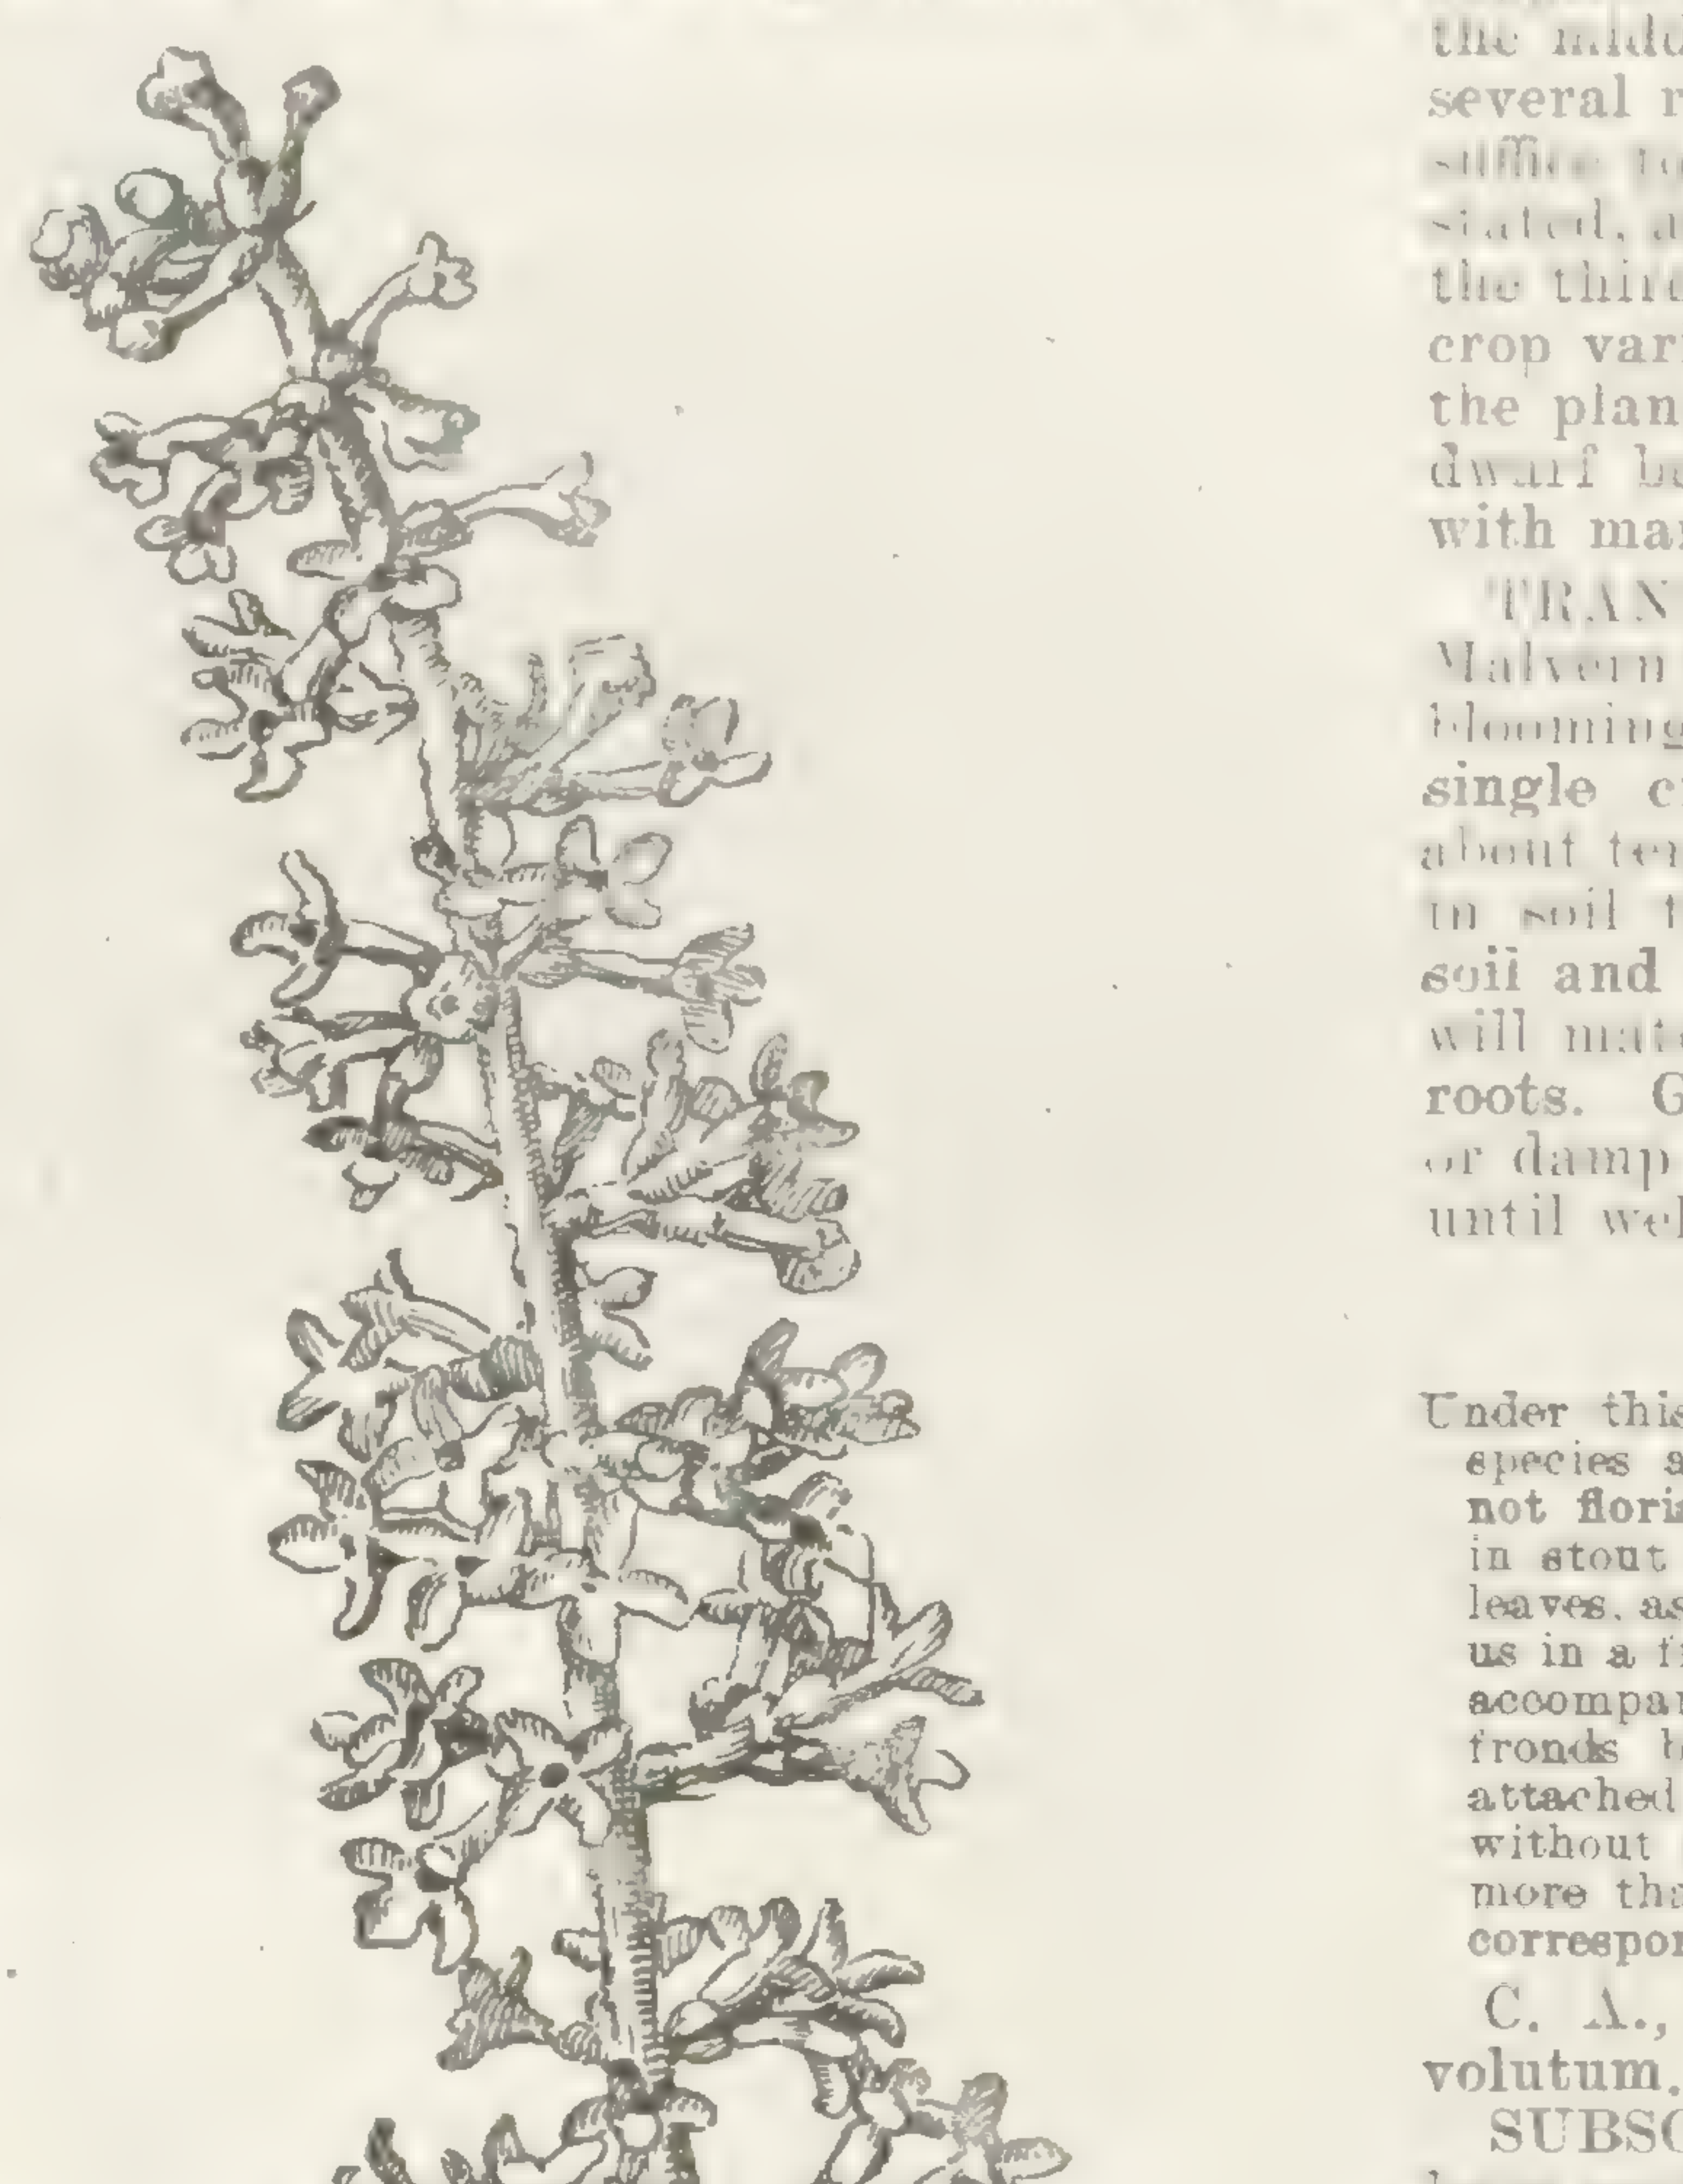
BLUMENBACHIA CORONATA.—N.T.W., Dorking: This is a biennial species of a South American genus of herbaceous plants. It is not altogether hardy but, no doubt, it would be cultivated were it not for the stinging hairs that render all the members of the genus more or less objectionable under cultivation. It has white flowers, two inches across, but these are not so effective as they would be were they raised well above the foliage. The plant grows about 1½ft. high, and was introduced in 1872. The annual B. insignis is a hardy trailing plant with whitish flowers, while B. chaquitensis is a half-hardy perennial climber with red flowers. The blumenbachias are closely allied to the loasas.

WITCHES' BROOMS.—S.S., Woking: The dense tufts of small branches that form the popular "Witches' Brooms" or "Birds' Nests" in the silver birch, are due to the presence of a fungus named Exoascus turgidus. Very similar species sometimes attack the cherry, and the female catkins of the alder. Some people rather pride themselves upon having one or more specimens of the silver birch with a large number of these "Witches' Brooms" in their garden, but it is a dangerous proceeding to allow these developments to remain if there are clean trees in neighbouring gardens. The branches on which these curiously-deformed clusters of branches appear should be cut well back and burned, as the mycelium of the fungus is perennial in and round the affected part, and may extend.

REIDIA GLAUCESCENS. — L. L. G., Hastings: This is more correctly Phyllanthus glaucescens. It makes an elegant, interesting, and useful table plant, and succeeds under the same treatment as Aralia Veitchi and A. elegantissima.

STRAWBERRIES.—R. E. J., Prescot: At the first convenient occasion proceed to clean the strawberry beds, removing weeds and decayed leaves. Give a good dressing of soot, and hoe this in. Then put down a good layer of long stable litter between the rows and the plants, making this as tidy as possible. The rains will wash the litter clean, and the straw will prevent the fruits from becoming splashed with dirt. Have some dry hay or bracken kept handy, so that when the strawberries begin to bloom a little of this material may be lightly shaken over the plants, if frost is imminent, to protect the flowers, and thus save the early part of the crop.

SORREL.—S. M., Cromer: The best sorrel for cultivation is the Broad-leaved French variety, and it is easily raised from seeds sown thinly in deep, rich soil, in drills about a foot apart. Thin out the seedlings to eight or nine inches apart. The plant is perennial, and may be increased by division in the spring. When the crop is fit for use pick the fully-developed leaves singly, instead of cutting down several plants with a sharp knife.



BUDDLEIA MADAGASCARIENSIS.

DWARF BEANS.—E. S., Bletchingley: It is a good plan to raise some dwarf beans in boxes under glass, and plant these out at the end of May or early in June, but failing this method, a commencement should be made out of doors as early as possible, as the earliest supplies are extremely useful, and very highly appreciated. The first sowing should be made at the end of April, or the beginning of May, and if the young plants make their appearance above the surface before all danger from frost is past, they must receive protection when frost is expected. This may be given by means of small sprays of spruce, fir, or evergreens, or even by pieces of newspaper laid over the rows, and so secured as to prevent their being blown away. A warm sunny border should be set apart for the first sowing. The rows should be eighteen inches apart, and the plants be six inches apart in the rows. For the maincrop sow a good breadth in an open quarter about the second week of May, and for successional supplies sow at intervals of three weeks until the middle of July. In small gardens where several rows of runners are provided, it will suffice to make four sowings, two as already stated, and one at the end of May, and one in the third week of July. The rows for maincrop varieties should be two feet apart, and the plants be six inches apart. The soil for dwarf beans should be moderately enriched with manure, and be deeply stirred.

TRANSPLANTING VIOLETS. — F. D., Malvern: When the plants have finished blooming lift and carefully divide them into single crowns. Plant these single crowns about ten inches apart in a semi-shaded place, in soil that is in good condition. Old leaf soil and wood ashes forked into the surface will materially assist the plants to form new roots. Give water as necessary, and syringe or damp the plants overhead in fine weather until well established.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and **not florists' flowers.** Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one **correspondent.**

C. A., Moreton.—Probably Jasminum revolutum.

SUBSCRIBER.—The tree of which you have sent specimens is Eucalyptus cordata.

NEW SNOWDROP.—T. J. N., Aylesford: Take every care of the plants, and endeavour to work up a little stock of bulbs. We should like to see a flower early next spring.

O., Sheffield.—1, Dendrobium superbum; 2, Cypripedium barbatum; 3, Oncidium sphacelatum; 4, Lonicera sempervirens; 5, Cypripedium villosum; 6, Pulmonaria officinalis.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

National Auricula and Primula Society (Midland Section), May 4 and 5, at Birmingham Botanical Gardens.

Elstree and Boreham Wood Horticultural Society.—July 13 at Aldenham Park, and September 17 at Elstree.

Huntingdon Spring Flower Society.—April 20, in the Corn Exchange.

Oxfordshire Horticultural Society.—June 2, Trinity College Gardens, Oxford.

Oxfordshire Chrysanthemum Society.—November 8, in the Town Hall, Oxford.

Southampton Horticultural Society.—Rose Show, July 5 and 6, at the County Cricket Ground; Carnation Show, July 27, on the Royal Pier; Chrysanthemum Show, November 8 and 9, place yet to be fixed.

TRADE NOTE.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, have sent us a very pretty and distinct cyclamen. It is one of the crested varieties, of deep rose-red colour, but the great attraction is the fine white edge that runs round each petal and crest. The Messrs. Low state that this peculiarity is now fixed, as the second generation comes quite true from seed.

WOOD GARDEN HUTS

for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.

CARNATION CULTURE IN AMERICA.

The following paper was read at the recent convention of the American Carnation Society, at Pittsburg, by Mr. Joseph H. Hill, of Richmond, Indiana, under the title of "A Calendar of the Carnation." We reproduce it from the "Weekly Florists' Review":—

Many a member of this society was successfully growing carnations before I was born; others, comparatively young men, are already acknowledged authorities on the divine flower; and there are others here present who might, if they so desired, retire on their well-earned laurels and enjoy for the rest of their lives their well-filled coffers, the result of hard work, close application, and an unceasing attention to the demands of their chosen flower. In some portions of my discourse will readily be recognised the teachings of such men as William Nicholson and the Dailledouze Bros., to all of whom I am deeply indebted for kindly interest and instruction and unfailing response to any inquiry propounded. Other portions of this paper are records of my own observations and experiences, many of the lessons being quite expensive, as every grower has at times cause to confess as he sums up his columns of success and failure.

First Steps.

The middle of November witnesses the first steps looking toward the production of the millions of carnation plants required for the annual planting in this and other countries. At this time the grower puts into the sand those varieties which fail to make good plants from later-struck cuttings, and also those required by those of his customers who insist on "late December or early January delivery." While large numbers are taken in November and December, the bulk of the propagating is done considerably after the holidays, and often quite up to the first part of May. It is generally conceded that cuttings taken during January, February, and March will give the best results to the average grower, though most of us have seen grand blooms produced in quantity from good April cuttings.

Too much importance cannot attach to the careful selection of cuttings, which must be strong and healthy and from clean and vigorous plants. The old axiom quoted in Mr. Ward's book, that "like begets like," must never be lost sight of in this part of our programme.

In the Sand.

The cutting bench should have a brick or tile bottom, filled with three to four inches of absolutely clean sand, and so constructed that a bottom temperature of 60 degrees can be maintained. No draughts should be allowed to strike the cuttings, and they should also be protected from the direct rays of the sun by a perfectly clean and lightweight curtain of muslin.

The cuttings should receive a thorough watering when put into the sand, and the detrimental habit of using the hose whenever they show signs of flagging should be avoided, as this wilting invariably shows that overhead conditions are wrong, and these must be corrected rather than that water should be added to the already saturated sand. The less the amount of water used, if the cuttings are still kept fresh and plump, the better will be the root formation, and it requires a nice discrimination to properly adjust this matter.

Varieties differ greatly in the fibre of the first roots, the Enchantress family being notable for producing good, tenacious roots quickly; while Afterglow, the sturdiest, toughest stemmed variety in existence, must be handled with great care to prevent the loss of roots when taking from the sand, and must be allowed a longer time to mature.

Dibbled or Potted?

Then arises the question: Shall the cutting be dibbled into the soil, or potted? The former procedure is the easiest and the quickest, but I feel sure that the extra work of potting and repotting is doubly repaid.

The young carnation that is planted in the field or in the flowering bench from a pot, with its firm ball of earth, enwrapped with a network of roots, will show no ill effect from the shift, and will start right off into growth without a day's hesitation, while the lifted plant, in handling and resetting, loses most of the soil from around the roots, and receives a severe check from loss of moisture from its tissues. Especially is this the case if not revived by frequent showers soon after planting. Another strong point in favour of the young pot-grown carnation is exemplified when the plant is lifted from the field either for shipping or for immediate benching; the small pot ball of the spring-time will still be found intact, greatly protecting the roots from serious injury. One might be led to suspect that the speaker was interested in the pottery business, for if all the carnation men decide to pot all their cuttings before planting, it means millions of pots, but such is not the case; nevertheless, if any of the pot men present want to "fix it" with the speaker, he will be glad to meet them after we adjourn.

We endeavour to get our young stock up into three-inch pots before planting out, but often in the spring rush some lots have to remain in two and a-half-inch pots and grow on nicely, provided they have not become badly potbound.

In the Field.

When the first warm days come on, about mid-April, the inclination is to rush the stock out into the field, but I feel sure that it is a serious mistake to do so. In the house it has grown up in a temperature of from 45 to 50 deg., and with moisture judiciously supplied, so that it cannot but suffer and be seriously checked when subjected often to cold, severe frosts, and, worst of all, to wet weather and a falling thermometer.

In an ordinary season, if the planting is fully finished by the first part of June, good, big, healthy stock is assured, providing your soil has been properly prepared and possesses full quantities of plant food.

We have come to the conclusion that cross-checking the plants in the field, so as to cultivate them both ways with a hand cultivator, is not so good as to give them more room between the rows and draw the plants closer together in the rows. By spacing the rows twenty-eight to thirty inches, a horse and spiked-tooth cultivator can be used, greatly lessening the hand labour, besides loosening the soil to a greater depth. The inclination of the hand cultivator is upward rather than downward, thus failing of the intent to a certain degree.

About July 1 we begin to condemn the benches that are not producing a paying quantity of flowers, emptying the worn-out soil, and making them ready for our next year's hopes.

It is now a recognised fact that the returns from carnations cut in June and July come nearer being "real velvet" than those cut at any other time in the year, providing the plants have had the proper care and have not been neglected during the late spring rush.

(To be continued.)

FORTHCOMING ENGAGEMENTS.

MONDAY, April 11.—United Horticultural Benefit and Provident Society.

WEDNESDAY, April 13.—Royal Caledonian Horticultural Society's Spring Show: Two days.

Cornwall Daffodil and Spring Flower Show, at Truro; Two days.

THURSDAY, April 14.—Kingsbridge Daffodil Show.

British Gardeners' Association, London Branch.

WEDNESDAY, April 15.—Haarlem Second Special Bulb Show; Ten days.

TUESDAY, April 19.—Royal Horticultural Society: Narcissus and Tulip Committee at 11.30 a.m.; Fruit, Floral and Orchid Committees, at 12 o'clock. Lecture at 3 p.m. on "The Wild Flowers of the West of Ireland," by Mr. R. Lloyd Praeger, B.E., B.A.; Scientific Committee at 4 o'clock.

Devon Daffodil Show, at Barnstaple; Two days.

Shrewsbury Spring Show.

WEDNESDAY, April 20.—Royal Horticultural Society's General Examination in Horticulture.

Byfleet Daffodil Show.

Glamorgan Daffodil Show.

Huntingdon Daffodil Show.

THE BROWN ROT OF THE TOMATO.

The Board of Agriculture recently received, and published in its "Journal," the following note from Mr. C. K. Bancroft, B.A., on certain investigations on which he is engaged at the Jodrell Laboratory, Kew:

Brown rot disease is well-known to growers of tomatoes in this country, and during the past two or three years many have suffered considerable loss owing to the destructive nature of the pest. The fungus appears to attack the fruits only, the other parts of the plant show no external signs of infection. A fruit which is infected first shows discoloured patches on its surface; these usually run together, so that the whole, or almost the whole, surface of the fruit becomes discoloured. The pulp inside becomes reduced to a dark-coloured mass.

The seeds of infected fruits are of a darker colour than those of healthy ones, and a microscopic examination shows that, whereas the testa of the dark-coloured seeds is intact, the tissues of the endosperm and embryo contain fungal hyphæ, which from their characters appear to be hyphæ of Phytophthora omnivora. In spite of the occurrence of the hyphæ, the cells of the endosperm and embryo appear to be healthy.

This infected seed or "brown seed," as it is sometimes called, is known among the growers to be capable of germinating, and is reported to produce plants which always bear infected fruits. These facts, coupled with the results of microscopic examination of the seed, suggest that the hyphæ may be capable of existing in the seed in a resting condition, becoming active when the seed germinates, and keeping pace with the growth of the plant until the fruit is formed.

Whereas it is clear that "brown seed" always contains fungal hyphæ, the hyphæ cannot be regarded as being in a resting condition in the seed until they have been shown to be capable of activity when the seed germinates. Attempts are being made to ascertain whether this is so, that is, to trace the growth of the hyphæ in the seedling, and to demonstrate their presence in the mature plant.

A NEW,
CHOICE AND RARE HARDY PLANT.

DAPHNE, daf'-ne (*Garland Flower*).
***—cneorum,** a small spreading shrub, bearing rosy lilac flowers, the buds before opening are crimson, and so sweet that, where much grown the air often seems charged with their fragrance. It is one of the best of all plants for the rockery, thriving best in peaty and very sandy soils, but in stiff soils often fails. Wherever the soil or conditions are favourable, it should be used.

9 in. **1/6** to **2/6** each; **15/-** to **25/-** doz.

MONEY RETURNED IF NOT APPROVED.

OUR Renowned Catalogue of **Herbaceous and Alpine Plants,** not merely a price list, but a book of 200 pages, full of useful information, post free on application.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Proposed International Horticultural Exhibition.

Although those who attended the public meeting held at the Royal Horticultural Hall for the purpose of considering the advisability of holding a horticultural exhibition of an international character in London two years hence appeared much less enthusiastic than might have been expected, they were much impressed by the importance of the occasion, and readily gave their support to the preliminary proposals made by the Royal Horticultural Society. We have, since the meeting, had ample proof of the favour with which the proposed exhibition is regarded by all sections of the horticultural community, and from what has come to our notice we feel fully justified in anticipating a ready and generous response when an appeal is made for the necessary funds. Some horticulturists, whose opinions are deserving of the greatest respect, consider that it would have been an advantage had the Royal Horticultural Society undertaken the whole of the responsibilities of carrying out the exhibition, but we are of a different opinion, and consider that the course of procedure suggested is the best that could be followed. The splendid achievements of the past twenty-two years are sufficient proofs that the council would do all that was necessary, both in formulating the scheme and in carrying out the details, to ensure a great success. But by taking such a course as will enable all who are interested in horticulture to participate in the pleasure of bringing the project to a successful conclusion, the interest will be greatly extended, and the risk of any serious financial loss to the society be avoided. The financial responsibilities associated with an exhibition on the scale contemplated are heavy, as proved by the memorable gathering in 1866. At that exhibition the expenses were about £12,000, and one two years hence that would adequately represent British and Continental horticulture would not cost less. Then a guarantee fund equal to the requirements of the case was raised, and the same course will be taken now, the Council of the Royal Horticultural Society, intimating their willingness to contribute £5,000. The work that is being done at the present time is the formation of the general committee, in accordance with the resolution passed at the public meeting. No exception could well be taken to the names submitted by Sir Trevor Lawrence to the meeting, but we shall hope to see the committee materially strengthened when the "power to add to their number" is exercised. It is evident there should be a fuller representation of the nursery and seed trades, and that the names of some of the leaders in other branches of commercial horticulture be included. Not less desirable does it appear that the leading provincial horticultural societies and some of the more important of the national floricultural societies should be invited to nominate one of their principal officers as a member of the committee. The duties would be more or less nominal, but the inclusion of the names would show that the movement was having the support of the horticultural and floricultural societies throughout the United Kingdom. Whether the precedent of 1866 will be followed, and local committees formed in various parts of the United Kingdom, will not, of course, be known until after the committee has been formed and commenced work. The point will, we have no doubt, have full consideration in due course, for the amount raised by these bodies was considerable. The Glasgow committee, for instance, contributed £127, Chelmsford £50, Doncaster £50, and Belfast £35, and a number of the committees in the smaller centres contributed sums of £10 each. In this connection it may be mentioned that subscriptions were invited, as well as contributions to the guarantee fund: and that by the middle of November of the year previous to the show being held, the sum of about £3,000 was promised. The committee, in order to enable exhibitors to make their preparations for the exhibition, issued the schedule well in advance, the prizes aggregating £2,500. Large as was this sum it was no more than equal to requirements, and it is interesting to find that while in the GARDENERS' MAGAZINE and elsewhere there was some criticism of the manner in which the money was apportioned, the schedule gave general satisfaction. It may be assumed that the exhibition of 1912 will differ materially from that of 1866, but if the schedule is so arranged as to encourage exhibitors to give the best possible evidence of their cultural skill, the difference will be less than many horticulturists anticipate. We do not expect to see the huge specimens of stove and greenhouse plants, the giant roses, or the huge show and fancy pelargoniums, that were veritable surprises to visitors not well acquainted with plants and their cultivation. On the other hand, we may anticipate displays of orchids of great magnitude and surpassing beauty, groups of hardy trees and shrubs not less remarkable, roses in variety, and highly attractive collections of hardy rhododendrons and azaleas that far surpass the best of those shown four decades ago, so great is the improvement that has been effected. Alpine and herbaceous plants had classes provided for them in 1866, but they were then sparingly grown in private gardens, and the number of nurseries in which they formed strong features was not large. Exhibitors in those days had no conception of the beautiful effects they are capable of producing when arranged in a natural manner, and, while of interest, they did not contribute materially to the attractions of the show. Two years hence we shall expect to find hardy perennials in immense numbers, and so tastefully arranged as to form a feature of surpassing beauty. There are other aspects of the proposed exhibition to which reference might be made, but we shall not now do more than express the

MR. J. JENNINGS.

hope that the financial support will be such as to enable the executive not only to organise a show that will surpass that of 1866, but to return to foreign visitors the generous hospitality invariably shown to British horticulturists when taking part in the international gatherings on the Continent.

Mr. J. Jennings, head gardener to Leopold de Rothschild, Esq., at Ascott, Leighton Buzzard, comes from a good old gardening stock, for his grandfather was head gardener for thirty years at Haywood Hall, Alderley, Cheshire, and his father occupied a similar position for the succeeding thirty years. It was at Haywood Hall that the subject of the present notice had a good grounding in horticultural practice under his father, and passed on to Ingestre Hall, where, under Mr. Phipps, he stayed four years, and then, after a short stay with Messrs. James Veitch and Sons, Chelsea, he took up the position of foreman at Mentmore, under Mr. Slow. Five years were spent at Mentmore, and then Mr. Jennings proceeded to Ascott, where there was as yet no garden at all. This was in 1874, and Mr. Jennings has had the pleasure of seeing the gardens develop under his own hand until they have become famous throughout the country. It was Mr. Leopold de Rothschild's wish that Mr. Jennings should take up the culture of Malmaison carnations, and consequently he was one of the first to show the possibilities of these beautiful flowers. Starting with a stock of twelve plants of the Old Blush variety, Mr. Jennings increased the stock rapidly, and in 1885 exhibited two hundred flowering plants at South Kensington, and in the following year staged large groups at Liverpool, Manchester, Trentham, York, and he had a fine display at the first Temple Show. About a thousand Malmaison and tree carnations, flowering specimens, are grown each year at Ascott. Mr. Jennings was also one of the first to grow and show Begonia Gloire de Sceaux and B. Gloire de Lorraine, both of which are grown in large numbers at Ascott, together with many other winter-flowering plants, because Mr. Leopold de Rothschild and his family usually reside at Ascott from November until May. For this reason also a great feature is made of spring bedding, all kinds of early flowers and bulbous plants being used to produce a wonderful display of grace and colour. Mr. Jennings and the Ascott Gardens have grown up together, so to speak, and so it comes about that he has charge of departments that do not always come under the control of the head gardener; drainage, water supply, woodlands, electric light, dairy farm, and poultry, and the splendid golf course, are, with the extensive and beautiful gardens, all under his care. Not everyone has for employer such a genial and liberal patron of horticulture as Mr. Leopold de Rothschild, and naturally, under such a gentleman one does not have to "make bricks without straw," but all the same Mr. Jennings's position is no sinecure, and could only be filled by a skilful cultivator and clever organiser.

Daffodils at Kew.—Kew is well worth a visit just now, because there are so many beautiful spring flowers in bloom. The daffodils are splendid everywhere throughout the famous gardens, in beds and in borders, but especially where they have become naturalised as around the Cumberland Mound, along under the big Corsican Pine, near the main entrance, among the trees by the side of the Pagoda vista, and in the woodlands. The long border by the Duchess' Walk is planted with big breadths of the finer popular daffodils, while on the wall are Cydonia japonica and Prunus triloba in great beauty. The forsythias are a fine feature in the gardens, and the almonds, ornamental peaches, prunuses, etc., are in bloom, while Magnolia stellata is a mass of silvery white bloom in many parts of the garden. The beautiful green of the grass, and the fast-expanding leafage of deciduous trees and shrubs, all add to the many and varied attractions of Kew, and, in addition, there are the many interesting and beautiful occupants of the numerous plant houses.

Denorobium Dalhousianum at Woolton Court.—This handsome species, which was introduced to British gardens seventy-three years ago, is not so frequently met with in collections as might be wished, and, for some reason or other, it is not always seen at its best. Hence the specimens at Woolton Court, Warwick, of which Mr. J. W. Huckvale has kindly sent us a photograph, are of much interest. The average height of the pseudo-bulbs is six feet six inches, and the tallest of them is seven feet high. These specimens not only grow vigorously, but bloom freely, and this year they have produced nineteen racemes of the attractive flowers, and of these five have thirteen blooms each, with an average diameter of four inches. It would be interesting to know the conditions under which the plants are grown, and we shall be much obliged to Mr. Huckvale if he will send us for publication an outline of the method of procedure by which he has obtained such satisfactory results.

Metropolitan Gardens Association.—The annual report of this association shows that the members of the executive were remarkably active during the past year, and that they were successful in accomplishing much useful work. Not only have they been active in the converting of disused churchyards into gardens, the planting and pruning of trees in the public streets within the Metropolitan area, the laying out of West Square, Southwark, but they have kept a close watch over the measures introduced to Parliament, and vigorously opposed, with the assistance of several members of Parliament, important public Bills containing clauses which, it was feared, endangered existing open space legislation. During the summer of 1909 the association offered prizes for window gardens in twenty-five centres, and the competition was remarkably good throughout, as indicated by the fact that there were 825 entries. The number of prizes awarded was 199, and the value £28 3s. 6d.

Horticultural Club.—The monthly house dinner of the Club will take place on Tuesday next, April 19, at 6 p.m., at the Hotel Windsor, when Mr. C. Harman Payne will give a lecture on "Old Garden Books."

Scottish Horticultural Association.—The annual exhibition of chrysanthemums and fruits under the auspices of this society will be held in the Waverley Market, Edinburgh, on Wednesday, November 16 and two following days. As in previous years the most important of the several classes for chrysanthemums are those for fifteen vases of Japanese, three blooms in each, and eight vases of Japanese, three blooms in each. In the first of those classes the City of Edinburgh Cup and £12 are offered as the premier award, and the competition is open, and in the second Scottish gardeners and amateurs can alone exhibit, and the first prize consists of the Scottish Challenge Cup and £6. With the schedule we have received the "transactions" of the association, which include summaries of the papers that were read at the monthly meetings. These were, as in previous years, of a high order of merit, and afford reading at once interesting and instructive.

Delicate Roses, 1908-1909.—It may be of interest, observes one of the contributors of "Commonplace Notes" to the current issue of the R.H.S. "Journal," to note that the following varieties of roses proved delicate at Wisley, and, if not killed, were very severely injured. Each variety is planted in clumps of twelve, and the plants had stood were they were for three years. It should be said that the frost at Wisley was very severe, zero being registered by the grass thermometer. Mrs. Edward Mawley was one of the worst; practically all the plants were killed; Marquise de Salisbury was another that was severely affected; Niphetos, well known as a tender variety, maintained its bad reputation; Papa Gontier had always succeeded well, and stood the winter well, but 32 degrees of frost proved too much for it at Wisley. Safrano has always been a favourite of ours, because of its charming buds, but about half the plants were killed. William Allen Richardson was killed entirely; and almost the same may be said of Exquisite, only one plant being alive out of twelve. Both Perle des Jardins and its climbing form suffered badly, and Grace Darling, which is generally so hardy and vigorous, lost half its number. Madame Cadeau Ramey, Gottfried Keller, Princess Beatrice, and Princesse de Sagen, were nearly all killed; and even of La France 25 per cent. died. It seems to us that the last-named is not so satisfactory as it used to be. It is the first to be attacked by "rust," and a very large proportion of the buds never expand, but rot on the plants, not only at Wisley, but in many other places it behaves in the same way, and, as there are so many perfectly hardy and lovely varieties that are thoroughly satisfactory, we are seriously thinking of discarding this old favourite. It should be stated that all the roses named above were dwarfs on the briar stock.

Fertilising Effect of Soil Sterilisation.—In a communication to "Nature," Dr. Bernard Dyer writes with reference to this question: "Some of the large growers of cucumbers, tomatoes, etc., under glass for the London market have for some little time adopted the plan of injecting jets of steam into their soil before planting, not with any view of increasing its fertility, but with the view of destroying slugs, insects, etc. In the experience of some growers the productivity of the soil after steaming has become so greatly increased that, if anything like the usual quantity of stable manure is mixed with the soil, the plants grow with such rank luxuriance as to spoil their bearing capacity, exhibiting all the symptoms that would be expected as the result of a heavy overdose of nitrogen. This experience has been communicated to me by growers who were previously unaware of the Rothamsted work. At the moment they were feeling in somewhat of a dilemma; if they did not steam the soil they suffered from insect pests; if they did steam it they were obliged to curtail the supply of stable manure, at the expense of lowering the subsequent soil temperature, which is normally maintained at a high level by the fermentation of the manure. No doubt means may be found of adjusting the various conditions satisfactorily, but meantime the observation appears to afford striking independent confirmation on a practical scale of the indirect fertilising effect of partial sterilisation in killing off the phagocytes or protozoa which normally keep down the numbers of those bacteria the task of which is to turn organic nitrogen into plant food.

Studley Castle Horticultural College.—With reference to our recent notice of the Horticultural College for Women at Studley Castle, we would mention that the college now contains accommodation for sixty-five resident students, and that the number next term is expected to be between fifty and sixty, this being the largest number of students that have been in residence. The fees range from £60 to £80 for cubicles, and from £100 to £150 for study bedrooms.

Luther Burbank and the Carnegie Institute.—The reports that the Carnegie Institute had withdrawn its grant of ten thousand dollars a year to Mr. Luther Burbank, the American hybridist, appear to be founded on fact. But Mr. Burbank does not seem to worry about this withdrawal, and is quoted as saying: "The grant brought with it cares, responsibilities, correspondence, and visitors, and envious criticism. But for the advice of friends I should have dissolved my connection with the institute last year. I am now past sixty years of age, have done good work, and no one is dependent on my efforts Personally I have no desire for wealth or fame. My ambition has been to leave the world the better for having passed this way."

Fruit Congress and Show at Hexham.—The arrangements for the Fruit Congress and Show to be held at Hexham on October 20 and two following days are now complete, and there is every promise that both the congress and the exhibition will be successful. Owing to the manner in which the programme of the congress is arranged, it is not quite so clear as could be wished, but as we understand the entries, the subjects that will be discussed are as follows: Thursday, October 20, 3.15 to 5.15 p.m.: "Fruit Storage and the Bottling of Fruit," the speakers being Mr. G. Berry and Mr. W. B. Little, the latter taking "Storage"; 6 to 9 p.m.: "The Best Hardy Fruits for the North of England, the Best Varieties, and the Best Stocks," the speakers, Mr. H. Somers Rivers ("Stocks for Fruit Trees Historically Considered"), Mr. G. Bunyard, V.M.H. ("Manners and Culture of Fruit Trees"), Mr. J. S. Chisholm, Mr. W. B. Little, Mr. G. O. Rimington, and Mr. J. W. Robson. Friday, October 21, 11 a.m. to 1 p.m.: Demonstrations of Spraying and Smudge Fires; 3.15 to 5.15 p.m.: "Enemies to Fruit Culture," "Fruit Pests and their Treatment," and "Orchard Heating," the speakers, Mr. F. V. Theobald, M.A. ("Fruit Pests and their Treatment"), Mr. H. Hogbin ("Smudge Fires in the United States and Elsewhere"), Mr. F. J. Chittenden, and Mr. R. A. H. Gray, M.A.; 6 to 9 p.m.: "Intensive Culture," and "Bees as a Factor in Fruit Culture," speakers Rev. H. Purefoy Fitzgerald, Mr. C. H. Hooper ("Small Holdings"), Mr. G. W. Avery ("Bees as a Factor in Fruit Culture"). Saturday, October 22: 10 a.m. to 1 p.m.: "Co-operation in the Marketing of Produce," speaker Mr. W. H. Press; 2.30 p.m. and 3 p.m.: lectures on "Fruit Bottling," Mr. J. S. Chisholm. The National Fruit Growers' Federation will hold a meeting on the 22nd inst., at 4 p.m. A deputation from the Royal Horticultural Society will attend and award medals and other prizes to deserving exhibits, and the Scottish Horticultural Association are sending representatives. The general secretary is the Rev J. Bernard Hall, Dalston, Cumberland.

RUBBER YIELDING PLANTS.

The remarkable development within recent years of the motor industry has so largely increased the use of rubber that the demand for this product has outstripped the supply, and prices have gone up by leaps and bounds, and created an immense amount of interest among all classes of the community. As the prices are likely to maintain their present high level, for some years, at all events, there is a probability of the rubber industry continuing profitable, a fact that has attracted the attention of capitalists, with the result that a large number of rubber companies have been recently formed. The financial aspect of the industry is not within the scope of these notes, which have been written simply in compliance with the requests of several correspondents, who have asked for information relating to the plants from which rubber is obtained.

In the first place, it should be stated that the number of plants producing rubber is considerable, and that they differ very materially in their relative value in the production of rubber for commercial purposes. The most important of these is Hevea brasiliensis, a tree attaining to a considerable height, and belonging to the natural order Euphorbiaceæ. This is the source of Para rubber, which has long held a commanding position in British markets. Ranking next in importance is the well known Ficus elastica, which belongs to the natural order Urticaceæ, and produces the Assam rubber. Landolphias, woody climbers, belonging to the natural order Apocynaceæ, yield the African rubbers, and Sapium biglandulosum, belonging to Euphorbiaceæ, produces the Columbian rubber. Kickxia africana is the source of the Lagos rubber.

Hevea brasiliensis.

Para rubber is obtained from several species of hevea, but by far the most important of them is H. brasiliensis. This species is widely distributed in South America, and, with other members of the genus, is strongly represented in the region drained by the mighty Amazon and its tributaries. Hevea brasiliensis is called by the Portuguese "Pao de Serringa," and is a rather slender-growing tree, attaining a height ranging from fifty to sixty feet. The leaves are digitate-trifoliate, and the flowers are borne in panicles. The tree is by no means attractive, and with reference to its appearance Consul W. A. Churchill, in one of his reports on the trade of Para, writes: "The hevea tree is not conspicuous, and resembles many other forest trees. People have travelled thousands of miles through the rubber region, and have lived for years in the centres of the industry without ever noticing it. The newcomer invariably expects to see the glossy, dark green leaves of the ficus, and is disappointed with the insignificant appearance of the hevea. In habit it is more like the English ash than anything else. The localities where rubber trees thrive the best are on islands and low grounds, where the banks are periodically inundated. Ground that is above the water or that has no drainage is not so suitable to the tree."

The history of the rubber industry on the Amazon extends over about sixty years. With reference to its early days, R. Spruce states, in Hooker's "Journal of Botany," vol. vii., that when he ascended the Rio Negro in 1851 he pointed out to the inhabitants the abundance of hevea trees they possessed in their forests, and tried to induce them to extract the latex. Yet they shook their heads, and said it would be no good. By 1854 the demand had become so great that the price had risen to what Spruce describes as the "extravagant sum of 2s. 9d. per pound." This woke up the people from their apathy, and "Mechanics threw aside their tools, sugar makers deserted their engenhos, and Indians their roças, so that sugar, rum, and even farinha, were not produced in sufficient quantity for the consumption of the province." This state of things has practically continued until the present time.

The town of Para, the centre of the rubber industry of the Amazon, is on the River Guama, about 100 miles from the sea, and is in south latitude 1 degree; but the Para district extends over a large region to the south and west. Throughout this, and the forests of Central and Northern Brazil, rubber trees are abundant. The temperature is uniform, and usually ranges from 87 degrees at midday to 74 degrees at night. The rainy period extends over the first six months of the year; the heaviest fall is in April, when the average is 15 inches. The country is flat, and intersected by rivers, and the dense moist forests in which the rubber trees are the most abundant are damp and unhealthy. The soil is deep, comparatively heavy, and very fertile.

Rather more than thirty years ago the suitability of Hevea brasiliensis for cultivation in India was recognised, and strenuous efforts were made to introduce the tree to Ceylon and other parts of our Eastern possessions in sufficient numbers to carry out experiments on a large scale. The difficulties were considerable, but they were eventually surmounted, and there are now large areas of rubber trees that are giving an ample return. The most suitable areas for the cultivation of this tree in Ceylon has been found to be sites that are rather flat, just above the sea level, and with a good alluvial soil. Eight or ten feet apart each way is considered a good distance at which to plant the trees, and then to thin to twelve or fifteen feet, as may be considered advisable. By this course of procedure the less satisfactory trees can be removed at a comparatively early period; and those remaining are encouraged to produce straight trunks, with but few branches low down, a point of importance, as the work of tapping the trees is greatly facilitated. Under favourable conditions the trees grow with great rapidity, and it is recorded that rubber trees planted at the Henaratgoda Garden, Ceylon, have attained a height of fifty feet, and a girth of two feet from the surface of the ground, in six years. Trees of this size may be tapped with very good results, but it is considered an advantage to allow them to remain untouched one or two years longer.

Briefly stated, the best method of tapping the trees is to lightly shave the trunk with a knife from a height of about six feet to the base, the object being to obtain a smooth surface over which the milk can flow. Then with chisel and mallet V-shaped incisions are made on the shaved portions, care being taken not to cut deeper than the bark close to the cambium layer. These cuts are made on all sides of the tree, and at a distance of about twelve inches below each other down to the base. The usual practice is to have four vertical rows of incisions on each tree. Channels are formed with clay at the base of the trees to catch the milk as it trickles down the stems, and to conduct it by two or more spouts into clean cocoanut shells so cut as to form two small basins. When the milk ceases to flow the cocoanut shells are removed to a warm place, and in a few hours it becomes coagulated, and can be removed as solid cakes of rubber. The remainder of the milk coagulates on the trees, and can be removed as strings of rubber. Trees in a vigorous state will yield from 1lb. to 1½lb. of rubber annually.

Ficus elastica.

This tree, the "indiarubber plant" of gardens, and the source of Assam rubber, is so well known as to render description unnecessary. When growing in its native habitat, and under cultivation where it has sufficient space for its full development, presents a very different appearance to the largest of the specimens that may be met with under glass in this country. It, indeed, spreads so freely in cultivated plantations in Burma and elsewhere that eighteen plants to the acre are considered quite sufficient. It is found growing wild in moist forests from the base of the Sikkim Himalaya, eastward to Assam and Arracan, and in Upper Burma it is so plentiful as to form large forests in the valley of Hookhoom. The development of the seedlings when growing naturally in the forests is very interesting, as will be gathered from the following extract from the report on the tree by the Conservator of Forests, Assam.

"The seed of Ficus elastica, where the tree grows naturally in the forests, germinates almost invariably in the forks of trees thirty to forty feet and more above the surface of the ground, and the young trees grow, in consequence, for some six or ten years as epiphytes, after which the aerial roots reach the ground and increase rapidly in size until some of them reach a girth of from four to six feet; they are very numerous, and it is not uncommon at a later age that they are thrown out also from the upper branches sixty to eighty feet from the ground, being first as thin as whipcords, but very soon increasing in size after they have reached the ground; it thus frequently happens that the tree on which the young rubber seedling first germinated is killed by the more vigorous-growing Ficus elastica, which in this respect resembles the well known banyan tree, and is one of the largest growing members of our mixed forests in Assam. It requires an exceedingly damp atmosphere to do well, and, therefore, thrives best at the foot of the mountains or on the mountains themselves up to an elevation of 2,000 feet. It is met with also at a higher elevation, but not so vigorous, and at 5,000 feet it is liable to be injured, or killed by frost.

Under cultivation the seedlings are raised in beds, boxes, or pots, the seeds being sown on the surface of the soil, and as the seedlings are very small at first they have to be treated with great care. In planting them out they are put on mounds three or four feet high, formed with soil, cut wood, and any rubbish that may be at hand.

With regard to the yield of rubber, it is estimated that eighteen trees, occupying one acre, will annually produce 40lb. One man is able to tap three trees, or collect the rubber from two trees in a day, and, consequently, the cost of tapping the trees and collecting the rubber is not great.

In Upper Burma the rubber industry appears to have undergone considerable development since rubber was first exported forty years ago. Ficus elastica is described as occurring throughout a district extending several miles north of Mogoung, and eastward beyond the Chinese border. The largest and most regular supplies of rubber have been obtained from forests a few days' journey north of Kamein, but the supplies from the Endaw and Laetsun districts are largely increasing. The Kachins are careful in tapping their trees, and in collecting their rubber, and avoid the mistake that is made in some rubber-producing districts, of over-tapping.

Other Rubber-producing Plants.

The rubber industry has undergone considerable development in Lagos within recent years, and the value of the exports of this product is now considerable. There are a considerable number of rubber-bearing trees in the forests, but by far the most important of these is Kickxia africana, a tall tree belonging to the natural order Apocynaceæ, which yields an abundance of latex. It is described as one of the most beautiful trees in the Lagos forests, as attaining a height of between sixty and seventy feet, and having an average girth of about forty inches. In tapping the trees the bark is cut in a vertical direction for a considerable length of the trunk, the cut being about half an inch wide, and of a sufficient depth to reach the cambium layer. On each side of this line oblique grooves are cut, each connecting with the main channel; these oblique cuts being made about two feet apart. A vessel is placed at the bottom of the main channel to catch the latex, or milk.

Manihot Glaziovi, the source of what is known as Ceara rubber, is a moderate-sized tree belonging to the natural order Euphorbiaceæ. It is described as ranging from forty to fifty feet high, and as having a stem ranging from ten to twenty inches in diameter. The tree when fully grown somewhat resembles the birch, and the leaves are palmate. The tree is a native of the mountains some thirty or forty miles from Ceara, and here the climate is dry for a considerable part of the year. It has been introduced to various parts of India, but the yield of rubber was not considered sufficient to justify its cultivation. With the high prices now obtaining it appears well deserving of a trial on commercial lines in such of the British Colonies within the tropics as possess a dry climate and poor stony soil.

Castilloa elastica is one of the chief sources of Central America rubber, and is of much importance. It extends over an immense area in Central America, and in the forests the trees suffered much for a long period from the injury done by excessive tapping. The tree is tall and handsome, and has smooth white bark. It requires a deep, moist soil, a high temperature, and in the formation of plantations the trees should be put from eight to ten feet apart each way. In collecting the latex long vertical cuts, about three-quarters of an inch wide, are made, and in making these care is taken that one-third of the trunk remains intact. As in other cases, the flow of latex is conducted to a vessel placed at the base of the tree.

FORESTRY IN THE NORTH.

A distinguished company of Scottish landowners, which included the Earl of Dalkeith, Lord Lovat, Lord Richard Cavendish, Sir John Stirling Maxwell, Captain Stirling of Keir, Mr. Macdonald of Largie Castle, Mr. Novar Ferguson of Novar, M.P., Mr. Sydney J. Gammell of Drumtochty, recently visited several extensive forests in Aberdeenshire. Some time ago a scheme for the afforestation of a large area in Aberdeenshire for demonstration purposes was brought forward, and it was in connection with this question that the large party came for information. Mr. William Dawson, lecturer in forestry in the University of Aberdeen, carried out in an admirable manner all the arrangements for the tour.

Early on the first day the party left Aberdeen in motors, the destination being the famous Durris Woods, some 12 miles up Deeside, and owned by Mr. Baird. There the party was met by Mr. Lees, factor, and Mr. Crozier, head forester on the estate, who acted as guide. For the past 12 or 15 years the progress of plantations of the Douglas fir at Durris has been watched with considerable interest, their remarkable growth being the subject of comment by all who have seen them. There is also a fine forest of Sitka pines growing at an elevation of 1,000 feet on the estate. In addition there are excellent plantations of Japanese larch and other trees, all of them showing how trees may be grown to great advantage on Deeside.

After inspecting the nursery, and the large stocks of Douglas fir there, the party proceeded to the wood upon the slope of Strathgyle, where was inculcated one of the finest lessons in forestry the Durris estate affords. This wood is about 60 years of age, and consists of various species of conifers. Among these the Menzies spruces attracted special attention, as their success on the exposed hillside at about 900 feet above sea level is quite remarkable. Some of these trees are about 50 feet high, with an average diameter at breast height of 9 inches. As a tree for hill planting Menzie's spruce has proved its superiority over the larch, Scots pine, and Norway spruce in a marked degree, its power of resistance to high winds, and its general reliability on exposed heights being notable. The timber is light, straight grained, and easily dressed. The whole party expressed admiration at the size and healthiness of the spruces. In the Sawmill, Sunnyside, and Balladeam Woods some fine specimens of the Douglas firs were seen. In the latter wood there are 74 acres of continuous Douglas firs—an area believed to be the largest yet planted. In every case the growth was of a superior kind, and earned the warm encomiums of the party. At Northbrae Wood—an oak wood—between 60 and 70 years of age, was seen underplanting with Douglas firs. This has been done in the expectation of improving the growth of the oaks. On the upper part of Northbrae, a Scots pine plantation was seen. Laid down in 1882-1885, it has not yet been thinned. The result of this has been to draw up the stems with a minimum of side branches, thereby producing the best quality of timber. The party expressed their great admiration of all they had seen, and, having warmly thanked their hosts, proceeded a few miles further up Deeside to the woods of Ballogie, owned by Mr. Nic[illegible] where they received valuable information.

The party reached Ballater at night, where they put up at the Invercauld Arms Hotel. Next morning accompanied by Mr. John Michie, M.V.O., His Majesty's Commissioner at Balmoral Castle, but previously head forester on the Royal estate, the party proceeded to inspect the Royal forests. The first visited was Birkhall, but most interest was taken in the old forest of Ballochbuie, where the whole afternoon was spent. The weather was superb, and there being much of interest in the fine old Scots pines, much information was gleaned. Than Mr. Michie no better and no more qualified cicerone could have been wished, for he has practically been brought up in the Royal forests. Here great interest was taken in the Douglas firs, and the various systems of management, as explained by Mr. Michie. Thereafter they proceeded to the Duke of Fife's Mar estates—what Scotsman has not heard of "The Standard on the Braes o' Mar"?—where they were met by Mr. Lawson, his Grace's factor. Here, also, the party found much to admire and inform. Having spent a considerable time here, the party returned to Ballater, and stayed [illegible] the night at the Invercauld Arms.

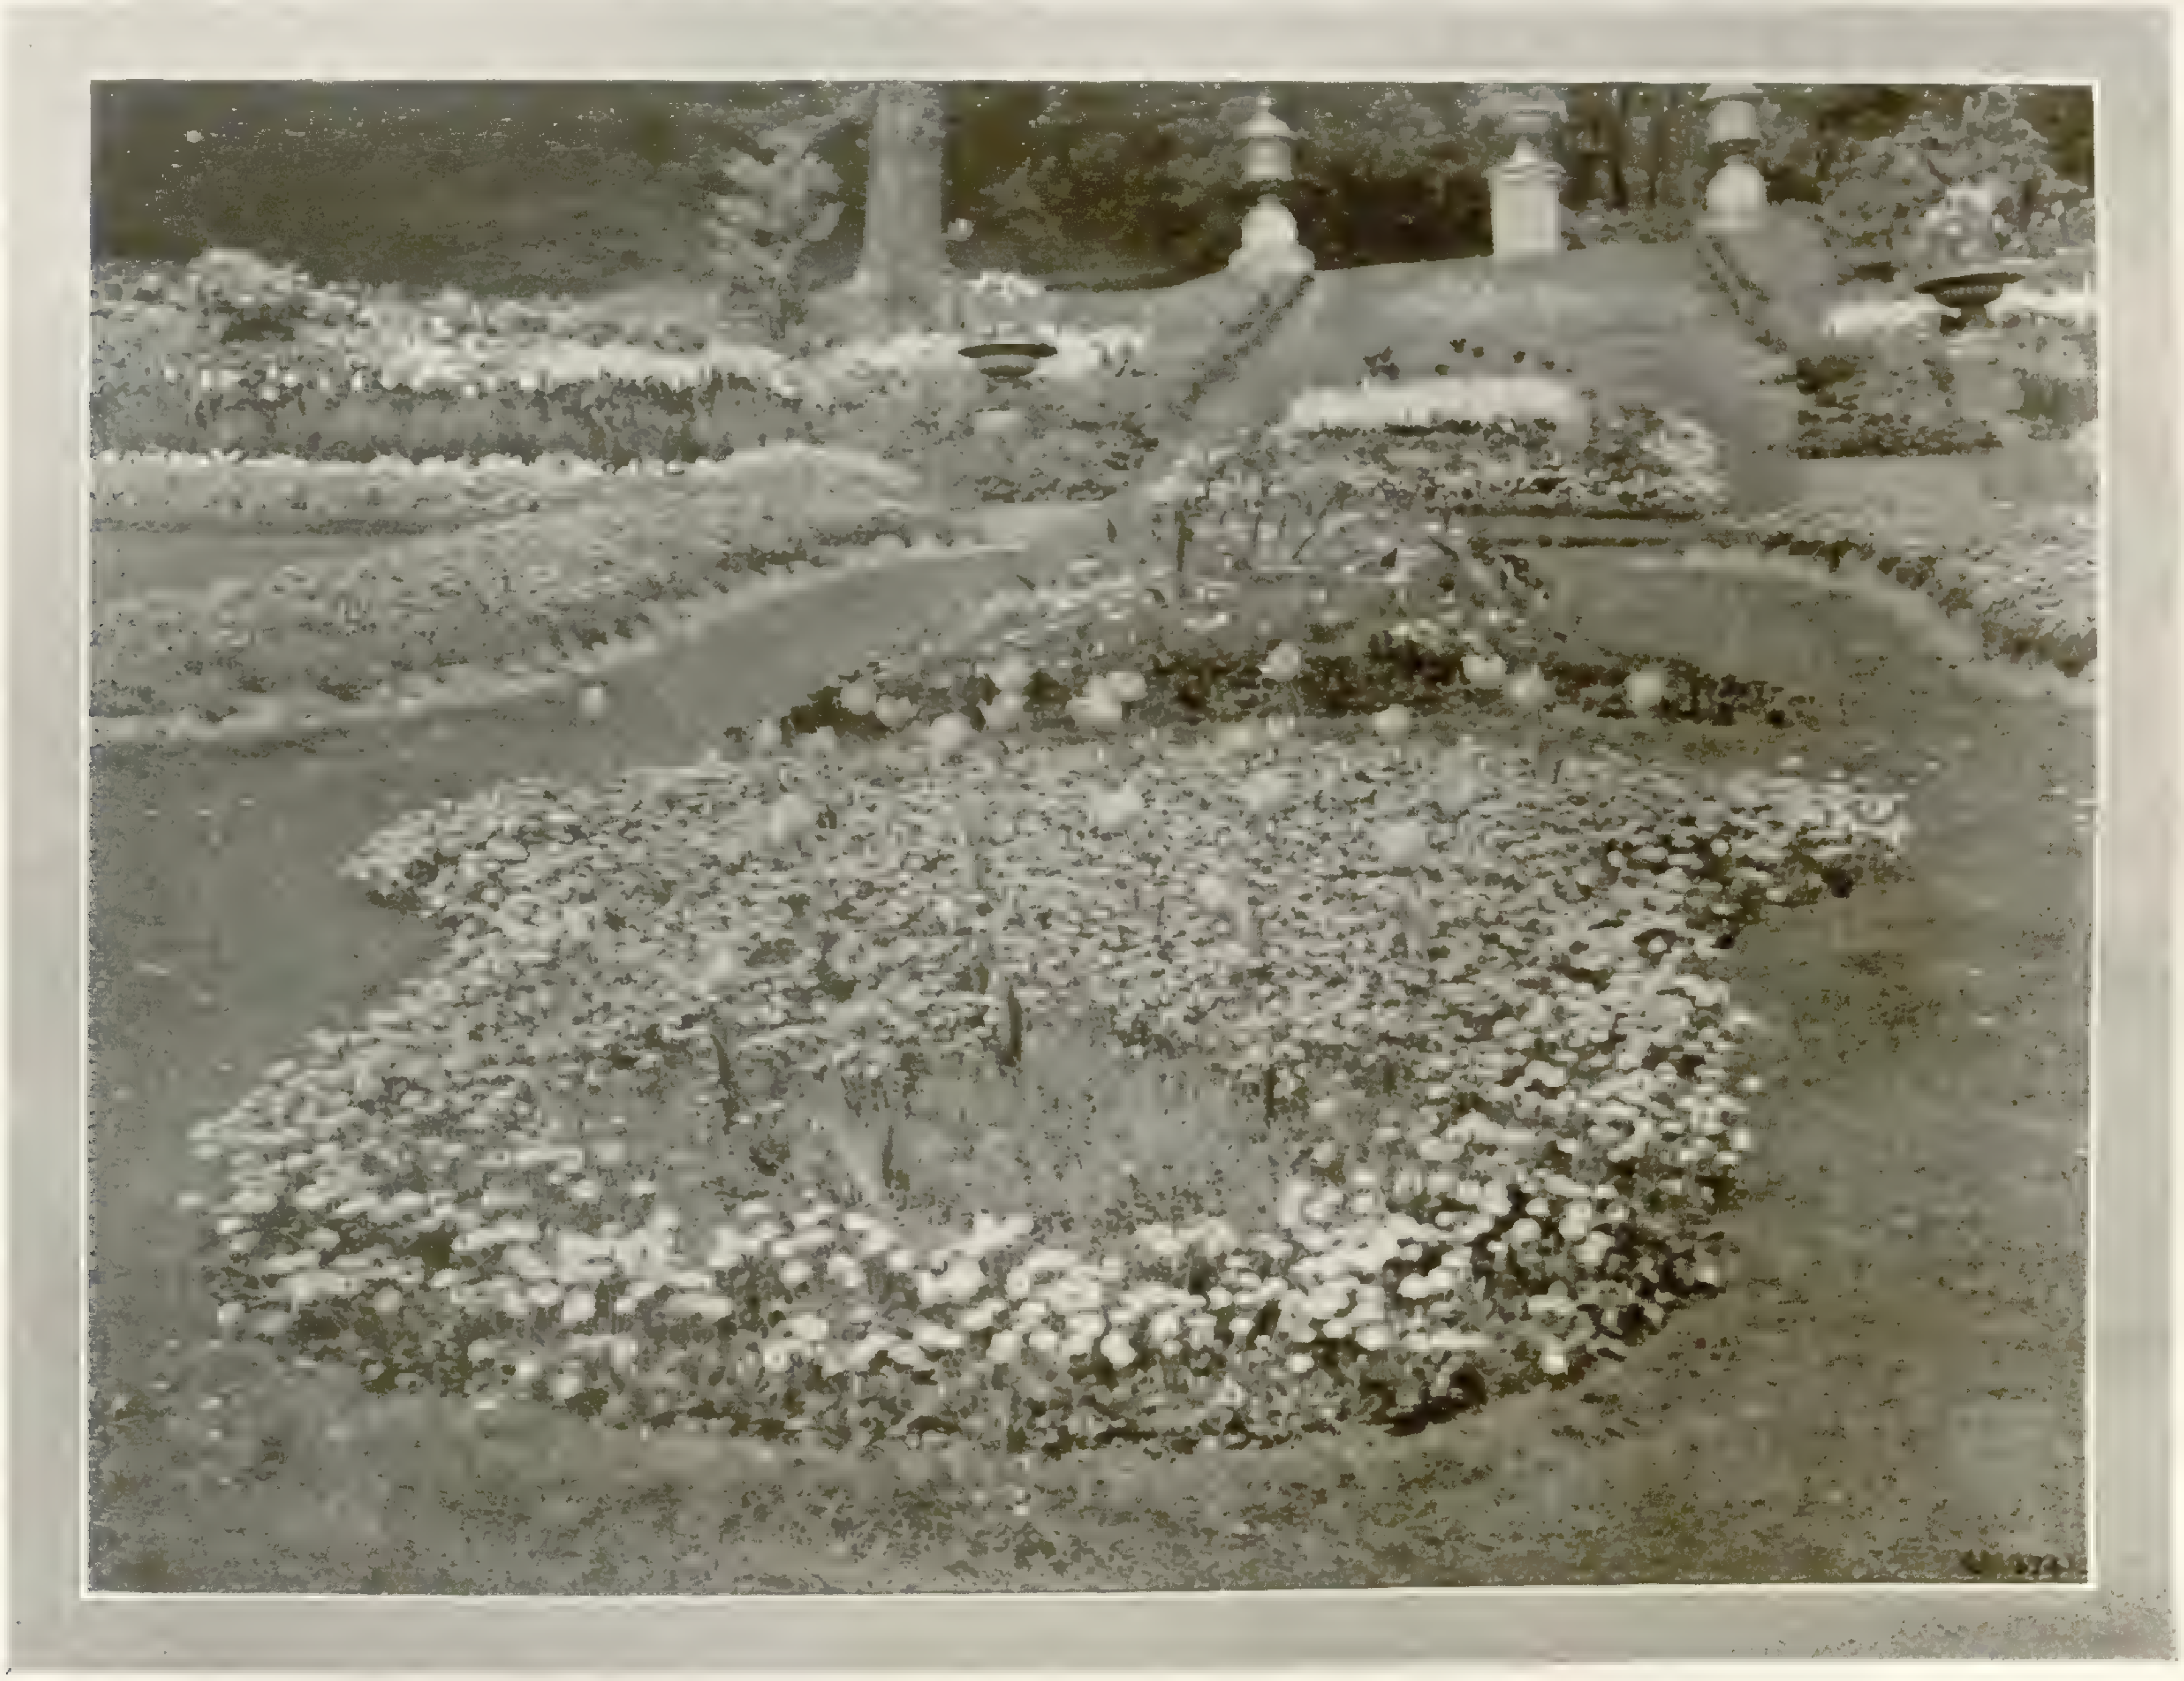
On the forenoon of the third day the members motored into Aberdeen, where they found awaiting their inspection in the Forestry and Botanical Departments of Aberdeen University an excellent exhibition of forestry products, arranged by Mr. Dawson. A large section of the exhibition demonstrated the damage done to forests by deer, squirrels, robbits, insects, and fungi. The effects of the various diseases trees are subject to were admirably demonstrated. Another section showed to fine purpose the economic uses of wood, including numerous articles of commerce, and showed how by mechanical processes—steaming or otherwise—wood may be put in any shape desired, even to a perfect circle. Numerous other exhibits were also on view, with all of which the visitors declared themselves greatly pleased.

After dining together in the Palace Hotel, Aberdeen, the members of the party left for their various destinations highly delighted with their tour.

Great Orchid Show in America.—On May 26, and four following days, the Massachusetts Horticultural Society is to hold a grand exhibition of orchids in Boston. There are thirty classes for orchids and six for other plants, and the first prize in many cases is a gold medal, with, in the more prominent classes, the addition of from a hundred to a thousand dollars in cash. The last amount is for the best display of flowering orchids, embracing at least twenty genera, and arranged on a space of 400 square feet. An interesting class is one for a group of botanical orchids, not less than twenty [illegible] plants, representing not less than [illegible] genera.

SPRING FLOWERS AT BELVOIR CASTLE.

The gardens of Belvoir Castle, the stately seat of the Duke of Rutland, have long been famous for their annual displays of spring flowers, and long are they likely to sustain their fame, for their noble owners take a warm interest in them, and Mr. W. H. Divers has entered so thoroughly into the spirit of the place that he was not many years in charge before he surpassed the efforts that brought the gardens into prominence. Having accomplished this, he has year by year effected such improvements on his previous successes as to suggest that he has now reached a point in the use of hardy plants beyond which it is hardly possible to go. We carefully guard ourselves against saying that he has done so, because to a gardener of Mr. Divers' ability finality in a matter of this kind is practically unknown, and to so keen an observer there is, we apprehend, no difficulty in finding in some of the numerous arrangements that form part of the general scheme, room for still further improvement. However that may be, Mr. Divers is not less successful in the arrangement of the several subjects than he is in their cultivation, and the charming effects that are annually produced are veritable surprises to visitors.



VIEW IN DUCHESS' GARDEN, BELVOIR CASTLE.
Showing the successful use of aubrietias and daisies.

We have on several occasions described the Belvoir Castle gardens at some length, and therefore we do not intend on this occasion to more than briefly refer to the aubrietias which are used with so much success in the Duchess' garden. This garden, which is so popular with visitors, is situate about half a mile from the castle, has an area of about eight acres, and occupies a naturally-formed hollow on the side of a hill. Sheltered on all sides by large trees, the garden is much warmer than might have been expected so far north as Grantham, and a large number of trees and shrubs thrive that are not often seen at their best except in the western and southern counties. In this garden is a fine specimen of the rare Cunninghamia sinensis approaching a height of forty feet; Daphniphyllum glaucescens, a specimen of the handsome Japanese maple Acer palmatum septemlobum, between eighteen and nineteen feet high, and with a head of a proportionate diameter; a large group of camellias that is gay with colour early in the spring; Eucryphia pinnatifida, over thirteen feet high, and producing a wealth of the exquisitely beautiful white flowers annually; Styrax japonica, rhododendrons, and hardy azaleas in variety, and a host of other good things.

Within this garden are numerous beds, varying in form and size, in which two distinct displays of flowers are produced annually, the first comprising aubrietias and other subjects blooming during the spring months, and the other tender and hardy plants that, by suitable preparation, yield of their charms during the summer months.

In common with violas, wallflowers, arabis, ,myosotis, and polyanthuses, aubrietias are very largely grown, and used with much taste in the production of large masses of colour, and also for carpeting beds that are planted with tulips. At one time it was the practice in the Belvoir Castle gardens to raise the stocks of these flowers from seed. But Mr. Divers has an objection to the practice because none of the forms come true from seed, and there is in consequence a difficulty in producing satisfactory effects. The aubrietias most largely used are the purple Hendersoni, the blue græca, the crimson Leichtlini, the pink Moerheimi, and the purple Dr. Mules. About seven thousand plants are annually required for filling the beds, and to raise so large a number is not an easy matter when the ordinary course of procedure is followed. Mr. Divers has under preparation two sets of plants each year. When the aubrietias are taken from the beds at the end of May they are planted on a shady border, and the soil trodden firmly about them. They remain in the border until the following March, when they are furnished with an abundance of young growths. They are then lifted and pulled into small pieces with roots attached and planted twelve inches apart each way in rich soil. By the autumn the plants will be nine or ten inches in diameter, and in the best possible condition for filling the beds. Daisies, as will be seen in the accompanying illustration of one of the beds in the Duchess' garden are largely used, and these are raised from seed because of the heavy losses that occur among choice varieties raised by means of division.

Strelitzia Reginæ.—Planted out in the warmer part of an intermediate house, this striking feature of South African vegetation is highly effective. From the quaintness of its flowers and their marked contrasts in colour, it is a subject that at once appeals strongly to the uninitiated. The leaves are something like those of a canna, but of a stout leathery texture, and the flower scape, which well overtops the foliage, will reach a height of 4 to 5 feet. The flowers are in shape suggestive of a bird's head, the sepals being of the richest orange colour, while the petals are of bluish purple. —K.

CROP-SICK SOILS.

When we speak of a soil being exhausted, or crop sick, it is not meant that there has been a complete deprivation of crop-producing power, but simply a reduction of this power below a profitable point.

Many persons imagine that all that is required is for a chemist to make an analysis of the soil to determine which are the plant-food elements lacking therein in order that these may be supplied, and productiveness established. But recent experience too often shows that what is called an exhausted soil may be well supplied with all needful plant food, and yet the crop fail to make satisfactory growth.

For example, at the Rothamsted Experimental Station an experiment was conducted for twenty-six years on the growth of potatoes on the same land. There were ten plots, one received no manure at all, the others received either farmyard manure, or various artificial manures, both nitrogenous and mineral, either alone or in combination. The manures were applied every year.

At the end of the twenty-six years the experiment had to be abandoned because the land absolutely refused to grow potatoes. It mattered not what the description of the manure applied was, farmyard manure or artificial fertilisers, the crop equally failed. What, we may ask, was the cause?

It could not be lack of plant food, for in the following year (1902), after the experiment with potatoes was stopped, the land was sown with barley, without manure. The yield on some of the plots was 72 bushels of grain per acre, and the plot which had received no manure of any kind for twenty-seven years gave 33 bushels of barley per acre.

In the following year (1903) barley was sown again without any manure, and the results were 9½ bushels per acre, on the permanently unmanured plot, rising to 47 bushels per acre on a plot which had previously received farmyard manure. In 1904 oats were sown, and in 1905 and each year since barley has been grown without manure, and produced last year 24¾ bushels per acre, showing that even after eight years of corn cropping without manure this potato-exhausted land yielded a fair barley crop.

Of what, then, does soil exhaustion and crop-sick soils consist? It usually means that plant food materials, which may still exist in the soil, no longer occur in that condition in which a particular crop can make use of them, but another crop of a different food requirement, and having a different root range, may be able to appropriate what was unassimilable to the former crop. Thus the acid and other toxin accretions given off by the roots of one particular crop may become by conversion, through the aid of the various bacteria of the soil, available food for a crop of another kind, hence one great value of a rotation of crops.

Hitherto cultivators of the soil have, with few exceptions, given no thought to the invisible bacterial life that plays such an important part below the surface of the ground, and through whose agency crops and individual plants are enabled to respond to the fertilisers added to a well-tilled soil.

Yet this rational conception of the fundamental causes of productiveness will in future have to be taken into account by horticulturists and gardeners in every department of their work, if they wish to progress with the times, and aim at deriving the greatest benefit from capital and labour invested in their establishments.

As it is now known that the fertility of a soil is largely determined by the activity and number of its ammonia-producing bacteria, it becomes a point of much interest to find out what is the special microbe or class of microbes that are most beneficial to the particular crop we wish to grow. It is recognised that after about twenty-five years of continuous growth of cucumbers or tomatoes in a glasshouse, even although the surface soil may be renewed from time to time, these crops become a failure. They either refuse to grow, or they get attacked by injurious insects or fungoid growths.

The only known remedy appears to be either a rotation of crops or the incorporation into the soil of some antiseptic which will help the bacteria we wish to encourage, and destroy or render harmless those microbes which are detrimental to the crop grown.

It has been found at Rothamsted that partial sterilisation of the soil by heating to 100 degrees for two hours, or treatment with antiseptics kills off certain organisms, but leaves unhurt some spores of the ammonia-producing bacteria, which afterwards can develop to a much greater extent, because they are freed from the normal checks.

This subject is now receiving most careful investigation at the Rothamsted Experimental Station, both in the laboratory and in the field.

J. J. Willis.

Harpenden.

STOPPING PERPETUAL CARNATIONS.

Space will not permit me to deal with this subject beyond the first stop given to the young plants.

The two difficulties which confront the average grower, who may have had more experience in the several other branches of this wide field of horticulture than in actually growing perpetual carnations, are, the correct conditions in which to have the young plants for stopping, and where to stop them.

It is a matter of the most vital importance that the young plants should be in a vigorous, healthy condition when stopped, and this state can only be promoted and maintained by a free root action. If the young plants receive a check for want of potting, the growth becomes too woody and hard, so that instead of making some four to six strong breaks, only two or three are produced at the top of the young plant. These are fed through a hard stem, which naturally means an impeded or reduced food supply.

Again, if the young plants have been shaded, or grown in a poor light, the growth will be too soft and sappy, which, in turn, will not produce the full crop of breaks, whilst plants which have received a reasonable amount of care and attention, being grown in an airy position, with full sunlight, and potted as required, will have a matured growth, which will break at every eye, thus laying the foundation to a good plant.

We, here in England, have certain hereditary rules, which we are tempted to apply by force of habit to all classes of plants. Above all things, the Britisher loves a compact, bushy plant, with breaks close to the surface of the soil, and while I agree that such is, as a rule, a token of good craftsmanship, yet, in the interest of the perpetual carnation, I maintain an exception should be made in its case.

The fact is obvious to all that the natural breaks, or side growths, produced in the middle of a branch or growth, are much stronger and quicker growing than unnatural ones produced at the base of the growth. Our American friends, who, all the world will admit, are the greatest exponents of the cultivation of the "divine flower," stop all the varieties which can be so treated when the young plant commences to elongate for flower. Naturally, there are two or three inches of stem at the base of the plant, but this they do not mind, so long as they get the strong natural breaks which produce the finest flowers.

What I mean is this. Take a young plant established in a four-inch pot. If it was stopped about two inches above the surface of the soil that would be termed hard stopping. The plant would be compelled to produce unnatural breaks. To stop the plant, say, four inches from the soil is medium stopping, but to allow it to elongate for flower before stopping the growth is long stopping, and this, if cultivating, as the market growers do, purely and solely for quality of flower, and with no thought as to the shape and appearance of the plant, is the best method.

However, I recommend the ordinary grower, who must consider the appearance of his plants to a degree, to treat the groups of varieties as follows: Such long, loose-habited varieties as White Perfection, Winona, Pink Delight, etc., should be stopped hard in the first place, otherwise the plants become spindly and quite unruly, whereas Enchantress, Afterglow, Beacon, May Day, Winsor, etc., enjoy medium stopping. Such varieties, however, as Britannia, Black Chief, Mrs. Burnett, Rose Dore, Rival, etc., which naturally make large plants, must not be stopped at all late for winter bloom. These should be treated by long stopping. It is also well to note that this last group of varieties thrive best if potted into their flowering pots early, say, in May or June, so as to be well-established before the autumn. I think that nearly all growers are agreed that a seven-inch pot is sufficiently large for the last-named group of varieties, and that they produce more and better flowers if so treated.

Regarding the actual stopping (or topping) itself. There is only one correct way of doing it, and that is to break the end out with a sideward bend. This is best done in the early morning, when the growth is stiff and brittle. Let me not be misunderstood. I do not mean just to break or pull out the point of the growth, but to remove the entire top of the plant with a set of developed leaves intact, so that the remaining eyes are in an equal state of maturity, and all break evenly, and thus we commence with an evenly-balanced plant.

Some growers advocate using a knife for removing the tops, but personally I have always found the growths snap off readily, yet, sooner than pinch them off with the thumb and finger, I should most certainly use a knife.

Montagu C. Allwood.

Rose La France.—There are few varieties that give a better return for a substantial top-dressing of fibrous loam and rotten manure than this. My plan is to carefully remove old surface soil at this season (after removing the winter mulch) down to the roots, and then put on the mixture referred to above. I believe it better to prune lightly than severely, as better results follow. I have never been able to find out what the origin of this rose was, and should be glad if any reader of the Gardeners' Magazine could enlighten me.—Geo. Garner.

THE HART'S-TONGUE FERN.

The Hart's-tongue Fern or Scolopendrium vulgare, is very abundant in many parts of the country, especially in the western counties, where I have met with it in shady Devonian lanes with fronds a yard long, while in the roadside hedges, in company with the Soft Shield Fern (Polystichum angulare), its strongly contrasted translucent green fronds peep out by the thousand on a somewhat smaller scale.

The Hart's-tongue cannot be confounded with any other British fern, since, with the exception of the small and very different looking Adder's-tongue (Ophioglossum vulgatum), it is the only one with quite undivided strap-like fronds. These consist of a stalk carrying a frond usually about two to three inches wide, commencing with two rounded lobes, so as to be heart-shaped at the base, whence it continues as a strap of even width until near the tip, when it gradually narrows to a blunt point. Its colour is dark green, its surface smooth and somewhat shiny, its texture fairly leathery, and its edges quite even.

At the back of the fronds the peculiar fructification of the species is very manifest in the shape of long sausage-shaped spore heaps, an inch or more in length, distributed herring-bone fashion on both sides of the midrib. On close examination these heaps are found to be twin ones, each consisting of two dense rows of spore capsules arranged on forked veins, and in their immature state with a thin transparent skin springing from the outer side of each row and turning inwards as a sort of cover to the spore cases. It is this twinship which distinguishes the Scolopendrium genus from the Aspleniums or Spleenworts, since if we examine the spore heaps of the extremely similar Asplenium nidus, or Bird's Nest Fern, apparently a merely giant form of Hart's-tongue, we see thinner lines arranged in the same manner, but all single and with a cover always on the same side and not on opposite ones.

In districts where this fern is abundant examples are frequently found in which the frond divides at the end into several tips, forming a sort of tassel (Scol. v. lobatum), but this faculty gives a faint, very faint, idea of the sportiveness of the Hart's-tongue. It is, indeed, quite safe to say that no other fern in the world has varied spontaneously into so many diverse forms as this one, even when we consider how some of the other species native to Great Britain have "sported" under wild conditions. Every one of the particular characters we have mentioned has varied not only in one but in many ways. The incipient forking or tasselling of the tip has been exaggerated into broad branching fronds, each branch bearing heavy much-divided tassels, fan-shaped, bunched, lax, rigid, finely divided, roundly lobed, wide, narrow, and, in short, in all conceivable lines of variation culminating in one form which resembles a small, compact ball of moss (S. v. densum Kelway). The normally wide frond has been contracted, and the narrowed portion frilled and fringed, which involves a cutting into segments of the normal smooth edge, or it has been widened and deeply frilled as in the beautiful section of the crispums, of which there are at least a dozen distinct ones, some of them beautifully fringed as well. The heart-shaped basal lobes have been lengthened into pointed barbs, and these again have been expanded into tassels, so that the best forms of this, the sagittate section, resemble a tasselled trident, the lobes being expanded into fronds. The smooth surface has been ridged and roughened and grooved in many ways, both on the upper and under sides. The tip has been abruptly terminated, the midrib projecting as a thorn from a sort of pocket in front or behind according to the variety concerned. Then there are numerous dwarfs spirally twisted and varied in other ways.

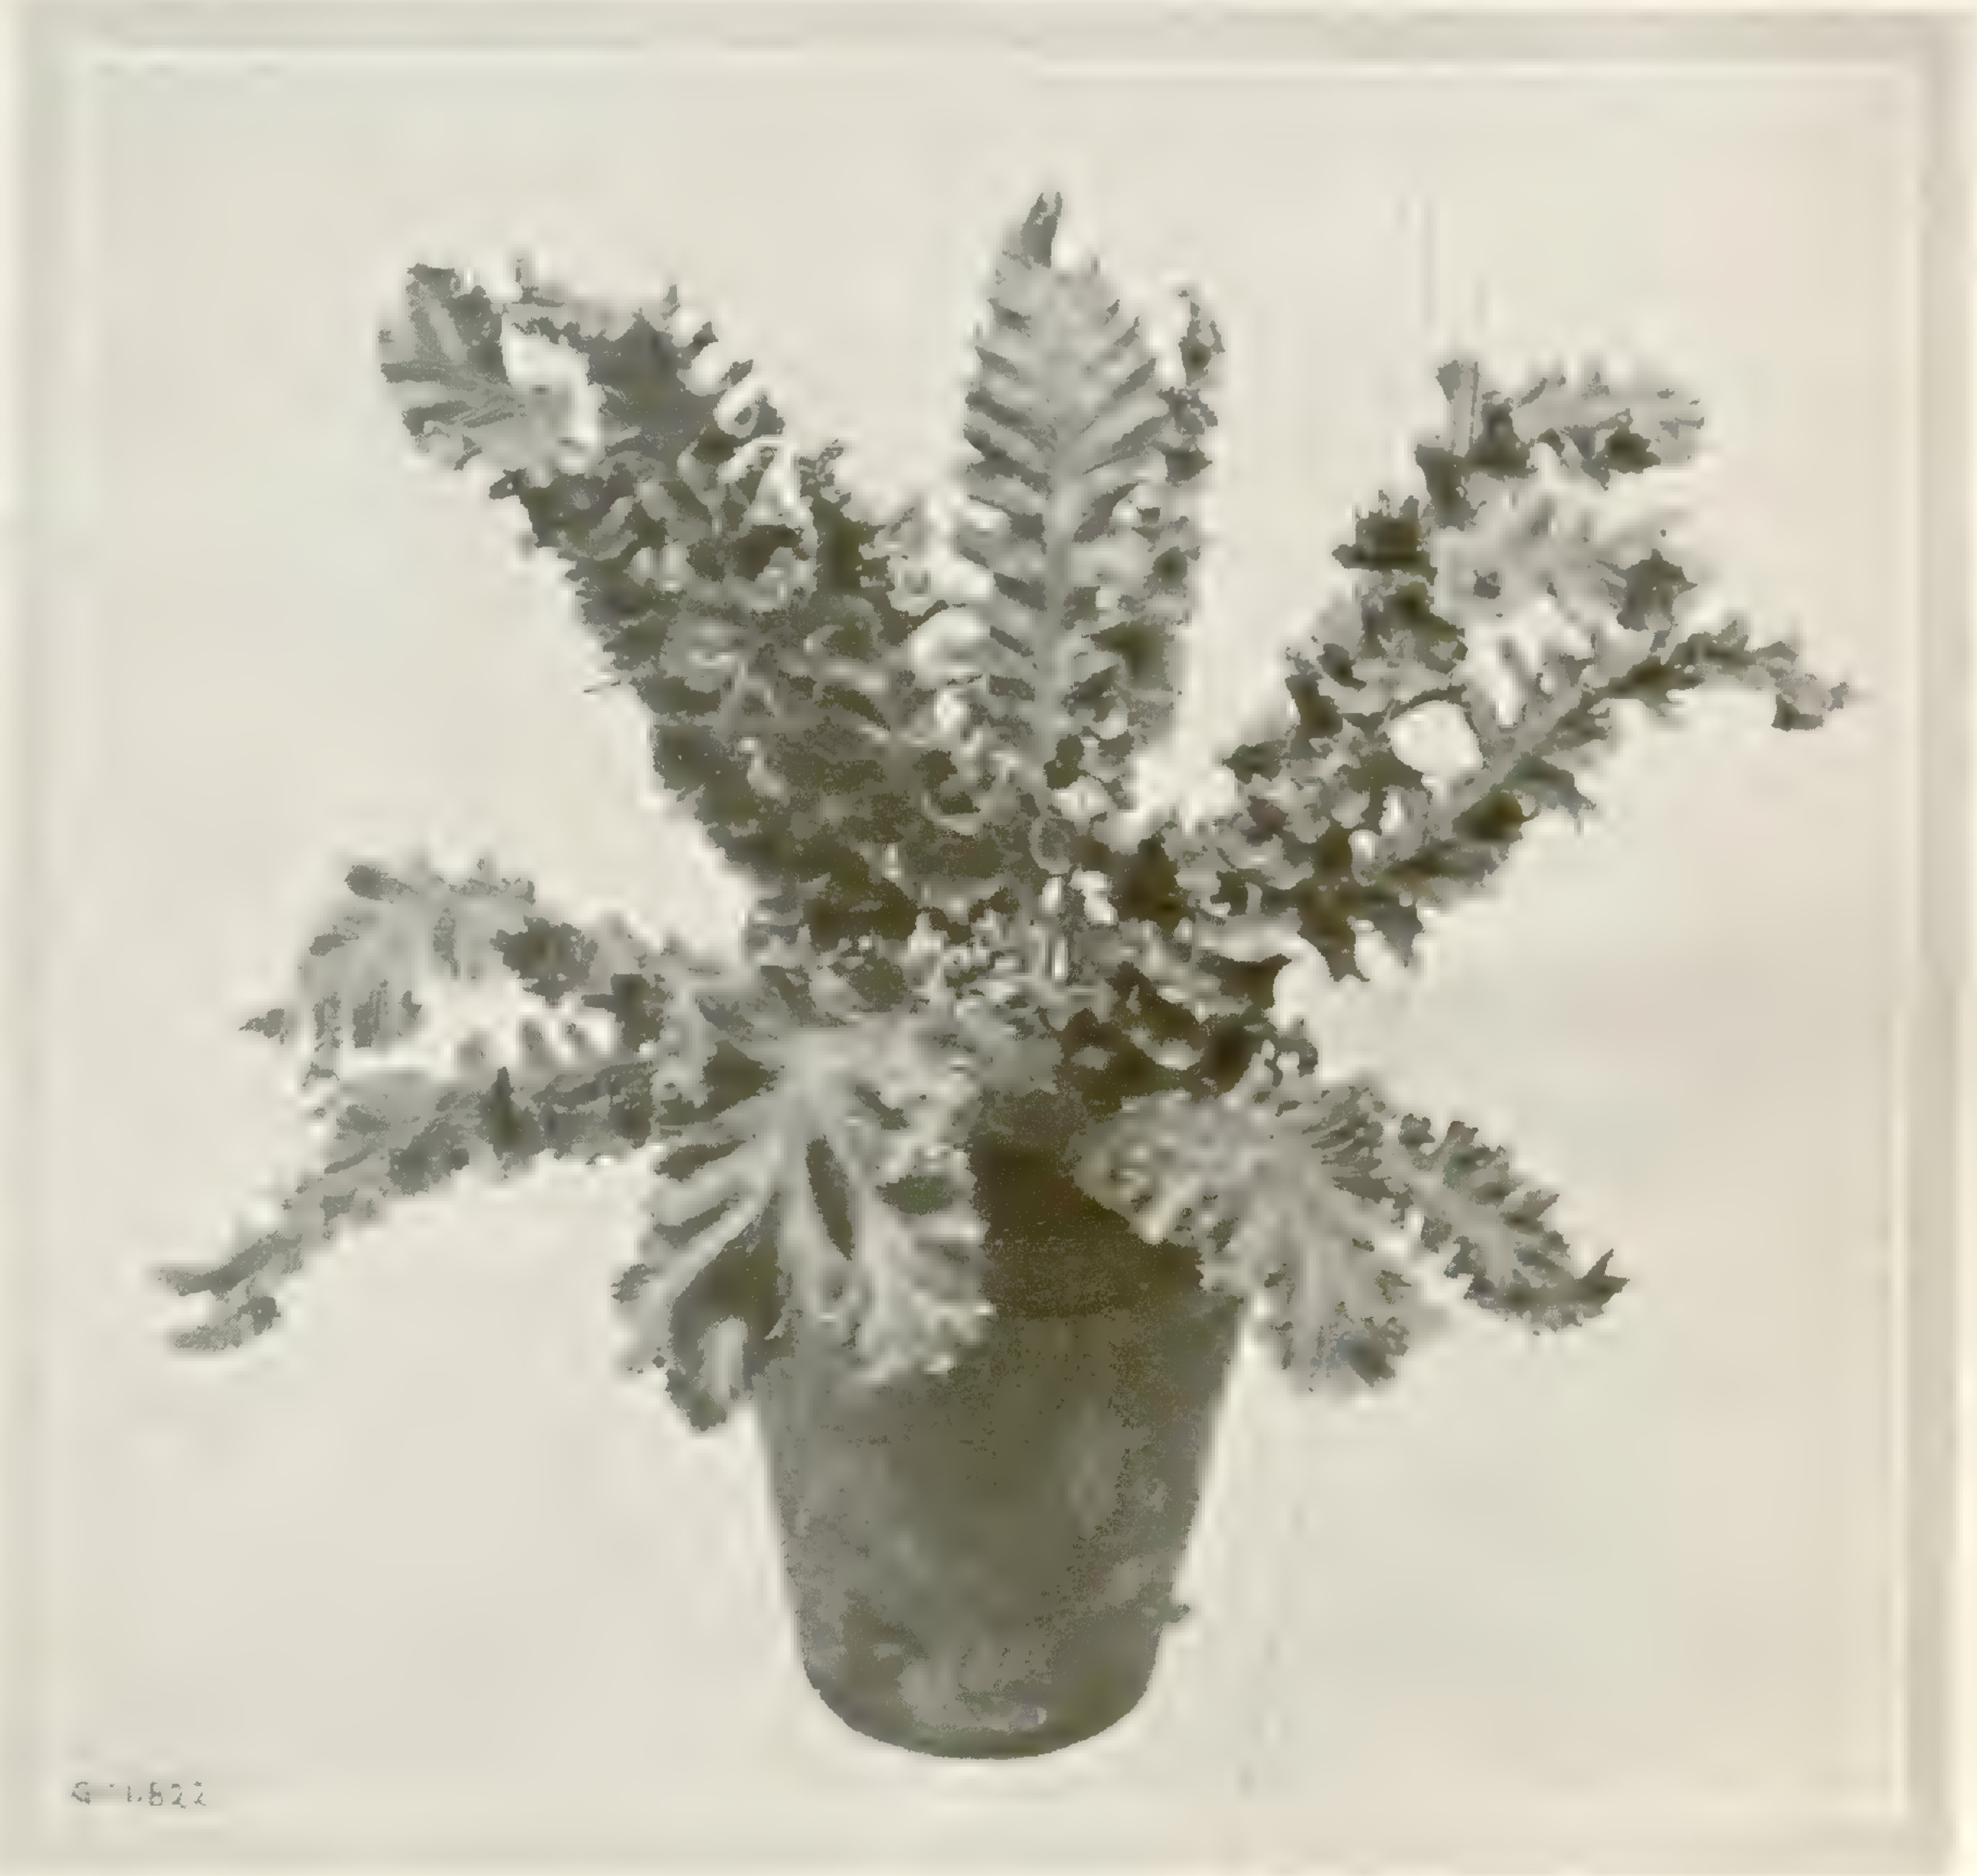
Now, of all these varieties, the types have occurred as spontaneous "sports" among the wild ones. The fern hunter, in his quest examines all he can find, and now and again, perhaps, hidden in a cosy nook in a hedgebank, and only discovered by opening out the enveloping bushes with his stick, or it may be as a diminutive plant on an old wall, a prize of this kind is discovered, usually all alone, and being discovered it is carefully tended, its spores are sown, and in all probability not only is its own particular form multiplied, but variants and improvements, i.e., extensions of type, are obtained. By working on these lines, too, crossing has been found practicable, and many combinations of type have thus been acquired to increase the number, great as it is, which have originated as perfectly wild "sports."

As the Hart's-tongue is quite evergreen, and is not particularly dainty as to soil, doing well in good garden mould, but liking shade and moisture, it is clear that these varieties are well worth growing, and that a collection of Hart's-tongues alone would form a hobby. Beyond a doubt the beautiful frilled or crispum forms are the handsomest. In these the strap-like frond expands on each side of the midrib to such an extent that a regular series of deep folds forms a double frill, which in some forms bears fringed edges as well and even tassels at the tips in addition, with very handsome effect.

Rockwork suits the species well if the compost be fairly free. In this respect, however, the Hart's-tongue is peculiar; it is, indeed, the only British fern which is equally at home under the stunted conditions of a chink in an old stone wall or in a wood in deep leaf-mould on the ground. It is, however, only under the latter conditions that it can develop its full beauty as large robust varieties, but the dwarf forms alluded to would be more at home in chinks of rock work or even in a well-lighted Wardian case.

Having said so much regarding this remarkable fern, remarkable, that is, as regards its varieties, one cannot too strongly counsel readers who only know and grow the common type to obtain a few of those described, and instal them instead, or make pet pot plants of them in cool conservatories, for which they are admirably adapted.

Chas. T. Druery, V.M.H., F.L.S.



SCOLOPENDRIUM VULGARE CRISPUM MURICATO-FIMBRIATUM.

A beautiful hart's-tongue fern recently exhibited by Messrs. H. B. May and Sons, Edmonton (A.M., R.H.S., June 8, 1909), and one that shows how vastly superior the selected varietal forms are over the type.

Peas.—The various sowings that were made in boxes, etc., will be ready for planting out in prepared trenches; plant firmly and evenly, giving each plant ample room. If the weather is dry, give a good watering in, and at the same time stake and protect from cold winds and frosts (that usually occur at this time of the year) with spruce boughs, nets, or other projecting material. To maintain a constant supply, sow weekly in quantity according to the demand.—G. E.

Forsythias.—These shrubs form very striking objects in the garden during the spring months, when they are properly grown. Well-established bushes should be pruned somewhat hard back directly the flowers have faded. A result of the cutting away of the flowering branches will be the early growth of young shoots, which will attain to a good length, be strong, and well matured by the time autumn comes. Such shoots usually bear flower buds nearly their whole length, and, consequently, flower profusely the next spring.—G. B.

NEW PLANTS, ETC.

ODONTOGLOSSUM ARDENTISSIMUM VAR. NORMAN COOKSON.

This remarkably fine odontoglossum was shown in splendid condition, and greatly admired. The flowers are about four inches across, of fine form and substance. The colouring is very rich and bright, reddish-maroon, with a border and small markings of white. The crest is golden-yellow, so that the whole flower is very effective. F.C.C., R.H.S., April 5. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

ODONTOGLOSSUM CERES GOODSON'S VAR.

An interesting hybrid between O. Rolfæ and O. Rossi majus. It mostly resembles the latter parent, but has taller spikes and larger flowers, with red-brown markings on a white ground. A.M., R.H.S., April 5. H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney.

ODONTIODA GOODSONIÆ.
Flowers soft scarlet, edged and marked with buff. A.M., R.H.S., April 5. H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney.

ODONTIODA GOODSONIÆ.

A charming bigeneric hybrid, obtained by crossing Odontoglossum ardentissimum with Cochlioda Noetzliana. The flowers are produced on a small branching spike; they are of medium size, soft scarlet, edged and veined with buff. There were fifteen blooms on the spike shown. A.M., R.H.S. H. S. Goodson, Esq., Fairlawn, Putney.

PHALÆNOPSIS CASTA SUPERBISSIMA.

A fine natural hybrid with bold light pink flowers shaded with mauve purple; lip white and bronzy purple. The parentage is presumed to be P. Schilleriana and P. amabilis, and so the first of these the plant bears the most resemblance. A.M., R.H.S., April 5. Messrs. Sander and Sons, St. Albans.

LONICERA PILEATA.

A very interesting Chinese shrub, apparently of lowly growth. It is perfectly hardy and evergreen. It does not climb as do so many of the honeysuckles, but has a spreading habit, and carries its bright shining green leaves and two regular rows on its branches. The flowers are by no means conspicuous, being small, greenish-yellow, axillary, and pendant, so that the leaves hide them. They are pleasantly fragrant. A.M., R.H.S., April 5. Messrs. Paul and Son, Cheshunt.

CINERARIA FELTHAM BEAUTY.

This particularly elegant cineraria is of dwarf habit, with stellate and yet shapely blooms, borne with the greatest freedom. It is now represented by six distinct shades of colour; i.e., white, pink, light blue, deep blue, carmine, and maroon-purple. A.M., R.H.S., April 5, for the strain. Messrs. Jas. Veitch and Sons, Lim., Chelsea.

CŒLOGYNE MOOREANA.

A beautiful species found by Micholitz in Annam, and introduced by Messrs. Sander and Sons, St. Albans. It flowered in December, 1906, at St. Albans, and in the Glasnevin Botanic Gardens, and was named after the superintendent of the latter establishment, Mr. F. W. Moore. It is closely allied to the beautiful and popular C. cristata, and thrives under conditions that prove successful for the latter. The flowers are large for the genus, pure white, with the interior of the lip almost wholly yellow. Eight is the largest number of flowers yet seen on a spike. "Bot. Mag.," t. 8,297.

LYCASTE SKINNERI HELLEMME'S VAR.

A splendid variety, and of such wonderful colour as to suggest the possibility of it being a natural hybrid. It is of fine size and substance, rich rosy carmine sepals, and brighter and purplish petals, and a lip that is heavily marked with red-purple on a whitish ground. An illustration of this fine lycaste was given in our issue of May 9, page 289. F.C.C., R.H.S., April 5. Lieut.-Colonel G. L. Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

IRIS MINUTA.

A dainty little Japanese iris, with creeping root stock and fibrous roots that develop tiny tubers. The flowerless growths carry leaves eighteen inches long and very narrow. The flowering shoots are only about four or five inches high, and each bears one yellow flower, the falls having deep purple marks. The species flowers in May, and is only known in a cultivated state. "Bot. Mag.," t. 8,293.

AURICULA PHYLLIS DOUGLAS.

One of the finest auriculas ever raised. It has flowers of the largest size and fine form, rich velvety maroon-purple, white, well-defined paste, and bright yellow tube. A.M., R.H.S., April 5. Mr. Jas. Douglas, Great Bookham.

DIPELTA VENTRICOSA.

An interesting hardy shrub from Western China, where it was found by Mr. E. H. Wilson. The flowers bear a resemblance to those of the weigelia, to which genus it is closely allied. The tubular flowers are deep rose-red, the spreading lobes of the mouth being whitish, and the throat orange. A promising addition to flowering shrubs. "Bot. Mag.," t. 8,294.

SYRINGA BRETSCHNEIDERI.

A beautiful lilac that produces splendid panicles of rosy-lilac flowers early in June, after most of the lilacs have passed out of bloom. It is perfectly hardy, and should have a great future among hardy flowering shrubs. It comes from Northern China, and was introduced about 1880. It has been described as a variety of S. Emodi, and also as a variety of S. Josikæa, but is now regarded as a quite distinct species. "Bot. Mag.," t. 8,292.

OURISIA MACROPHYLLA.

A herbaceous perennial from New Zealand. It grows about a foot high, and carries its white flowers in whorls, primula fashion. Probably hardy in the warmer parts of the country. "Bot. Mag.," t. 8,295.

RHODODENDRON KEISKEI.

A densely-branched species from Japan, probably quite hardy, but at present too r to be planted in the open. It has medium-sized flowers in clusters of from three to five, and as these are yellow, the species is of great interest and prospective garden value. "Bot. Mag.," t. 8,300.

CAMPANULA BEAUVERDIANA.

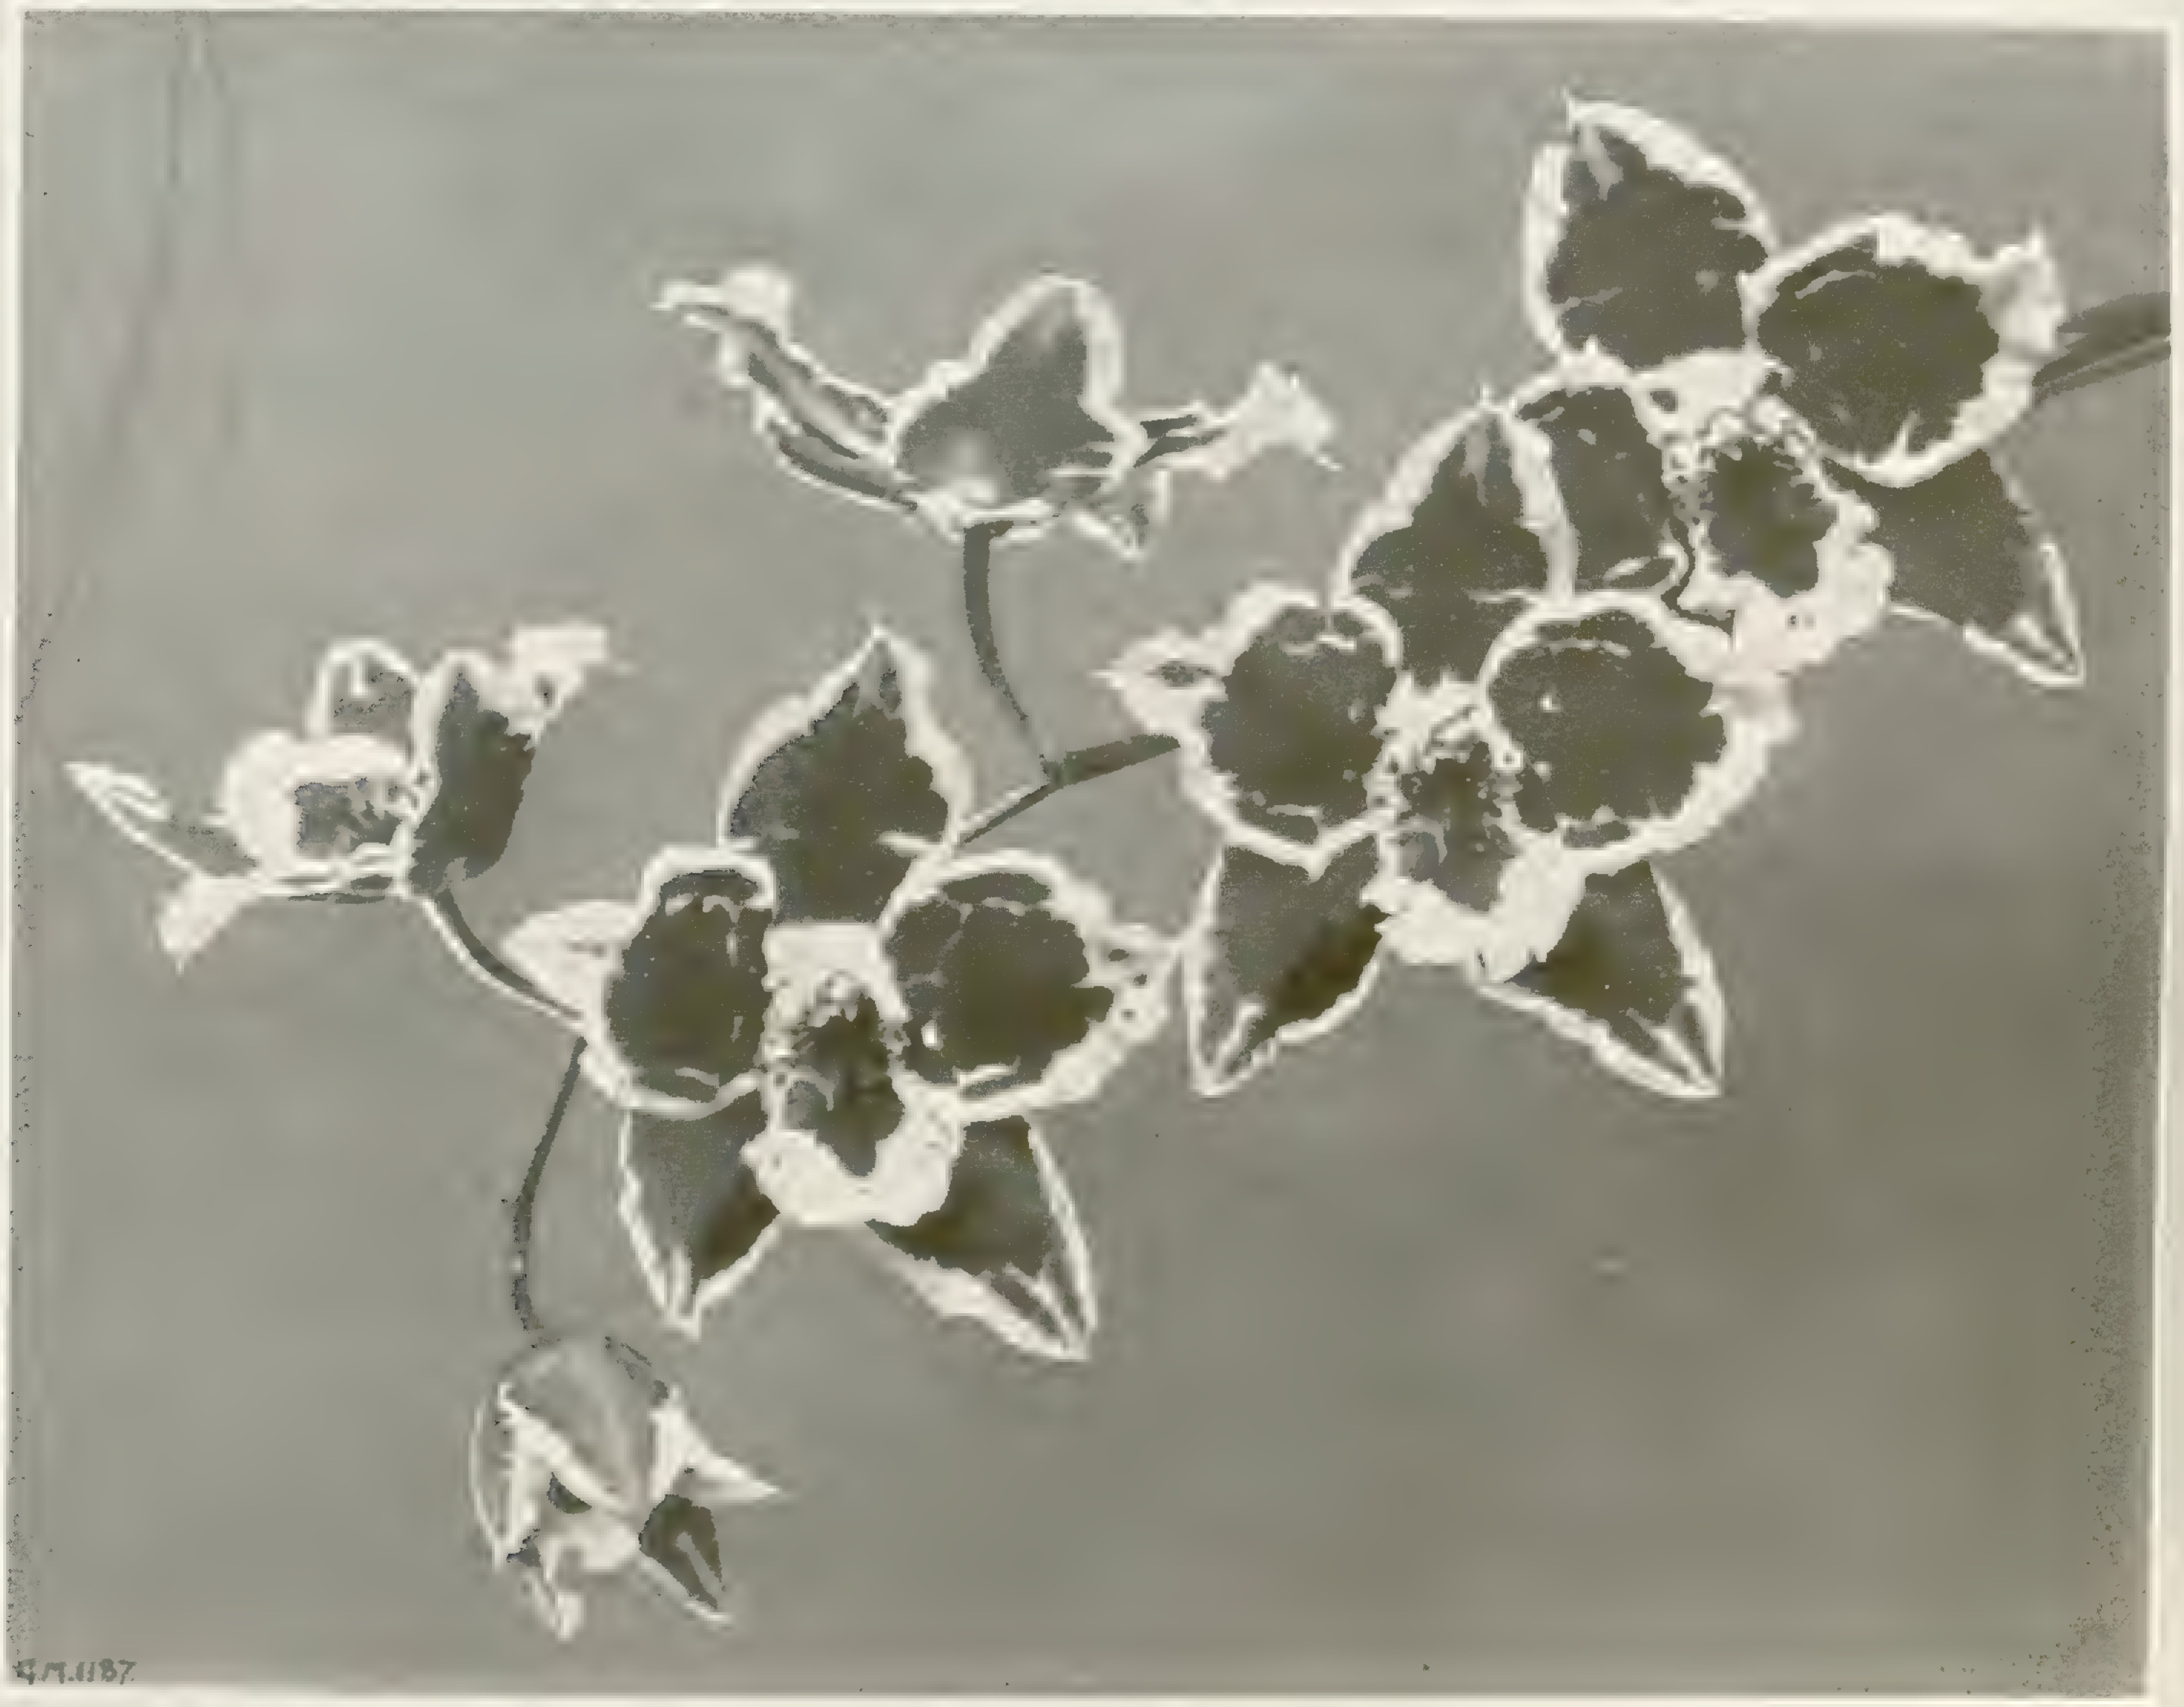
A perennial, hardy species from Northern Persia, with slender erect stems, rising about two feet high. It appears not to be very free-flowering. The bells are about an inch and a quarter across, light blue, and carried on long pedicels. The flowering period is May and June. "Bot. Mag.," t. 8,299.

ERIA RHODOPTERA.

A curious orchid with erect many-flowered racemes of straw-coloured flowers, each having small crimson petals and side lobes to the lip. It is from the Philippine Islands. "Bot. Mag.," t. 8,296.

AGONIS MARGINATA.

This beautiful little shrub from Western Australia is closely allied to the leptospermums, but, unfortunately, it is only hardy in the most favoured parts of the country. It succeeds admirably at Tresco, in the Scilly Isles, where it makes a fair-sized shrub. The leaves are about an inch long, obovate, and greyish green. The tiny, sessile flowers are red-purple, margined with white, and are carried in round clusters in the axils of the leaves, and, as these clusters are very freely produced, the shrub presents a very pretty appearance when in bloom. "Bot. Mag.," t. 8,301.



ODONTOGLOSSUM ARDENTISSIMUM NORMAN COOKSON.

Flowers rich and bright reddish maroon, margined with white. F.C.C., R.H.S., April 5. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

POPULUS NIGRA BETULIFOLIA.

The downy Black Poplar is of uncertain origin, but it is a well-known park tree with a shapely head. It grows up to 85ft. high, has a rugged stem, pubescent twigs, broad rhomboid leaves, and two-inch-long catkins of male flowers, in which the crimson anthers are conspicuous. "Bot. Mag.," t. 8,298.

SOME CONVOLVULUSES.

The name colvolvulus is used amongst gardeners rather to denote flowers of a certain class than as a botanical name, for plants belonging to at least three different genera are included in the term. All are beautiful, and none more so than the Small Bindweed (Convolvulus arvensis), of our cornfields, a thick patch of which emits such a delicious perfume, and Convolvulus sepium (Calystegia sepium) of our hedges, which produces the largest, or nearly the largest, blossom of any wild flower in this country. The name calystegia in Greek denotes a beautiful covering, and well the plant deserves it, and from this point of view it might be applied to the whole class, for there can be few flowers of more perfect shape. Botanically, the main distinction between the convolvulus, and the calystegia consists in the two large green bracts which almost enclose the unopened flowers of the latter, but are totally absent from the former.

The great white bindweed is a beautiful adornment to our hedges, but we cannot admit it into the garden for reasons known to everyone. The plant we will first consider is the great single pink flower sometimes called Calystegia rosea, and sometimes C. sepium rosea. There is scarcely any limit to its growth, either above or below ground, though it is very much easier to get rid of than the wild form. I have grown it in the garden for many years, and should be sorry to be without it, the clusters of its large flowers, on an arch, fence, arbour, or what not, being well worth the little trouble of keeping it in bounds. It should not be planted within reach of cultivated ground, but in odd corners or places where it is bounded by walls or gravel paths, so that it cannot spread unduly. Then it is a valuable garden climber, and when it can be said that it is quite hardy, never dies out or needs replanting, flowers from June to September, and is beautiful withal, that surely should be enough to atone for the rampancy of root which has made it so many enemies.

A plant which is generally included in nurserymen's catalogues, while the last-named is omitted as a pestilent weed, is Calystegia pubescens (syn. hederacea) flore pleno, the double Chinese bindweed. It is useful for covering trellis or rustic work of any sort, growing to the height of six feet or so, and producing a profusion of double pink flowers from June to September, while in general growth and appearance it bears some resemblance to the single pink one above referred to, except that to lovers of the form of the single flower these double flowers are less beautiful. It spreads at the root, but is not likely to become a nuisance, unless amid very favourable surroundings, as it requires a warm soil and situation to do really well, being rather weedy in appearance in a cold wet soil. Well grown it is not without beauty, which is enhanced, however, when it is a little distance from the observer.

Leaving these perennial forms, there are two annual ones which most have grown at some time or other. One is the Morning Glory, known as Convolvulus major, or Ipomœa purpurea. It will grow in any ordinary garden soil if not too dry, and in any aspect, but it pays for pretty good conditions, as it is never rampant, rarely exceeding six feet in height. It is best grown where the sun does not reach it much before midday, for if it gets the early morning sun its flowers may be beginning to fade by breakfast time. It is a tender plant, coming from Tropical America, and, though in light soils and warm situations it may be sown in the open late in April or early in May, it is, as a rule, best sown in sixties, a half-dozen in a pot, and turned out whole, when all danger of frost is over. It may be used for a variety of purposes—running over perennials like delphiniums, tall thalictrums, and other subjects which flower early in the summer, small-leaved shrubs, or tall sticks, in the flower borders, or elsewhere. There is an ivy-leaved form of it known as C. hederacea.

The last to be mentioned here—though there are many more—is Convolvulus tricolor, more often known as C. minor, a showy annual for beds and borders, growing a foot or more in height. It needs pretty good cultivation, and full sunshine, if it is to do really well, when it lasts in flower for a long time, the colours being somewhat similar to those of C. major. It is, however, one of those annuals which are sometimes ruined for the season by a July thunderstorm, and unless its growth is pretty sturdy is apt to go down in an ordinary rain when in flower. Still, it makes a very gorgeous patch of colour.

Alger Petts.

COLOUR IN PEACHES.

A highly-coloured peach is certainly more attractive than one with a dull or pale-coloured skin, although some varieties have naturally rather pale-coloured skins, and yet their flesh is delicious and melting.

I am not, however, specially referring to the latter in this note, but to those varieties that have a very rich colour naturally, when well grown, such, for instance, as Royal George. Now, I am well aware that some inexperienced cultivators think that they need only expose the fruits to the full light and sunshine a few weeks prior to their ripening. I have seen this done with disastrous results. The fruits, being nearly hidden under a mass of leaves were suddenly exposed to the full light and sunshine, and in a few days the exposed sides were scalded and the fruits spoiled. This does not always happen in such circumstances, but it is the wrong way to secure richly-coloured peaches.

I believe in the full exposure of all fruits to the light and sunshine, if possible, from the moment they are "set," and I do not hesitate to remove odd leaves with that object in view. The young fruits, when about the size of ordinary marbles, should be quite brown in colour; and, owing to the long exposure, I find that such specimens are generally well coloured on all sides by the time they are ripe enough to gather. Owing to the early and prolonged exposure there is not the slightest risk of the skins being scalded, and the richness of the colouring when the peaches are ripe is vastly superior to that resulting from late and sudden exposure.

Of course, the way in which the trees are trained has a bearing upon the facility with which full exposure can be accomplished; but, as a rule, there is not much difficulty in the matter, and if the exposure of the fruits be done thus early, the work can be more easily carried out than later in the season.

George Garner.

SOME GOOD OLD ROSES.

Eulogies of roses of recent introduction are numerous, but there are many grand old varieties that have stood the test and competition of years, and are so well known that little fresh can be recorded of them.

It occurs to me, however, that a few words upon some varieties that have been in cultivation for forty years and upwards may be of interest, and they deserve a little notice after so many years, as well as the unknown and too often disappointing newcomers.

To take the class or section of hybrid perpetuals first, can we find better crimson roses than Alfred Colomb, Camille Bernardin, Comte Raimbaud, Doctor Andry, Duke of Edinburgh, General Jacqueminot, Duke of Wellington, Madame Victor Verdier, Maurice Bernardin, Senateur Vaisse, Marie Baumann, and Marechal Vaillant? Really good deep crimson and maroon varieties can be had in Charles Lefebvre, Fisher Holmes, Xavier Olibo, Louis Van Houtte, and Monsieur Boncenne. Prince Camille de Rohan is one of the darkest and most reliable roses even after forty-nine years, and surely deserves attention drawn to it as much as many of the doubtful newcomers.

Then we have few more reliable roses than Dupuy Jamain, Baroness Rothschild, Beauty of Waltham, and Countess of Oxford; while if one requires size, Paul Neyron would be difficult to beat. Both General Jacqueminot and Jules Margottin have been with us for fifty-seven years. How many hundreds of varieties of the same colours, and reputed improvements upon these old friends, have flashed for a time, and are now utterly lost!

Turning to the teas and noisettes, we still cannot dispense with Safrano (1839), or its two offshoots in Madame Falcot (1858), and Madame Charles (1864). Devoniensis (1838), Niphetos (1844), and Aimée Vibert (1828), are still among the best whites in this class. Gloire de Dijon, still one of the most useful roses in the open, came out in 1853, and the unapproachable yellow in Maréchal Niel is but a decade younger. Catherine Mermet, Souvenir d'un Ami, Souvenir d'Elise Vardon, Madame Bravy, Rubens, and Rêve d'Or are all tried varieties of more than forty years' standing. The hybrid tea class is too new to have many examples, but we can claim La France (1867).

If we want hardy roses they are very naturally found among these ancients, and have stood the test of many seasons. Félicité Perpétue (1828), Souvenir de la Malmaison (1843), Amadis (1829), Madame Plantier (1835), and Homere (1859), are only a few that cross my mind. But, of course, most of them are naturally hardy, or they would not have stood so long. Fortune's Yellow, Maréchal Niel, Niphetos, Lamarque, and the two Banksians are certainly tender, but none the less indispensable in their peculiar and happy spots.

The damasks, mosses, and Chinas have very old representatives, but to name more varieties might prove tedious. What I wished was to pay a little well-deserved praise to tried favourites, and not give all the attention to newer roses.

A. P.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post in box 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CARNATION CULTURE IN AMERICA.

(Concluded from page 294.)

◆

Wanted—A Soil Carrier.

If there is any time in the year when the greenhouse labourer approaches mutiny, it is when the task of wheeling out and wheeling in presents itself. If, at this particular period of carnation culture, the lady who strolls through the houses in the winter, remarking on the delights of "cultivating the fragrant blossoms," comes around once more, she certainly finds herself rudely disillusioned, for it is as hard, hot, and disagreeable as working in a quarry or in the moulding room of an iron mill. The man who perfects a practical mechanical soil carrier, not only has a fortune assured, but the added blessing of every man relieved of this arduous and exhausting work.

A word as to soil: The old prescription, "Three parts of soil to one of well-rotted manure, together with a generous sprinkling of bone, chopped fine and put on the benches," is sure to be superseded by more modern methods of soil preparation. There are a number of eminently successful firms in this country that take as long as five years in the preparation of their soil for indoor culture.

The one vital principle to be observed is to have the manure and other fertilisers so thoroughly assimilated by the soil, by means of leguminous crops and clovers, that the food is immediately available to the plant.

Back to the House.

So much has been written concerning the careful lifting and quick resetting of the plants from the field, that I pass this item of culture, but wish to emphasise the necessity of the use of the Bordeaux mixture promptly on the establishment of the plants. Generously applied, and given once thereafter every three or four weeks, it not only acts as a preventive of spot, rust, and other minor diseases, but of stem-rot as well.

By beginning in August with a weekly spray of Nicoticide and continuing throughout the year, we keep down aphis and also rid our plants of thrips. Red spider is controlled by an occasional application of salt water, together with syringing under high pressure on bright days.

The antiquated proceeding of mulching heavily in late summer or autumn has given way to light top-dressings, through which the surface of the soil is always pliable and open to the free air, thus preventing any tendency towards souring.

Lime, wood ashes, sheep manure, and pulverised cattle manure, always applied sparingly, constitute the menu for our plants after they are "up and doing."

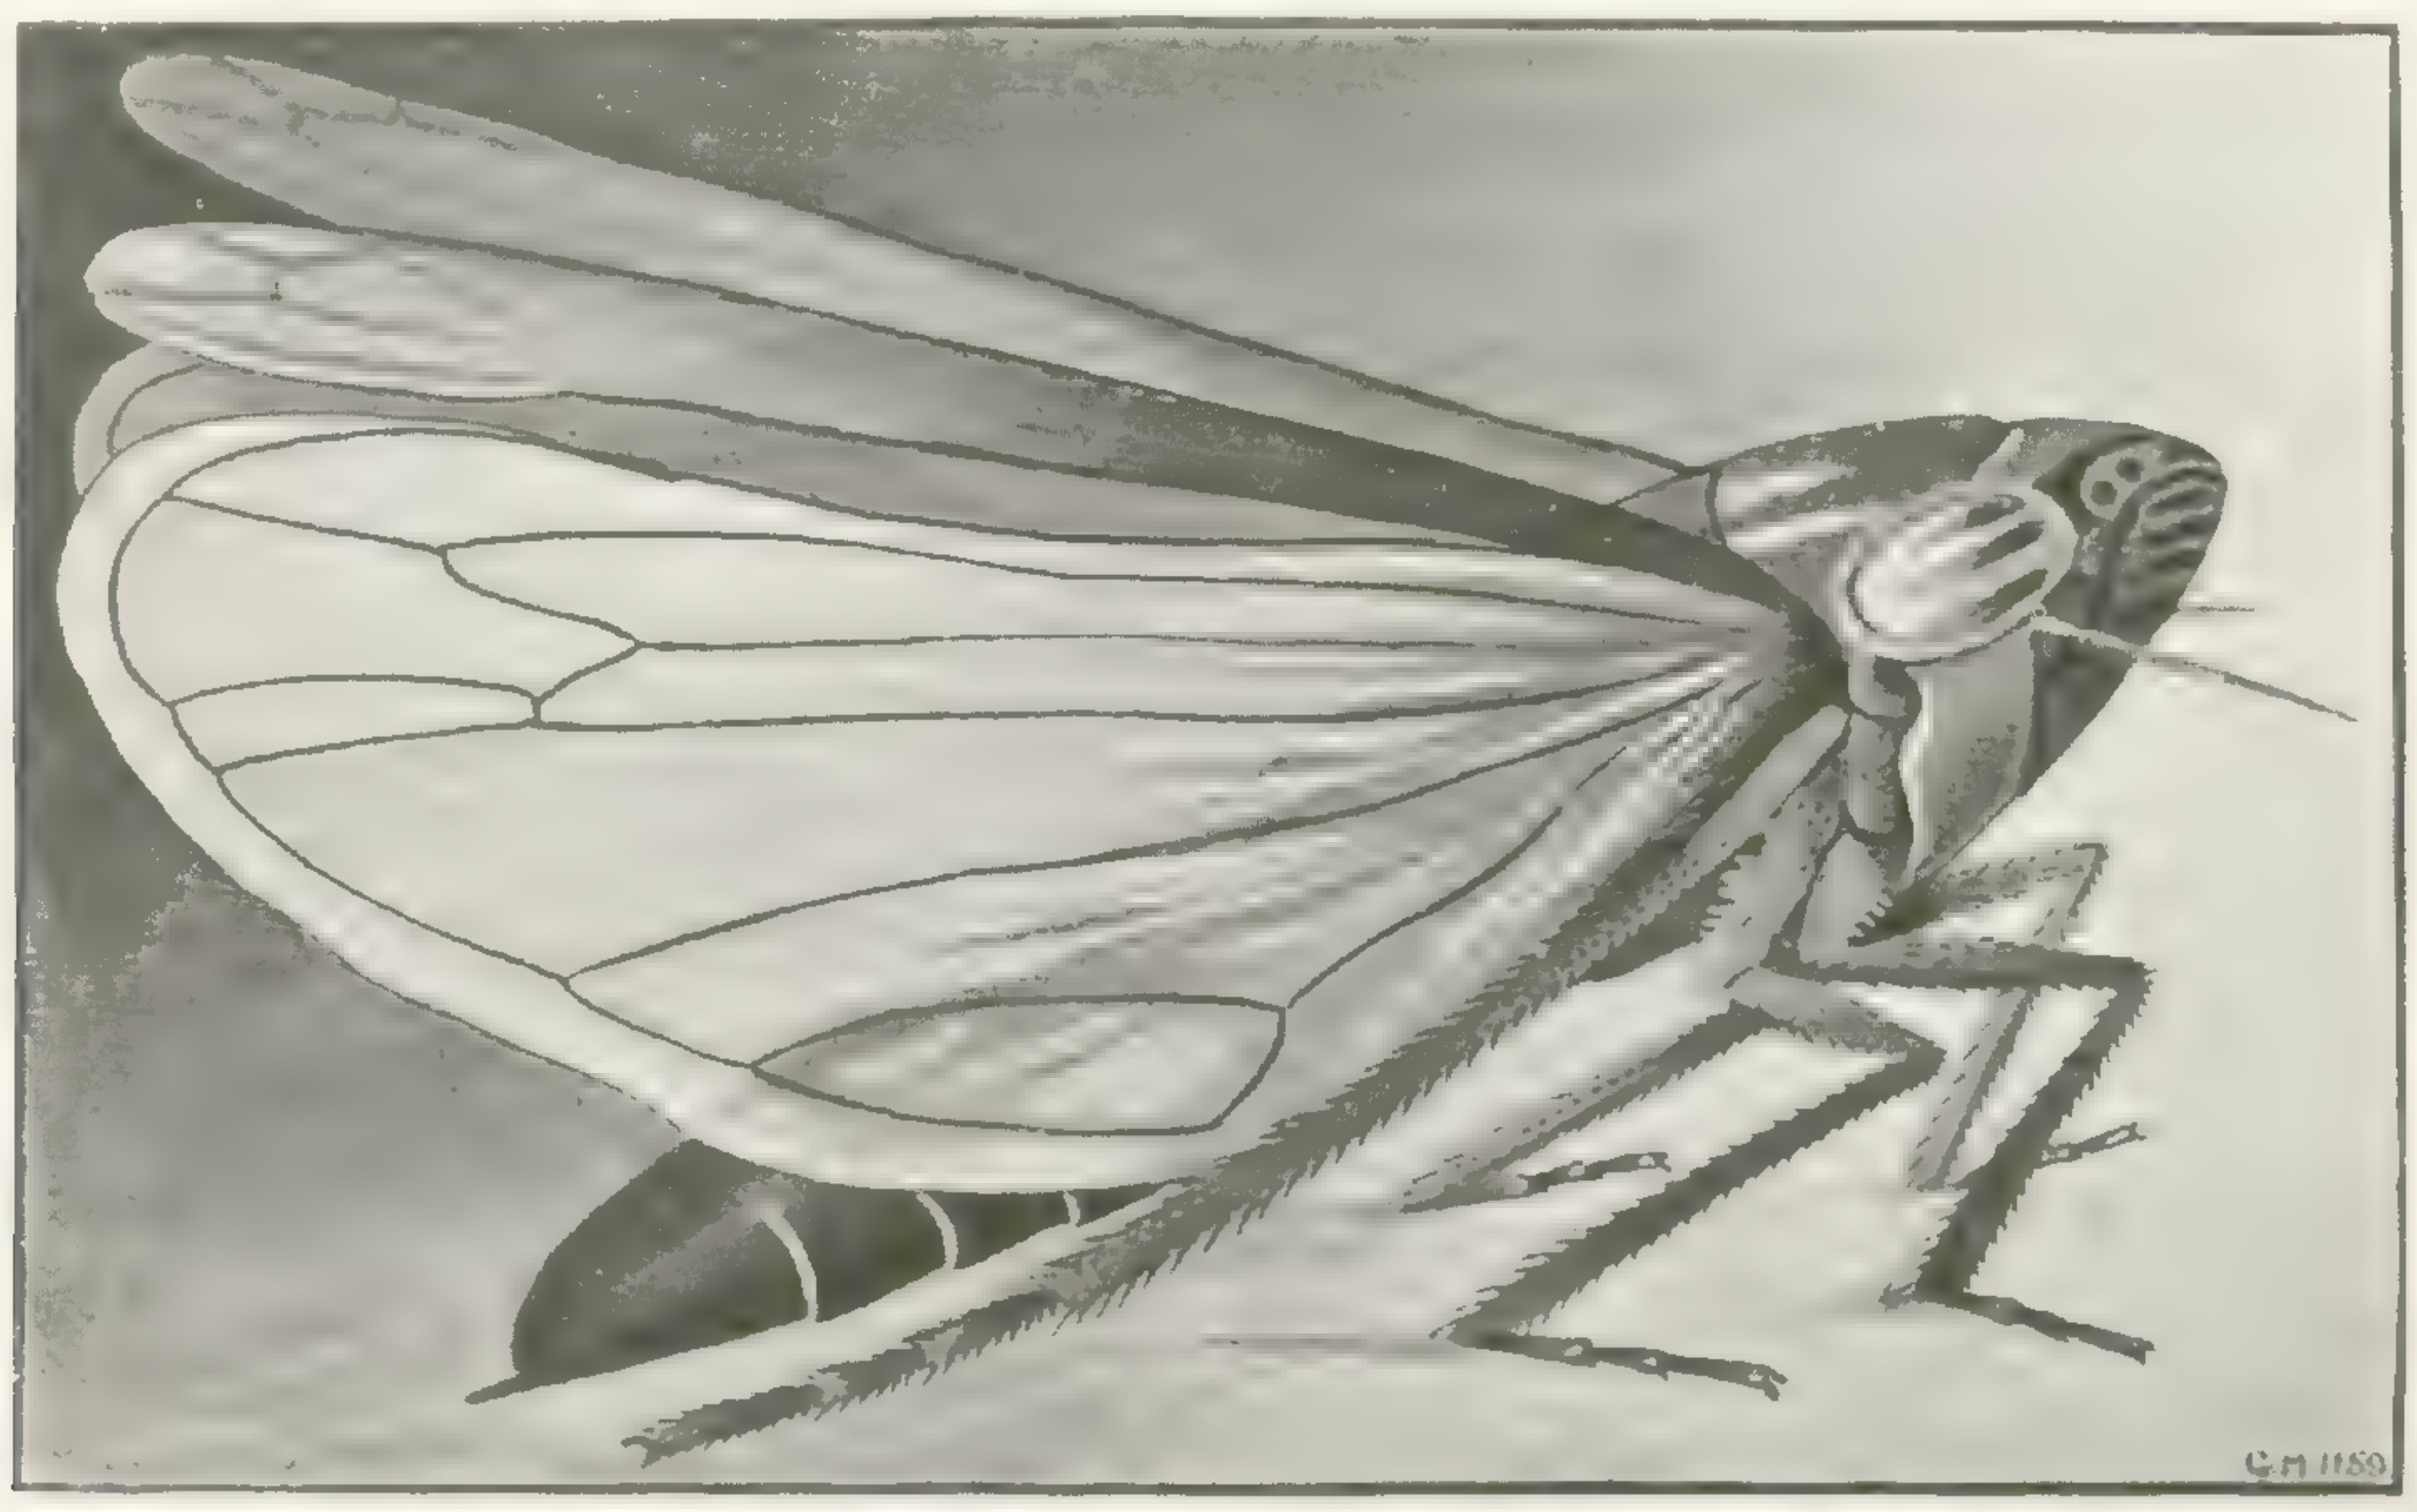
Plenty of fresh air, whenever it is possible to admit it, insures a healthy, free-growing plant.

Not until October and November do the plants throw characteristic blooms, but if by January 1 each plant does not show several blooms cut, something is decidedly wrong either with the variety or with the culture given.

In regard to new varieties: We need them and they are interesting, and we must not forget that every variety that we grow was once an untried novelty; but it behoves every general grower to ascertain, as far as possible, the exact value of a new one before displacing an old one to make room for it in quantity. This national meeting is of inestimable value to carnation growers, in that it shows just how well the standard varieties are holding their early vitality and positions, and just what new sorts are surpassing their seniors in brilliance of colour, perfection of form and in size. Only the finest and most productive sorts can in this day and time pay for standing room in the modern, up-to-date greenhouse.

THE CUCKOO SPIT AND FROGHOPPER.

The cuckoo spit is one of those obstinate insects which have succeeded fairly well in defying the attacks of the gardener, whose intended remedies do not appear to inflict sufficiently drastic punishment upon it. But even enemies may sometimes prove interesting, when studied in a proper spirit, and I therefore propose to acquaint the reader with a few curious facts concerning this one, and add some suggestions for its destruction.



FROGHOPPER OR CUCKOO SPIT.
Perfect insect, with the covers raised edgeways and the wings expanded.

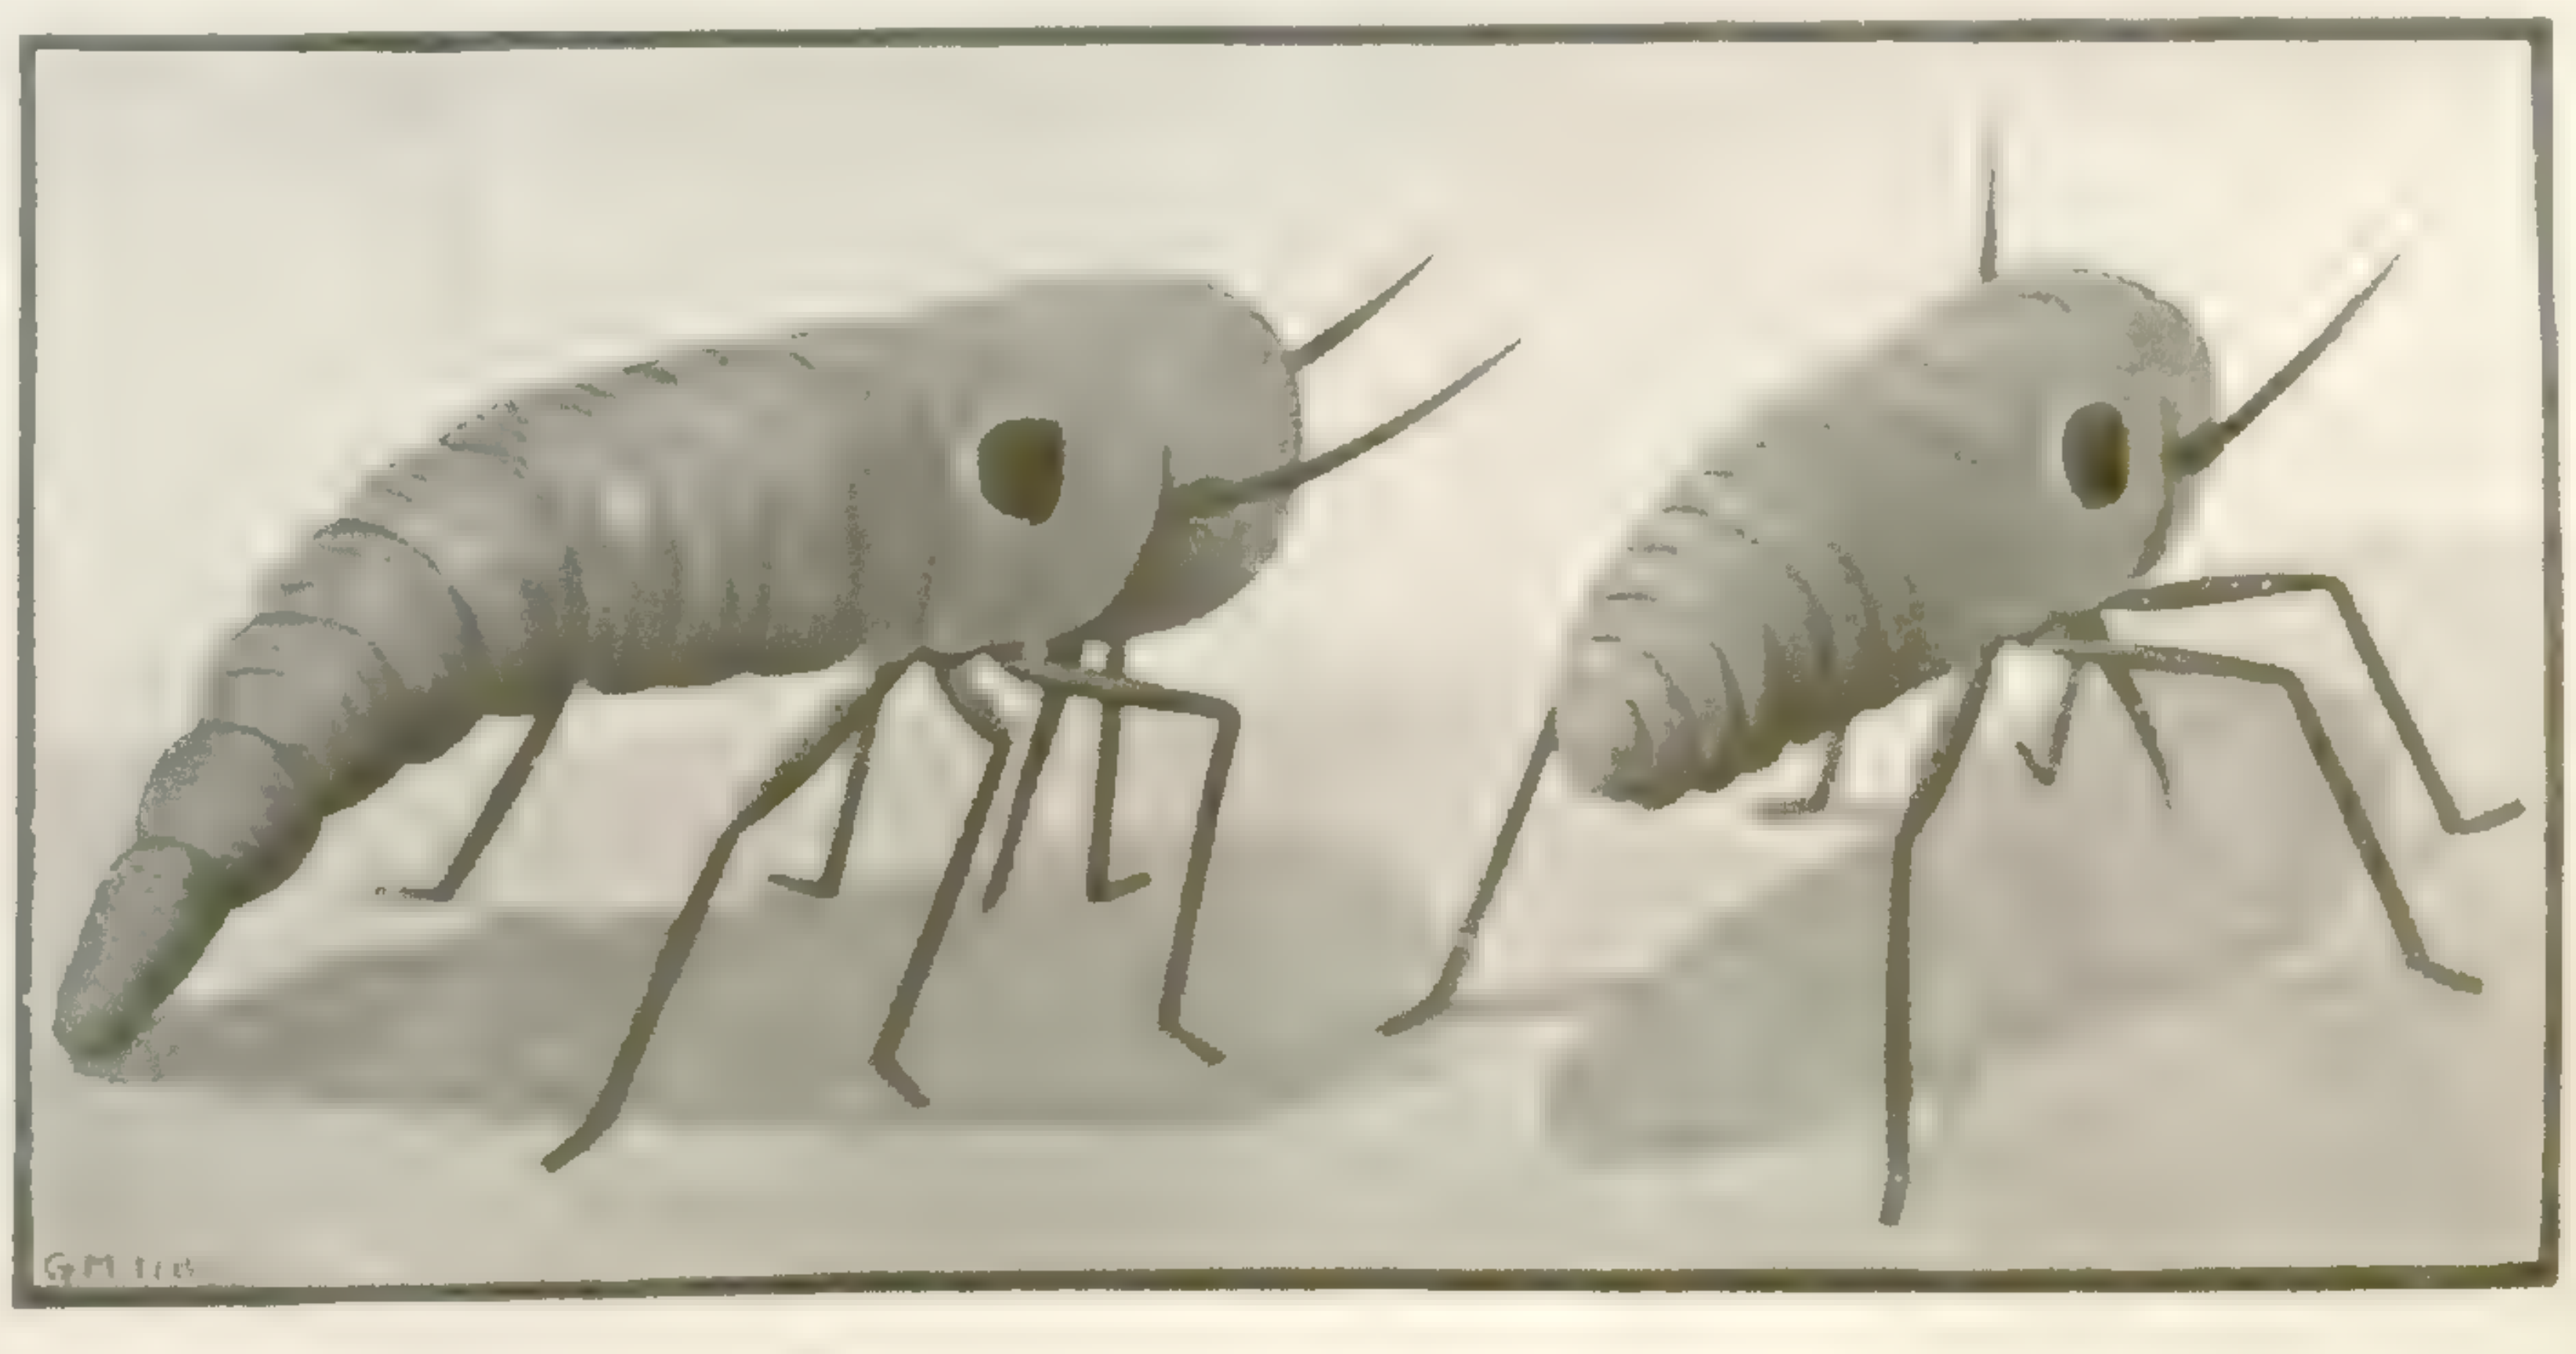
The most unobservant person cannot fail to have been struck with the frequent presence on many plants of a frothy substance resembling saliva. The remarkable likeness to that product has been responsible for leading many people to regard it as the exuvia of some large creature. Anyone who will trouble to probe into a mass of the froth will soon become aware of the presence therein of a tiny pale green creature of very quaint shape, as may be readily conceived by referring to the illustration, where a couple of magnified specimens are depicted in different phases of contortion. Most gardeners are, I am sure, familiar with this tiresome pest, much to their chagrin and disgust.

In my repeated examinations, covering a long period, of both plants procured from gardens and from fields and hedgerows, I have been made aware that the pests abound to a greater extent in uncultivated spaces.

Exactly the means by which the peculiar and really sickly-looking stuff in which they are nearly always embedded is produced, was a matter savouring more of conjecture than certainty (resembling other features of insect life in this respect), but I may mention that my observations reveal the fact that during its production the tail portion of the insect is thrust in and out violently, and waved about meanwhile, with an obvious deliberation. I will return to this point later on. Beneath the microscope the substance, as it lies on leaves, appears to be a collection of bubbles, and it undoubtedly serves as an effectual protection for its occupant, both in the direction of concealment and as a deterrent against the carnivorous attacks of larger foes. It is also permissible to surmise that it secures the creature against the scorching effects of the sun's rays and the rain.

I daresay that my readers will be aware that the quaint beings are called cuckoo spits, in allusion to a most outrageous belief that the particular bird mentioned is responsible for their appearance.

In pursuit of the remarkble truth concerning the production of the mysterious substance in which the insects willingly bury themselves, I have watched numbers of cuckoo spits which I have freed from the contact of their exuvia. After my examinations I arrive at the conclusion that the evolution of the material is analogous to the creation of honeydew by aphides, and of silk threads by spiders. My captives have wobbled about indecisively for awhile, as though bewildered by their nakedness and exposure, until at last they have displayed an anxiety for concealment. I have observed that preparatory to entire seclusion they secrete from the hinder portion of their bodies a soft jellified substance, in the form of threads, very greatly resembling those of a spider, which, however, increases in thickness until it may be called a stream. The insect thrusts out its telescopic and flexible tail until it touches some adjacent spot, and then withdraws it, a slender thread issuing therefrom as an immediate result of the action. Repetitions of the movements produce, as I have stated, thick streams of matter, the creature meanwhile shifting its position. After awhile so much of it accumulates as to afford a safe retreat into which the insect may penetrate until no part of its body is visible, and the matter gradually assumes the form already described, viz., that of a mass of bubbles. The production of soap lather may be taken as a somewhat similar process, except for the fact that the insect's material is at first drawn forth as threads of slime. Just as stirring a mass of soapy water will cause it to become a heap of bubbles, so the exertions of the secreting insect gives rise to a similar effect. The illustration will considerably facilitate a proper comprehension of these facts, since the contortions practised by the creatures during the performance are there pictured.



IMMATURE FROGHOPPERS OR CUCKOO SPITS.
The frothy white substance on the leaves of plants is produced by the insect in its immature stage.

It is destined to undergo a curious transformation when fully grown, developing into that insect known as the froghopper, which looks ludicrously like a miniature frog, both in regard to general contour and attitude, though it has six legs, which possess no possible analogy to those of its namesake, except that of permitting their owner to spring.

The commonest and most conspicuous kinds of froghoppers are dark brown, bright green, and yellow respectively, and it is the former which I have selected for illustration and mention. There is, however, very little difference between them. Apart from colour and trivialities of structure, which would appeal exclusively to the student, each is furnished with a pair of strongly ribbed wing cases, clasping the body like the sloping covers of a book, and beneath them are folded a pair of transparent and very delicate wings, which it would be excusable to suppose were hardly suitable for flight. Yet such is not the case.

It will be seen from an inspection of the second illustration that the forepart of a froghopper has the aspect of a fish-head, its peculiarly striped large eyes tending to accelerate the grotesque likeness. This creature is not provided, however, with a true mouth, but has, instead, a piercer (not dissimilar to those belonging to the bug and the aphis), which is normally pressed against its breast, and becomes, as a consequence, an inconspicuous feature unless deliberately shifted by the observer.

In the drawings the hind legs are shown contracted as they would be preparatory to the insect taking a leap, so that although the portions exhibited are very long (extending from just behind the eye), there still remains much of each limb out of sight, as it were. The extremity of the froghopper's body is supplied with a remarkable contrivance which it is not alone in possessing, viz., a set of saws, by the use of which it is enabled to neatly gash the tissues of a plant, afterwards laying its eggs into the severed portions for security. The saws are embraced by a couple of similar, though coarser adjuncts, and the whole four together comprise the extremely serviceable tool which is protrusible from the abdomen. It can be thrust in and out with incredible alacrity, often requiring a keenness of vision to observe its movements.

In cutting a leaf the froghopper protrudes its contrivance, and so disposes of it that the toothed edges of the saws are free from all direct contact with the remaining portions. Then the saws travel quickly backwards and forwards, being held meanwhile securely along their top ridges within corresponding grooves on the claspers. When a suitable cut has been accomplished, the whole four blades are so arranged as to form a tube, and along this the eggs travel successively, falling into the cavity, or cavities, provided for their reception, whence, in a short time, under favourable conditions, will issue the funny little living things portrayed.

It is necessary to state that when a cuckoo spit is freed from the confinement of its exuvia it rambles along with its collapsible tail elevated high in the air, presenting meanwhile a most grotesque appearance, and it is only when seeking to prepare its concealing slime that it lowers that part in the manner illustrated.

The appellation cuckoo spit must have been gained from an interesting and inexplicable misapprehension. The term so common among country folk, who, when they refer to the likeness a child bears to either of its parents, often remark that it is the "spit" of the father or mother—as the case may be—seems to point to the supposition that saliva has creative properties, or, at any rate, contains a germ capable of giving rise to a living creature. I am not aware of the origin of the expression, but I mention it because it must have been responsible for the existence of the name applied to this curious insect. Early observers, who possessed no means of making a proper acquaintance with the features of the natural history of minute forms of life, must have been puzzled concerning the production of the saliva as they wrongly considered it and so comfortably and conveniently asserted that that deservedly abused bird, the cuckoo, discharged it from its mouth, and that the queer creature embedded in the substance would, in due course, become converted into a young cuckoo! The fact that the cuckoo never built a nest, while young birds of this species certainly did appear in the right season, undoubtedly aided the supposition.

The spraying of insecticides does not effect much result upon the cuckoo spits, unless they happen to be free from their exuvia, as sometimes happens, and the only remedy applicable is to pinch the substance and its contents, thus destroying the objectionable intruder. This, of course, would entail a large amount of trouble in making examination of plants, but as the pests are never so numerous as aphides, this process must not be grumbled at. I have found that a puff or two of tobacco smoke from a pipe will render the creature helpless, and frequently destroy it when removed from its shelter. There again the difficulty is to apply the remedy. Encourage ladybirds and spiders in infested gardens. These should never be destroyed unless their numbers are intolerable. They do not injure plants in any way. You must not confound mites with spiders in bearing these notes in mind, since they are decidedly destructive, and are sometimes misnamed "spiders." The "red spider" is an instance. It is really a mite.

With regard to the extermination of the adults, or froghoppers, undried tarred boards should be placed around or underneath the infested plants, and the insects disturbed, if possible, by the liberal use of a dusting brush. As they favour hopping more frequently than flying, such a process will result in the deposition of many of them upon the boards, when they can be easily destroyed. Even where no signs of insect presence is observable, it is a useful pursuit to allow newly-tarred boards to remain out on the ground, or propped up in corners, all night.

Remember that for every froghopper there may afterwards appear a very large number of cuckoo spits.

James Scott.

ORNAMENTAL GOURDS.

Climbers of annual duration add considerably to the interest and enjoyment of a garden during summer, and although the principal feature of interest lies in the majority of instances in the flowers, there are a notable few which are employed for their attractive foliage, and yet another section is admired for the ornamental character of its fruits.

To this latter class belong the ornamental gourds, whose vigorous growth proclaims them as being pre-eminently adapted for producing a screen or for quickly covering undesirable features, while the bold outline of the leaves forming as they do a pleasing contrast to the brightly-coloured and quaintly formed fruits, makes them novel features for covering such structures as pergolas, or light trellis work. The rapidity of gourd growth is proverbial, and the month of June being generally considered quite soon enough for planting in the open with safety, it is therefore a wise policy not to start the seed too early, otherwise the plants are starved before planting out. The end of April is a suitable time for making a start, and the seeds should be put singly in small pots containing light, rich soil, and in a gentle heat. Germination takes place in a few days, and as the plants rapidly fill their pots with roots, care must be taken to give a shift into larger pots before they become root bound, and by encouraging free and uninterrupted growth and with subsequent care in hardening off, they readily take to their summer quarters without any appreciable check.

Trained to vertical poles they are the most effective for the display of their fruits, but in this system all laterals require stopping beyond the first fruit formed, as the minimum crop is thus secured. When employed as a screen upon trellis work, it is generally necessary to encourage a definite number of these lateral shoots, and to this end, the lead should have the point pinched out when the main shoot has attained the desired height.

Gourds delight in a light, rich soil, consisting of equal parts of loam, leaf-soil, and well-decayed manure, and during the summer months frequent supplies of water with the drainings of the cow-house, or some approved fertiliser, applied at frequent intervals, promotes luxuriant growth and materially assists in the development of the fruits, while it often prevents the plants from an attack of mildew to which the foliage is very susceptible in periods of drought.

English trade growers supply seeds of these ornamental gourds in mixture, though a few offer them in collections of distinct varieties; on the whole, it is immaterial how purchased as a sufficient number of varieties are ensured by either system, and as the English names are nearly always descriptive it is unnecessary to detail a list here.

Thomas Smith.

Walmsgate Gardens.

WATERSIDE LOBELIAS.

The rapid spread of waterside gardening has brought many sterling groups of plants into greater prominence, and among these one notes the tall, moisture-loving lobelias. In the past lobelia culture has hinged chiefly upon L. erinus and its varieties, which have enjoyed a high degree of popularity as dwarf bedding plants.

But now it is the tall lobelias that call for notice, and with the prevailing taste in garden adornment, which one may aptly characterise as "natural," there certainly opens up a wide field for such decorative subjects as these. The situation "par excellence" for them is the bog garden or the waterside, where they can revel in the necessary moisture, and at the same time have the benefit of an open, sunny exposure. The same conditions which one associates with the Japanese and other moisture-loving iris will be found equally suitable for these lobelias, and, despite their character of not being quite hardy, they can be widely utilised for beautifying the water margins, and for naturalising in boggy situations.

Some very charming scenic effects have been created by planting these lobelias extensively by the sides of lily pools, and whether grouped alone, or in conjunction with astilbes, lythrums, epilobiums, lysimachias, spiræas, bog primulas, etc., they are certainly capable of producing very satisfactory results. Culture is not difficult in the case of these subjects, but with L. cardinalis, L. fulgens, and several of the finer hybrid forms, I would advise lifting them, and wintering them in a cold frame, but L. syphilitica and its varieties may be trusted to take good care of themselves during the cold season, though a light mulching of littery manure or a little bracken would do no harm.

Of the various species and varieties which are suited for the purpose in view, none are better known than L. cardinalis, a sterling gem, with scarlet blossoms and greenish foliage, which usually grows, in moisture, about three feet in height. A useful variety of this is Nanseniana, a dwarf, sturdier form, possessing a good habit, with rich crimson flowers, and foliage of a more bronzy hue. L. fulgens, with its intense crimson-purple leafage and stems, and its rich crimson-scarlet blossoms is of great value for the waterside. It is usually taller and stronger than L. cardinalis, and with its rich colouring makes a fine contrast to green-foliaged plants. Its variety "gigantea" is even grander than the type. It is moulded on nobler lines, the tall, massive spikes of large brilliant-hued blossoms giving a blaze of colour.

In L. syphilitica we have a species which has not only good qualities of its own, but has also assisted in the production of many of the finest hybrid forms. The type ranges in height from two to three feet, two and a-half feet being a good average. The foliage is deep green, rough, and covered with fine hairs, and the flowers are light blue, freely produced upon leafy spikes. Its principal varieties are violacea, a rich deep violet gem; rosea, a bright rosy-carmine; alba, a pure white, useful as a contrasting colour; and superba, a strong-growing, rich blue of decided merit. A good companion to the preceding is the sessile-leaved species from Northern China, L. sessilifolia. It is a strong, hardy species, about the same height as L. syphilitica, with leafy spikes and violet-purple blossoms.

Some of the new world lobelias are very worthy of notice, but are not sufficiently hardy to winter outside in many places. Chief among these is L. Cavanillesi, a Chilian species, with yellow flowers, which in good soil attains a height of three feet. Others worthy of culture are L. laxiflora, a pretty Mexican species, with handsomely foliaged spikes of red and yellow flowers, which is probably related to the previous species; and L. Tupa, a tall rarity from South America, with leafless spikes of deep red blossoms. The hybrid varieties are many, and some of the best-defined forms call for notice. It is interesting to note that the majority are the progeny of L. syphilitica, crossed with L. cardinalis and L. fulgens.

A small but representative collection of these hybrids would include Miller, a rich purple, with grand habit; Papillon, a good pure white; Gerardi, a fine soft rosy violet; Rivorei, a pretty blush-pink, with rich bronzy foliage; Carmine Gem, a rich, bright carmine; rosea (or Rosea Ardens), a gloriously distinct gem, brilliant rose in colour; Distinction, a strong-growing, rich crimson with purplish shading; Firefly, a glowing vivid fiery-red, and Ibis, rosy-scarlet, with a suffusion of salmon.

The ease with which these lobelias can be raised from seed, places them at the service of all classes of garden-lovers, and there is no reason why these plants should not rise greatly in public favour during the next few years. In conclusion, may I add, Plant boldly. It is the bold, free groups of these lobelias that produce telling effects. Do not be too sparing of the number of plants you put out; make large groups, which will give a distinctive feature to the scene, and do not let them lack manure, for they are gross feeders.

P. S. Hayward.

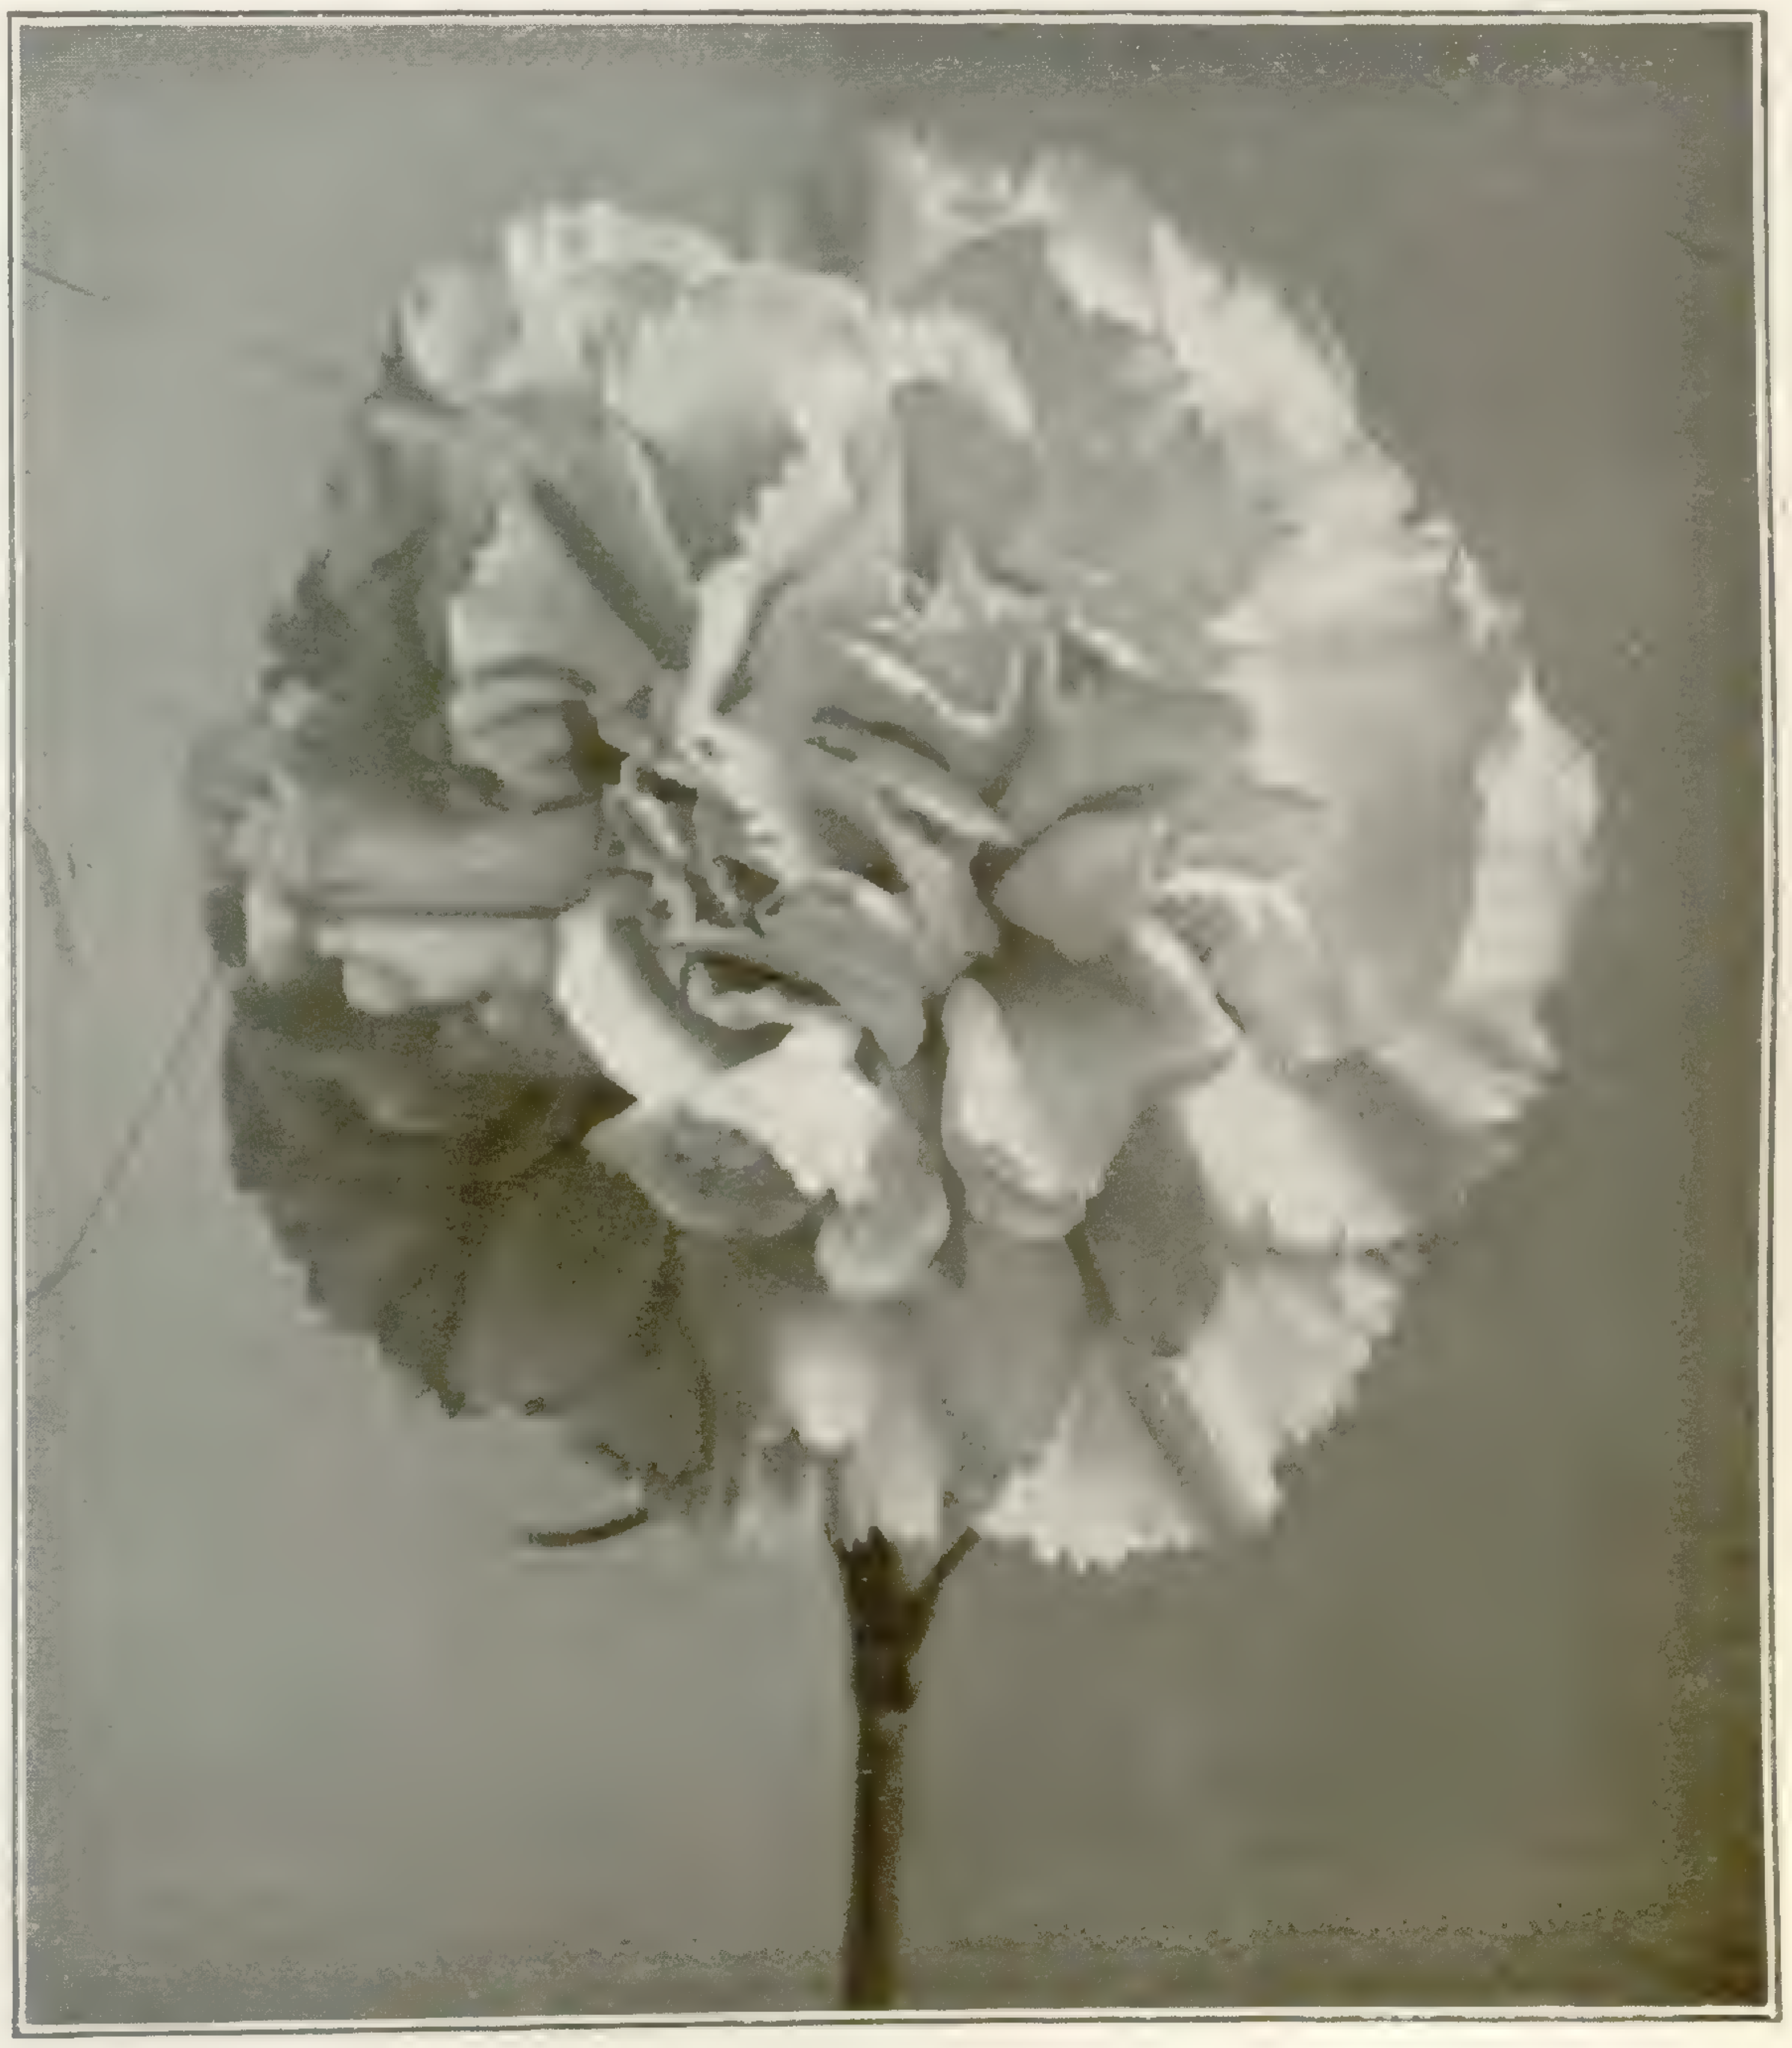
NEW CARNATION ADMIRATION.

Great advances are still being made in the production of perpetual-flowering carnations, and though latterly the home raisers have been very busy in this respect, and have distributed some very fine novelties, the florists of the United States are continuing their work with unabated energy. The new varieties of each season are imported from the States by our leading nurserymen, and the progress of these varieties as soon as they have been propagated and grown in this country is very carefully watched. One of the newer introductions is named Admiration, a rosy-pink variety that has become very highly esteemed already in America, and promises to take a leading place here. The flowers are about the same size as those of the popular Enchantress, but in both form and colour it is regarded as distinctly superior to that variety. It is a quick and free grower, of excellent habit, and comes very early into bloom, so that it combines those fine qualities that go to make up a first-rate perpetual carnation. We are indebted to Messrs. Stuart Low and Co., Bush Hill Park, Enfield, for the opportunity of illustrating this new variety.

Jasminum primulinum is by no means reliable as a hardy shrub, even when protected against walls, but as a greenhouse subject it is very welcome. The flowers open kindly with the minimum amount of artificial heat. It succeeds best under glass when grown in pots that have become well filled with roots the previous year, as the tendency of freshly-potted plants is to develop wood growths, the consequence being that few flowers reach their full development. Cuttings of this jasmine root readily in a propagating bed early in the year, and if potted up, and grown under glass till July,and then exposed to the sun in the open, they form useful plants for the decoration of the greenhouse the following year.—Thomas Smith, Louth.

ARISTOLOCHIA SIPHO.

Although three or four species of Birthwort (or aristolochia) are hardy in many parts of the British Isles, A. Sipho is the only one which people who do not require a full collection need trouble about, for it is the best-known kind, and the most satisfactory one for general use. It is a native of the United States, and is valuable for its rapid growth and large heart-shaped, ornamental leaves, which make it an ideal plant to place against a trellis, rough old tree, pergola, or other support, for given freedom of growth, and moderately good soil, it is quite capable of covering a support twenty-five to thirty feet high, but may, of course, be kept much dwarfer by repeated pruning.



NEW PERPETUAL CARNATION ADMIRATION.
Flower large, rosy pink, supplied by Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

The leaves may be anything between six and eight inches across, while the branches are thin and wiry, and if they cannot find anything to cling to quickly become entangled, forming quite a rope. The flowers are not worth considering, from an ornamental standpoint, but are exceedingly interesting structurally. They are tubular, the tube being curiously bent, and the mouth of the flower very wide in comparison with the tube. This peculiarity of shape has been likened to a pipe, and from that the common name of Dutchman's Pipe, which is applied to the plant, has arisen. As previously stated, moderately good soil is essential for the best results; it can, however, be cultivated in that of inferior quality, and good results have been observed from plants growing in sandy material.

D.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

LYCASTES.—Lycaste Skinneri, L. plana, L. Deppei, and other early species and hybrids will now be advancing their growths, and any repotting necessary should be attended to as soon as the new roots make their appearance. Before potting see that the leaves and pseudo-bulbs are free from scale or other insect pests, as the plants are more easily cleansed at this season than is the case when the young growths have become advanced. When potting lycastes the fact of their being vigorous feeders should not be overlooked; afford ample root space to all plants in vigorous health. In the case of small or weakly plants large pots should not be given. It is better to have to repot a small plant returning to its normal vigour than to destroy it by placing a great bulk of potting compost about its roots. The pots used should be clean, and filled to about one-half their depth with clean broken crocks. The compost should be two parts turfy loam to one part of fibrous peat and chopped sphagnum moss, with sufficient sand and finely broken crocks intermixed to render the compost porous.

PREPARING LOAM.—There is one item I would like to mention here, and it is the desirability of having the loam used for orchids prepared some time before it is required for use. Even where only a small quantity is required it is desirable to have it picked over and prepared beforehand. The turf must at all times be colder than the temperature of the house in which the plants have been grown, unless some steps are taken to prepare and place it in a warm position for some time before use. I find it a very good plan to have a few bushels of loam picked and placed in boxes either on or immediately below the pipes in one of the warm houses, so that a supply is always at hand.

ANGULOAS.—These orchids, in most cases, advance their flowers with the new growths, and it is not a good plan to treat them liberally when they first show signs of renewed vitality by the production of new growths from the base of last season's pseudo-bulbs. If treated too liberally they develop growth rapidly, and consequently do not flower satisfactorily. It is quite time enough to give a liberal watering when the flower buds can be seen at the sides of the new growths. Warmer treatment may also then be afforded. Any repotting necessary may be attended to as soon as the plants have passed out of flower. They require a compost similar to that used for lycastes. To increase the stock, where there are several pseudo-bulbs the rhizome between them may be severed. These old bulbs are of no advantage to the plant unless they can be induced to produce back growths, and the only way to secure this is to sever the rhizome, and then the dormant buds will break, and we obtain better specimens or increase the stock as desired.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Plants that are cultivated for the supply of large blooms should now be ready for shifting into six-inch pots. Employ a heavier compost than that which was used at the last potting; it may be formed of good fibrous loam, leaf-mould, wood ashes, lime rubble, and sand, with a sprinkling of bonemeal added. Care should be taken to see that the plants have formed plenty of roots, which reach the sides of the pots before they are potted. After the potting has been done place the plants in an unheated frame on a hard ash bottom. Pay careful attention to ventilation after, keeping the frame close for a few days until the roots are running freely in the new soil. When admitting air avoid cold draughts. Syringing may be done morning and evening in bright weather. If the presence of green-fly can be detected let the plants be dipped in quassia extract. During the present month attention should be given to pinching and stopping the shoots for securing second crown buds, but no definite date can be given for doing this work. When a plant has been stopped by pinching rather less water should be given at the roots until growth recommences. Pinching and potting should not be carried out at the same time, as each operation causes a check.

GERBERA JAMESONI.—It is only in very sheltered spots that the Transvaal daisy does well out of doors, but in every district it is an admirable plant for pot culture in the greenhouse, or it may be planted in frames along the front of glass-houses. Seeds may now be sown in moderate heat, and a good many of the seedlings will bloom in their second year. Pot plants now flowering should be kept in an extra cool house, and when finished flowering they may be placed out of doors on a bed of ashes, where they may remain all the summer and part of the autumn. Gerbera flowers when cut are good subjects for vase decoration, and they last fresh for a considerable time.

BALSAMS.—Seeds may be sown thinly in well-drained pans of light porous soil, and placed in a warm house. Prick off the seedlings into small pots as soon as they are large enough to be handled. Do not allow them to become potbound until after the final potting, and do not pinch the leading growths, but keep the surroundings always moist, and branching will come quite naturally.

CLIMBERS.—These will be growing freely and should have attention to thinning, as they flower much better when not overcrowded, as well as look neater.

STREPTOSOLEN JAMESONI.—This is a most useful plant for flowering in the greenhouse or conservatory in the early spring and summer months. It succeeds well if trained to a wall or on the roof, and continues to flower freely if kept growing in an upright position. If it is required for forming a specimen plant on a balloon-shaped trellis, the shoots should be started from the base, and trained spirally, but always upwards, for if allowed to hang downwards the shoots cease to flower, and sometimes die back to an upright joint. It suceeds well in a compost consisting of loam, peat, and sand in equal parts; provide liberal drainage, and make the soil moderately firm.

STANDARD HELIOTROPES.—A batch of cuttings should be put in, and as soon as rooted pot them off singly, and grow them to a height of two or three feet, when the top may be pinched out. Remove all buds from the stem from the base up to six inches from the top; pinch all the top shoots as they grow to induce a round head. Use five to six-inch pots, and when the weather is favourable remove out of doors for the summer. Give shelter in the winter in a peach house or vinery, keeping the roots rather dry. —W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

ALTERNANTHERAS, iresines, and coleuses should now be propagated with all possible speed, and bottom heat is absolutely essential if rapid propagation is desired. Pits or frames just cleared of violets or cauliflowers are suitable structures for this purpose, that is, if no propagating pit or house is available. Remove a portion of the soil, and put in sufficient fermenting material to form a shallow hotbed; then cover with three or four inches of light sandy soil, and face this with sharp sand. When the soil is well warmed through, and all danger of overheating is past, dibble in the cuttings about two inches apart each way, keep the frame close, shade from bright sunshine, and in a few days the cuttings will have rooted, soon to develop into useful plants for potting or boxing off. Hardening off should not be commenced too early, or there may be serious loss of foliage; ten days prior to planting out is quite sufficient, and this should not be commenced before the first week in June.

VARIEGATED ACERS AND ELDERS are very useful and accommodating plants for the flower garden, if grown in pots and plunged in the borders or beds as dot plants, or as groups, their pretty variegated foliage forming an agreeable contrast with the surroundings. By judicious annual pruning and potting these may be kept in good condition for a number of years. Lilies of many types might be grown for a similar purpose; these give a wealth of bloom late in the season, and are most accommodating. Any of the speciosum or trigrinum varieties may be so used. Plenty of room should be given these, so that each spike of bloom has room for development.

MIMULUS, Harrison's musk, and the common sweet-scented musk can all be used, and are useful as bedders. If only for their perfume these should find a place in every garden. Their flower production is continuous, and they succeed either in full sun or partial shade. All these are hardy, and are easily propagated from cuttings, divisions of the root, or from seeds. Plants raised from cuttings are perhaps the best, being more sturdy and compact than those raised from seeds or root divisions.

BEDDING CALCEOLARIAS, being half-hardy, may soon be planted out in the beds or borders; as they are moisture-loving the best way to grow them well is to provide a good depth of soil. The soil should be deeply dug, and a liberal quantity of well-rotted manure added to it at the same time. On light soils a good mulching of leaf-soil, old hotbed manure, or cocoanut fibre refuse should be given, and at no time during the season must the plants suffer from drought.

VIOLETS that have been growing and flowering in frames during the winter should now be planted on a north border for the summer. All the best and strongest runners that are sufficiently rooted should be first of all used, making up, if need be, the number of plants required for next season by dividing the healthiest and best of the old roots. Before planting, the ground should have been well dug, and leaf-mould, old hotbed manure (usually a mixture of manure and leaves) should be added. Like calceolarias, violets revel in moisture during the hot summer season, a point in their successful cultivation that should not be lost sight of.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

DISBUDDING.—The disbudding of peach, nectarine, and apricot trees should be proceeded with as soon as the shoots have pushed far enough to be easily handled. The work of disbudding should be done gradually, and sparingly at first. It often happens that the flow of sap is checked during a spell of cold weather, which we all experience at this season of the year. It is then advisable to discontinue disbudding for a few days until the weather is more congenial and the circulation of the sap has become more active. Commence disbudding by removing the shoots that spring from the underside and in front of the branches, these can be removed by the thumb and finger, or a better method to adopt is to use a pair of grape scissors. This work should be extended over a period of a few weeks before the final disbudding is accomplished, to allow the sap to become equally distributed in the remaining young shoots. Strict attention should be paid to the method of disbudding adopted; it should be done to maintain an abundance of young fruiting wood in the centre, as well as at the extremities of the trees; too much emphasis cannot be placed upon the importance of the proper training and the successful cultivation of these fruits.

GENERAL WORK.—Grafting may still be done on late varieties of apples and pears, taking care to use scions that have been kept in a dormant condition. Examine trees that have already been grafted, and see that all the scions are secured firmly to the stock, or failure is sure to follow. Continue to use the Dutch hoe in fruit plantations upon all favourable occasions, for obvious reasons, as advised in the last calendar. Where the blossoms of fruit trees growing on walls have been protected, and the petals have dropped off, the protecting material should be gradually removed. It is a good plan to remove it altogether on bright warm days, to be replaced at night only if there are any indications of frost, or cold, cutting winds, after this has been done for a week or ten days the material may be dispensed with altogether.

HARDY VINES.—Vines growing on south or warm walls will soon require attention in the matter of disbudding, and the training of young shoots required for extension to fill up any vacant places on the walls. All weakly and misplaced shoots which grow laterally from the main rods should be removed, allowing the strongest and best-placed shoots to remain. It is advisable at this season of the year to dust the young shoots over with flowers of sulphur, choosing a day when there is no wind, and, if possible, a time immediately after a shower of rain. This is one of the finest preventives of the attacks of red spider and mildew.—Henry R. Farmer, Cardiff Castle Gardens.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full [illegible] how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Ideal Homes Exhibition.

One of the most interesting exhibitions held in London for a long time is the Ideal Homes Exhibition that was opened at Olympia, Addison Road, London, on Friday, April 8, and continues for another week hence. Not only is the exhibition interesting; it is very instructive, and no visitor can fail to be struck by the many useful inventions displayed for the purpose of making homes brighter and more convenient, and keeping them as clean as the proverbial "new pin"; indeed, it would seem that the lady members of the household will soon have all the work of the home done by handy machines.

A BEAUTIFUL WATER GARDEN WITH WATERFALL.
Arranged by Messrs. Pulham and Son, at the Ideal Home Exhibition.

Of course, we all have our own ideas of what an ideal home should be like, and at this exhibition every taste is catered for in the matter of furniture, decoration, and sanitation, but however well and conveniently the home is furnished, it is certainly not ideal unless the surroundings are as beautiful as the interior. Flowers and plants—the garden, in short, is absolutely essential if we are to attain to anything approaching the ideal.

The promoters of the exhibition have felt the need of the garden, hence the garden-lover may spend a long time in inspecting the gardening features. The Tudor Village, outside the main hall, is a charming idea, with its irregular ring of quaint old tiled houses arranged around the village green, with a few ideal cottages dotting the green. Here is the village smithy, the village inn, and the carver, the rope-maker, the potter, the printer, and other tradesmen are all busy plying their trade under ideal conditions, their quaint and bright costumes lending colour to the scene. But what a vast amount of work was necessary to produce this green and provide the cottages with gardens. Yes, and the design and planting of nearly all of it has been carried out in a most admirable manner by Messrs. Joseph Cheal and Sons, Crawley. In one place they have a cottage garden idealised; it has its sheltering yew hedge and its cosy garden seat, its green lawn, and beds of spring flowers, its rose-clad trellises, and its little fruit garden with the cordon, pyramid, and bush trees just bursting into blossom. In another place, near the inn, the bowling green is inviting, and along one side of the village some local dignitary has commissioned the Messrs. Cheal to fashion a dainty garden, with its necessary tea house, inviting seats, and shady pergola, and well has the commission been carried out.

The Tudor Village is fortunate in having an excellent water supply, so that pleasure as well as profit may be obtained from it. Messrs. Pulham and Son, 71, Newman Street, W., have arranged a splendid waterfall, pool, and water garden. The rocks are set up in the most natural manner possible, and it looks as though water has been tumbling over them for hundreds of years. Low and creeping shrubs occupy positions in the rock niches, while around the pool below moisture-loving plants seem to have found an ideal home, and they may be closely inspected from the stepping stones across the water. Altogether it is a fine bit of work by this skilful firm.

In other parts of the exhibition garden furniture to suit all tastes and pockets is displayed. Messrs. B. Maggs and Co., Bristol, have provided an abundance of comfortable, artistic, and durable teak wood garden seats and tables. In the centre of the main hall Messrs. J. Cheal and Sons, Crawley, have set out a charming garden around the central "ideal home." Even the walls of the house are clothed with ivy and other creepers, and the flower beds are gay with spring flowers. The Messrs. Cheal laid out and planted the gardens and greens in the Tudor village and this ideal garden within a fortnight. Near the main entrance Messrs. Pulham and Son have a fine lot of garden pottery, their flower vases being of particularly elegant design.

Of course, "he who loves a garden loves a greenhouse, too," and so for the greenhouse lover Messrs. Duncan Tucker and Sons, Lim., 27, Cannon Street, E.C., have on view a "Caloricult" structure for forcing fruits, etc., with bottom heat, and a sharp-pitched roof to catch all the sunshine; serviceable garden frames in variety, a capital "general utility" span-roofed greenhouse, a neat little garden tea house, strongly and cosily built, and a side of an ornamental conservatory. Then for heating purposes Messrs. Toope and Son, Stepney, have a number of the most interesting and useful apparatus, suitable for the amateur's propagating frame, or the larger greenhouse and conservatory, and whether gas, or coal, or coke be the heating medium, every apparatus is designed to secure the greatest economy of fuel with the highest possible heating capacity. Messrs. Fenion and Sons have their specialities in hot-water heating apparatus for greenhouses, chiefly designed for the use of gas, and so designed that gas fumes cannot enter the house and kill the plants.

Alas! that it should be so, but insect and fungoid enemies cannot be kept from the ideal garden unless some pains are taken to keep them out, or to exterminate them once they get in. To combat and cure pests and diseases Messrs. Walter Voss and Co., Millwall, have on view a number of their specialities, and in their stand is quite an array of spraying machines, special syringes, insecticides, and fungicides, and, to help the plants themselves to defy enemies, the firm has skilfully concocted manures suitable for special crops, and arranged for use in various kinds of soils.

Messrs. E. A. White, Lim., Paddock Wood, Sussex, display their Abol insecticide, and show how it can be sprayed on to the crops by means of their Abol syringe. Most of our readers are aware that these syringes are among the very best on the market, and we have proved the Abol insecticides to be highly effective and satisfactory. Not far away Mr. Fred G. Wood, 161, Walworth Road, S.E., has garden sundries in great variety, and a really wonderful display of flower vases, fern pots, rose bowls, rustic table decorations, and a whole host of things to delight the ladies who use flowers in the adornment of their homes.

The fragrance of sweet peas is wafted all around this horticultural side of the hall, and it comes from the stall of Mr. Henry Eckford, Wem, the famous sweet pea raiser. The scent—put up in dainty bottles—is delicious and refreshing, and should there be any who prefer other floral odours to that of the sweet pea, many others are provided for them—but the speciality is the Eckford Essence of Sweet Peas. And now, since a rest "in a nook, with a book," comes welcome after a tour of the exhibition, the inspection may well finish at the neat garden house, kindly lent by Messrs. Boulton and Paul, of Norwich; here spread out seductively on tables and benches are guides to the culture of all kinds of popular flowers and garden crops, neat, concise, practical, and illustrated handbooks by well-known authors, and all published by Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C. The outer walls of this garden house are brilliant with climbing roses (natural, not artificial), and the varieties used are Delight—a glorified Hiawatha—Mrs. W. Flight, and Crimson Rambler, while the inner walls are bright with selections of the illustrations of plants and garden scenes that have appeared in the Gardeners' Magazine, and with a few of the more striking of the coloured plates that have appeared in our contemporary, "Amateur Gardening." If you are visiting the exhibition, don't forget to look up the "G. M." stall, with its roses and its gardening literature.

Birmingham Gardeners' Association.

One of the most interesting meetings of the society's spring session was held on the 4th inst., when the essays upon "Hardy Bulbs for the Open and Indoors" were read. The donor of the prizes was Mr. Robert Sydenham. It was an open competition, but the five contestants were journeymen gardeners. Messrs. Alfred Cryer, Thomas Burns, and William Gardiner were delegated to adjudicate upon the essays prior to the meeting day. Each paper was read by its writer. The comparative merits of the essays were so uniformly good that the adjudication was of no perfunctory character. A strict observance of the text, i.e., "Hardy Bulbs," was departed from by the essayists, inasmuch as tuberous, rhizomatous, and cormous plants were laid under contribution to swell a list of especially useful spring-flowering hardy plants. These discrepancies were allowed to pass muster, and the successful aspirants were placed in the following order: Messrs. P. Catt, Albert Wright, and Edward Wybrow, with Mr. Frank Harvey "highly commended." The first and third prizewinners are students in the Botanical Gardens, Edgbaston. The chairman warmly congratulated them for the really excellent essays, and his remarks were heartily endorsed by the audience.

In the animated discussion that followed the essays several of the members gave interesting and instructive particulars pertaining to the subjects.

Prizes for "three pots of hardy bulbs, not more than one variety in a pot," offered by the society, and open to all members, brought forth a remarkably good display of narcissi, hyacinths, and tulips, the winners being Messrs. Robert Usher, P. Catt, H. Keats, and R. Baynham.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, April 12.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair), Professor G. S. Boulger, F.L.S., Dr. A. B. Rendle, M.A., F.R.S., Messrs. J. Fraser, F.L.S., J. W. Odell, L. Crawshay, W. Arkwright, D.L., J. T. Bennett-Poë, M.A., E. M. Holmes, F.L.S., A. Worsley, A. Rolfe, A.L.S., and F. J. Chittenden (hon. secretary).

MONŒCIOUS WILLOW.—Mr. J. Fraser reported as follows on the specimen of Salix cinerea, bearing both male and female catkins, shown at the last meeting. In the female catkins the normally two stamens of the flowers were represented by two imperfect ovaries, the pedicels of which were 7 mm. to 8 mm. long, and corresponded with the two filaments, and the ovaries 3.5 mm. long, and corresponded with the anthers. The pistil was open on one side, so as to expose the two ovules, and was separable into two carpels, with a short style and undivided stigma to each. The ovule, without the funiculus, measured 184 u., and appeared perfect, except that the coma or parachute was absent. Each of the two carpels had a short placenta near the base, each bearing one ovule, the placenta and ovule being marginal and exposed. Below the middle of the ovary were the two contiguous cells of the anther, about the normal length, but without pollen. In the abnormal male catkins, which also occurred, the filaments were hairy at the base only, and were normal; the anthers cells sometimes three instead of four; the connective dilated between the cells and elongated above the anther, often separated into two and terminating in a stigma each, partly papillose, and capable of retaining pollen. The pollen was 20 u. to 28 u. long, normal, but often 4 u. to 8 u. below the usual size, and in very small quantity. Mr. Crawshay exhibited drawings illustrating the aberrations, and pointed out that the branches usually bore flowers of one kind only; but in one case he found the flowers in some catkins on a branch differed from these in others.

MONŒCIOUS POPULUS TREMULA. — Mr. J. Fraser also showed catkins of Populus tremula containing both pistils and stamens, these being the last formed by the tree.

MANY-FLOWERED TULIPS. — Rev. J. Jacob showed, on behalf of M. Bony, of Clermont-Ferrand, some pots of tulip M. S. Mottet, bearing several flowers from a bulb and branching inflorescences. This character had been found to breed true in the seedlings, and the committee recommended that a Certificate of Appreciation should be awarded to M. Bony in recognition of his work in proving this transmission.

CALLICOMA SERRATIFOLIA. — Sir Daniel Morris, K.C.V.O., sent a dried specimen of this handsome tree, which he had seen growing in the Azores. It has serrate leaves, about three inches long, woolly below, and almost globular heads of flowers. It is particularly remarkable as a tree, growing 50 feet to 60 feet high, and a member of the family saxifragaceæ. It is a native of Australia, where the early settlers called it "Black Wattle," a name usually associated with Acacia decurrens — quite a different thing; and another native name is "Native Beech." Its wood is said to have a reddish tint.

CHINESE PLANTS.—Mr. G. Paul sent plants of Ilex Perneyi in bloom (the flowers of this beautiful Chinese species prove to be hermaphrodite), Osmanthus Delavayi, with flowers about four times the size of those of O. ilicifolius, and reminding one of an escallonia, and Canierea calycina, figured in Rev. Hort., 1896, p. 498.

OPUNTIA IN QUEENSLAND.—Professor Henslow sent the following communication which he had received from Surgeon-General Geo. Henderson, M.D., F.L.S., formerly Director of the Royal Botanic Gardens, Calcutta: "In a communication to the Royal Horticultural Society's "Journal" for March, 1910, at p. 350, I see you notice the Prickly Pear in Queensland. In the Punjab, India, before annexation, about 1849, this plant was a pest, and covered many miles of country. Ringret Singh is said to have had out some of his regiments to cut it down but that did no good, unless it was burned, for every bit of it rooted and produced more plants; but about 1845 the wild cochineal insect was introduced (by mistake, it is supposed, for the cultivated or domesticated one), and, as it by magic, it spread all over the province and destroyed the Prickly Pear, which has never given any trouble since. I can find few references to this matter in any books, but I find one letter from Sir Donald McLeod, then Mr. McLeod, Commissioner of Lucknow, at p. 265 of "Select Papers" of Agri-Horticultural Society of Punjab, 1868. The letter is dated December, 1852, and merely mentions the fact that 'an extraordinary influx of this insect (cochineal) almost exterminated the plant.' I lately wrote to Sir William MacGregor, Governor of Queensland, and told him about this. The cochineal would be easily introduced, for I took two pieces of Prickly Pear covered with the insect from Teneriffe to New Zealand in 1883, simply stuck on to two nails in my cabin wall, and delivered them to Dr. Hector when I arrived. I find in the book referred to a few casual references to the disappearance of the plant from the Punjab, but nothing very definite. I know for certain that the plant had never given any trouble up to 1889, for I lived much in the Punjab."

Liverpool Horticultural Association.

APRIL 6 and 7.

The Liverpool Association did not hold a spring show in 1909, but with somewhat improved circumstances it has again reverted to three shows, to be held in the Corn Exchange, and it is hoped that a wider interest may be created so that the finances may be placed on a firmer footing.

The entries for the spring show on April 6 and 7 were satisfactory, and the exhibits of a very high character. Cymbidium Lowianum and exotic ferns staged by Mr. G. Eaton, the dendrobiums from Mr. W. Hignett, the rhododendrons, azaleas, and palms from Mr. B. Cromwell, and the cyclamen and roses staged by Mr. T. Hitchman and Mr. E. R. Finch, were all evidence of great skill in culture, and were greatly appreciated by the visitors. Only a few of the more important classes can be dealt with here, but it may be stated that the competitive classes throughout were filled with exhibits of more than average beauty and interest.

Mr. B. Cromwell, gardener to T. S. Timmis, Esq., Allerton, contributed excellent kentias in the class for two palms; he led for azaleas with finely flowered plants; his Rhododendron Pink Pearl was excellent, while the Ghent azalea, the first in its class, was delightful in colour and profuse in bloom; his Clivia princeps was also excellent as a greenhouse plant in flower.

Mr. G. Eaton, gardener to W. Tod, Esq., contributed a fine Cymbidium Lowianum with 15 strong spikes, while his Davallia fijiensis, and D. Mooreana, in the exotic fern class, were notably good. Mr. T. Hitchman, gardener to A. Earle, Esq., staged Rambler roses, in which W. A. Richardson and Dorothy Perkins were prominent; his white cyclamen were charming, and his hyacinths were in excellent form. Mr. E. R. Finch, gardener to W. J. Lockett, Esq., had excellent hardy herbaceous plants, liliums, spiræas, etc., and among his hardy forced plants were large lilacs and rhododendrons.

Mr. J. V. Thompson, gardener to Mrs. W. P. Sinclair, had the leading hyacinths and tulips, and these were good for the late season. Mr. Thomas Rigg, gardener to Miss

Mackean, was a prize winner with amaryllis. Mr. W. Hignett, gardener to C. W. Carver, Esq., scored with his dendrobiums, three feet in diameter, and flowered down to the pot. Mr. J. Frith, gardener to T. Hignett, Esq., led in the class for odontoglossums. Mr. G. Osborne had some excellent palms in small pots, and a good dozen vases of cut narcissus. Mr. F. Atken, gardener to T. W. Wright, Esq., staged a fine single specimen palm.

Sixteen firms contributed non-competitive displays. Messrs. Mansell and Hatcher, Rawdon, were awarded a gold medal for a group of well-grown orchids of much merit. Other medals were awarded to Messrs. R. P. Ker and Sons, Aigburth, for amaryllis; Mr. C. A. Young, Hatherley, for carnations; Mr. W. Rowlands, for roses; Messrs. Barr and Sons, Covent Garden, for daffodils; Messrs. Cartwright and Goodwin, Kidderminster, for daffodils; Messrs. Hogg and Robertson, Dublin, and Mr. J. Cooper, Lissadell Farm, Sligo, for displays of daffodils.

Elstree Horticultural Society.

Mr. E. Beckett, V.M.H., of Aldenham House Gardens, was the lecturer on Tuesday evening, the 5th inst., and his subject was "Choice Flowering and other Shrubs." In his opening remarks he referred to the beauty and utility of many of these plants, and urged a more extended use of them in preference to common things of less merit. Planting and pruning were important items, and were thoroughly dealt with, and the paper was brimful of useful information.

A splendid series of lantern slides lent additional interest to the lecture and were fully appreciated by the large assembly of members and others present. A hearty vote of thanks was accorded the lecturer. Several new members were enrolled.

Dundee Horticultural Association.

The ordinary monthly meeting, held in the Technical Institute on the 4th inst., took the form of a "Cineraria conference." Mr. George Petrie, president of the Stirling Horticultural Association, opened the proceedings by reading an excellent paper on the history and cultivation of this indispensable winter and spring flower. There was a good turnout of members, but the exhibits were not so numerous nor so meritorious as was expected. The paper proved very interesting, and in the lively discussions which ensued many practical points were enlarged upon which will prove helpful to those who have not hitherto been successful with cinerarias.

Two new members were added, and Mr. William Christeson was elected president for the remainder of this session.

Bristol Gardeners' Association.

At the fortnightly meeting held at St. John's Parish Rooms, on Thursday, April 7, there was a good attendance of members, Mr. E. T. Parker presiding.

The subject for the evening was "Border Carnations," introduced by Mr. C. Wall, Bath, a well-known carnation-raiser and prizewinner. He gave a most practical paper and advised planting early for outdoor bloom, and observed that some varieties should be potted up and wintered in frames, giving them abundance of air at all times. He advocated showing carnations in vases, and did not approve of the style of flattening them out on boards. Mr. Wall gave practical hints on layering, planting out in beds, disbudding, shading, and preparing for shows. He also advised sowing seeds, but at the same time said that there was scarcely one champion flower in a 1,000 seedlings. Mr. Wall said many people wrote him for seed, and expected it to come up true to the variety from which it was gathered.

For three cool house orchids, prize given by Dr. R. Eager, Messrs. Gestling, Curtis, and Woodward won in the order given. For two vases of daffodils, prize given by Mr. Binfield, for under-gardeners only, Messrs. Coombs, Dainton, and Newman won.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

HORTICULTURAL EXHIBITION AT LIVERPOOL. — T. H. K., Wavertree: Schedules may be obtained from Mr. Thos. McRow, secretary, Royal Agricultural Society, 16, Bedford Square, London, W.C.

GARDENERS' ORPHAN FUND. — S., Hexham: Full particulars of the Gardeners' Orphan Fund can be obtained on application to the secretary, Mr. Brian Wynne, Milton House, Surrey Street, Strand, W.C. The next annual dinner will be held at the Hotel Cecil, on May 19.

DOUBLE-SPATHED ARUMS. — R. W., West Drayton: Arum lilies are very freakish, and often produce twin spathes, though it is very seldom two spadices are produced from one stem. In the examples sent there is one perfect spathe and central spadix, but the secondary and outer spathe in each case is greener and more nearly like a leaf in shape and texture. The spathe is really a white leaf, produced in such a way as to shelter the flowers on the spadix, and advertise to the insect world that here is nectar and also, incidentally, flowers to fertilise. Cultivation has improved the spathe, but now and then Nature shows us that spathe and petal are but coloured leaves, somewhat altered in form for a special purpose in view, i.e., the continuity of the species.

DAMAGE TO PRIMULA LEAVES AND PTERIS FRONDS.—W. P., Newcastle: We can find no insects either on the leaves of Primula obconica or the Pteris fronds, but the appearance of the specimens suggests that a tiny mite, like the Begonia mite, has been at work. Probably the means you have adopted have exterminated the pest, but should the trouble again arise dust with tobacco powder, or dip the plants occasionally in a nicotine solution.

MILDEW ON ROSES.—W. W., Gloucester: An error in ventilation is often responsible for mildew on roses under glass, but mildew can be cured by spraying the affected parts with a solution of sulphide of potassium at the rate of half an ounce to a gallon of water. Dissolve the potassium sulphide (liver of sulphur) in hot water, and then add the necessary amount of tepid water. Spray at intervals of ten days as a preventive.

MALFORMED CŒLOGYNE. — A. J. C., Hendon: The plant seems to have been caught between two minds, and so failed in both directions. The pseudo-bulbs are made after the flowers have faded, but in this instance the plant has tried to make a pseudo-bulb and flower at the same time. It is a very unusual occurrence, and suggests a check of some kind. Probably the plant was kept too dry during its period of rest. The weakness of the growth accounts for the lack of petals and other malformations in the flower.

PLANTING SWEET PEAS.—E. R. P., Saffron Walden: If the ground is ready then proceed at once to plant cut the sweet peas, first taking care that the soil in the pots is not dry. It is always a good plan to carefully examine any plants in pots a few hours before they are to be planted, watering all that need such attention. Place some foot-high twigs (old birch broom heads provide splendid material) around the plants after planting, and give sufficient tepid water to settle the soil about the roots. We have come to the conclusion that the plants may be separated and planted singly, after having been grown four or five together in a pot, without suffering any real injury, provided they were well watered a short time previously, and are shaken from the soil with great care. The success of this operation is in the hands of the planter. Even in the case of autumn-sown sweet peas the roots may be disentangled with scarcely a break, and these may be planted by means of a trowel, and careful fingers without harm. Two lines of thread over the rows of plants to scare the birds, and a dusting of soot to keep slugs away, are other matters of importance. You cannot do better than obtain "Sweet Peas and Their Cultivation," by Charles H. Curtis, post free for 1s. 2d., or 1s. 8d. (cloth), from the Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.

DIVIDING AND REPLANTING HARDY FERNS.—M. M. G., St. Neots: April is an excellent time in which to divide and replant hardy ferns, and the earlier the work is done the better. Where it is necessary to lift a number of plants every care should be taken of them while they are out of the soil. Put them in a shady place, and cover with a wet mat. Ordinary garden soil will suit the ferns if the position is a shaded one, but if leaf-mould and peat can be provided these may be advantageously added to the soil. If the work is left much later a number of the new roots will be damaged, and the unfolding fronds may also suffer.

GLADIOLUS BRENCHLEYENSIS.—T. C., Bridlington: The advice you have received is excellent; we heartily endorse it. As your soil is rather heavy place a handful of sand under and around each corm, when planting. Gladiolus Brenchleyensis should be planted a foot or fifteen inches apart in groups of a dozen or more, as they are then much more effective than when planted singly or in threes.

NAMES OF PLANTS.

H. R., no address.—Eucalyptus cordata.

R. B. P., Louth.—1, Cattleya Schroderæ; 2, Abies Douglasi.

M. E. J., Surbiton.—1, Forsythia suspensa; 2, Prunus triloba; 3, Synthyris reniformis.

D. F. H., Loughborough.—1, Cyrtomium falcatum; 2, Helxine Solieroli; 3, Pilea muscosa.

S. W., Windsor.—1, Iris stylosa; 2, Ribes sanguinea; 3, Anemone hepatica; 4, Saxifraga Burseriana; 5, S. apiculata; 6, Prunus triloba.

C. G. T., Bideford.—1, Helleborus colchicus; 2, Rhododendron barbatum; 3, Sophronitis grandiflora; 4, Epidendrum variegatum.

NAMES OF FRUITS.

We cannot guarantee the correctness of the following names, as fruits are so much out of character at this season, owing to shrivelling. We shall be glad to assist our correspondents if they will send full-sized fruits late in the autumn.

H. S., Aylesbury. — Bedfordshire Foundling.

W. C. and T. C., Taunton.—1, Catshead, 2, Margil.

T. H., Kingston.—1, Not recognised; 2, Hawthornden; 3, King of Tompkins County; 4, Schoolmaster.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Dulwich Chrysanthemum and Horticultural Society.—Summer Show in the Imperial Hall, East Dulwich, on July 21; Chrysanthemum Show at the Baths, Goose Green, on November 9 and 10.

Penarth Rose Society.—The Second Annual Show will be held in the Cricket Field, Penarth, on July 6.

Massachusetts Horticultural Society.—Great Exhibition of Orchids, to be held on May 26-30, in the Horticultural Hall, Boston, Mass., U.S.A.

OBITUARY.

◆

MR. WILLIAM DENNING.

On March 2, after a brief illness, one of the old school of gardeners passed away at Hampton, in the person of Mr. Wm. Denning His gardening career was begun at Grimston Park, Tadcaster, and from here he went to Tortworth Court, Patshull, and Kew; he left Kew as far back as 1856. He was appointed head gardener to Lord Bolton at Bolton Hall, and then occupied a similar position for Lord Londesborough at Grimston Park, and subsequently at Kingston Hill. Mr. Denning was a splendid plantsman, and grew orchids well. In 1887 Mr. Denning commenced the cultivation of plants, flowers, and fruits for market at Hampton, and was particularly successful in forcing flowers. He took a keen interest in local affairs, sat on the Urban District Council for fifteen years, and was chairman about three years ago. Both the gardening charities had his wide and practical sympathy, and he was present at the last annual meeting of the Royal Gardeners' Benevolent Institution. Mr. Denning had just completed his 73rd year.

TRADE NOTE.

Messrs. Stuart Low and Co. write: "With reference to the cyclamen flower we sent you last week, we omitted to mention we are calling this Eileen Low." This refers to the red cyclamen with silvery-white crest and edges.

Falmouth Spring Show; two days.
Newent Spring Show.
Linnean Society Meeting.
FRIDAY, April 22.—Exeter Spring Show.

CATALOGUES RECEIVED.

BOULTON AND PAUL, NORWICH.—As the time will soon be here when we shall be able to live a great deal in the garden, the question of suitable garden seats, at once comfortable, durable, and artistic, arises, and there seems to be no end to the designs, judging from Messrs. Boulton and Paul's catalogue. Arbors, bowers, tea tables, etc., are also illustrated, and one catalogue is devoted to seats suitable for public parks, parades, etc., and yet another list deals with garden stairways, tables, water troughs, well heads, sun-dials, plant boxes, and other useful items of garden furniture

JOSEPH BENTLEY, LIM., BARROW-ON-HUMBER, HULL.—A handy pocket list of specialities for the improvement of lawns and the eradication of weeds on tennis courts, bowling greens, etc.

J. BURRELL AND CO., HOWE HOUSE NURSERIES, CAMBRIDGE.—An up-to-date list of cactus, paeony, and pompon dahlias, including seven new cactus and two new miniature cactus varieties raised by the firm.

CHARLESWORTH AND CO., HAYWARDS HEATH, SUSSEX.—A very complete descriptive catalogue of orchids in stock at this firm's new nursery at Hayward's Heath. Great prominence is given to hybrids, and there are beautiful coloured illustrations of Cattleya Venus, Cypripedium Charlesworthi var. Bromilowæ, Odontoglossum eximium Charlesworth's var., and Zygocolax [illegible] [illegible].

GEORGE BUNYARD AND CO., LIM., MAIDSTONE.—Hardy herbaceous plants are well described and figured in this new catalogue, but the great features are the new, beautiful and graceful Michaelmas Daisies raised by Mr. E. Beckett; the "Shakespeare" delphiniums, all named after Shakespearian characters; and the primrose coloured delphiniums, raised by Mr. F. Smith at Weybridge.

F. BEDDAWAY AND CO., LIM., 212, SHAFTESBURY AVENUE, W.C.—Although we are now in the month of showers the time will soon be upon us when artificial watering out of doors will be imperative, hence the need of considering garden watering apparatus such as provided by the above firm. Their catalogue of hose, fittings, sprinklers, engines, etc., is well worth perusal.

TWO NEW CHOICE and RARE HARDY PLANTS.

CALCEOLARIA—Golden Glory, rich golden yellow, large flowers; should be planted in a warm sheltered position, but not too dry. It is also a very useful pot plant for cool greenhouse, should be slightly protected during winter in the open with dry leaves or other litter.
9 in., **1/-** each; **10/6** doz.

DIANTHUS (Pink)—**Gloriosa,** a little earlier in flowering than the *Delicata*; large flowers very full and of a pinkish lilac, useful for cutting purposes. A fine variety for the border or any other part of the garden and perfectly hardy; strong plants.
1 ft., **1/-** each; **10/-** doz.

MONEY RETURNED IF NOT APPROVED.

OUR Renowned Catalogue of **Herbaceous and Alpine Plants,** not merely a price list, but a book of 200 pages, full of useful information, post free on application.

Nether Green Nursery, **SHEFFIELD.**

SOW NOW.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Weeds.

Just as dirt has been pronounced to be "matter in the wrong place," so may weeds be characterised as plants in the wrong place, since it is impossible to draw a hard-and-fast line between them and what may be termed garden plants proper. There are, for instance, many exotics grown in our conservatories which in their native habitats would be classed as weeds, so rankly and abundantly do they grow, and even one and the same species common to widely separated habitats may be regarded as well worthy of cultivation in one country and as a pestilential weed in another. Our pretty native fern Blechnum spicant, for instance, is reported in British Columbia as such an invader of cultivated ground that it persistently chokes out and destroys plantations of young rhododendrons, etc., unless kept under by drastic measures. The beautiful Water Hyacinth (Eichornia), here a choice aquatic, has, in some of the warm rivers of the world, spread to such an extent as to impede navigation, and thus constitute a noxious weed despite its intrinsic beauty. Many hardy flowers of great beauty seem endowed with such reproductive vigour and invading powers as to practically render them weeds in the sense that they must be largely eradicated to give other flowers a chance of survival. We may instance the harpaliums and Anemone japonica as terrible sinners in this respect. The former when once introduced, sends out from the base of every flowering stem a radiating mass of roots a foot or two long, each tipped with a bud. These penetrate the soil in all directions, undermining all the neighbouring plants and robbing them of nourishment, and in a season or two absolutely monopolise the soil for yards around. If an attempt be made to pull them up, the roots break off, and every tip or piece becomes a plant the following season, forming a dense thicket. Anemone japonica, a charming flower in its various types, is nearly as bad, producing long underground stolons, literally encrusted with buds, from which plants are generated in all directions entirely irrespective of the claims of adjacent plants either to light and air or root room. In conflict with these robust invaders, even the common or true weeds of the garden have no chance in most cases. One of the general characteristics of a "weed" is indeed its extra reproductive powers, either in the way of abundant seed dispersion and the capacity of its seeds to germinate freely, or in the way of burrowing budding roots by which it propagates itself still more insidiously, and which are less easily eradicated than mere seedlings. Abundance of seed, however, may prove a great nuisance, the Evening Primrose (Œnothera) and the Michaelmas Daisy (Aster) tribes are far too generous in this respect, their seedlings often invading a garden so pertinaciously as to repay temporary neglect by a perfect jungle of youngsters. From these facts and innumerable others which might be cited, it is clear that the definition of a weed can hardly be confined to the chickweeds, groundsels, dandelions, thistles, milkworts, etc., etc., etc., which assert themselves purely spontaneously in our gardens, and do their very best to monopolise the soil and oust the choicer plants installed therein. The question that often strikes us when studying even these waifs and strays is, how many of them would respond to selective culture and take their place among the élite if given the chance. Weeds, adopting the term for wild plants generally, native and exotic, are the raw material from which many of our choicest horticultural gems have been evolved. To cite one instance alone, the chrysanthemum itself in its original form is but a weed which the intrusive daisy of our lawns can rival in size and beauty, while in the more prosaic domain of culinary vegetables what must we say of the cabbage, a mere seaside weed, which has given us all the wonderful array of cabbages, cauliflowers, Brussels sprouts, kales, and savoys, etc., one and all the outcome of selection as differentially applied to the foliage, the flower, and the stem. Verily, there is more in weeds than meets the eye.

MR. H. SOMERS RIVERS.

Mr. H. Somers Rivers, as so well known, is a member of the firm of Messrs. T. Rivers and Son, and, in conjunction with his brother, has rendered splendid service in the cause of fruit culture, and fully maintained the high reputation the Sawbridgeworth nurseries have enjoyed for three-quarters of a century or so. Although comparatively young, a very considerable period has elapsed since we first had the pleasure of meeting Mr. Somers Rivers in one of the orchard houses which form so notable a feature of the firm's establishment, and we were then much impressed by the keen interest he evinced both in the raising of new fruits and the making of fruit trees, and the thorough acquaintance he had with all that relates to the production of new and improved fruits, and to the efficient conduct of an extensive nursery establishment of the highest class. We mention this as showing that, while quite young, Mr. Somers Rivers greatly interested himself in the work that was then being so successfully accomplished by his father, the late Mr. T. Francis Rivers, in the improvement of choice fruits, and thereby obtained the fullest benefit from his training in the art of fruit culture. This interest has been fully maintained until the present time, and as one result he has obtained, and deservedly so, a foremost position among the pomologists of the present day. As a proof of this we would mention that Mr. Somers Rivers has been invited to read a paper on stocks for fruit trees at the fruit congress to be held at Hexham in October next. It is a matter of common knowledge that Messrs. T. Rivers and Son have raised many varieties of peaches, nectarines, pears, and plums that are of immense value; the most recent of the peaches with which they have enriched our gardens being Thomas Rivers, a late variety of much merit, and Duchess of Cornwall and Duke of York, two early varieties that by reason of their earliness and high quality are rapidly acquiring popularity.

Vandalism at Camberwell.—A short time since we directed attention to the manner in which the trees in Camberwell Grove and Grove Park had been pruned this season, and we invited the Town Clerk of Camberwell, who admitted in his defence of what had been done in Grove Park that some of the lopped trees were ugly, to point out those which were handsome. This he has not done, but at the recent meeting of the Works Committee of the Camberwell Borough Council, he reported that he had invited an eminent authority upon the management of trees to inspect and report on the pruned trees. In his report this eminent authority stated that the art of pruning trees was not generally understood. Many of the older trees in the Camberwell streets were either crippled or deformed, and to prune them so as to get them to grow shapely required both courage and judgment. The operation had left some of the trees bare and skeleton-like, but it was the only remedy short of cutting them down; and in a year or two, providing they received proper attention, the improvement would be evident. So far as he could see, what was needed had been done to set them on the way to restoration, and the council need have no fear as to this. The younger trees, he considered, had also been pruned on correct lines, and those recently planted required to be pruned at once, so as to lay the foundation of a well-balanced tree. All young trees, and especially those planted in streets, required to be watched, and any irregular growth corrected in time. When the right kind of trees were planted and properly controlled from the start by judicious pruning, etc., difficulties such as those they were now experiencing in Camberwell with the old trees never arose. At Kew many old and misshapen trees had been restored by treatment quite as drastic as anything they had done at Camberwell. We should like to know the name of this eminent authority, and we are not a little surprised it has not been given. We should further like to have some instances of trees at Kew having been lopped in a manner similar to those in Grove Park, for mere generalisation is of no value in a case of this kind.

Birmingham Flower Show.—Encouraged by the great success of the orchid and rose shows held last year at the Botanical Gardens, Edgbaston, the committee of the Birmingham Botanical and Horticultural Society have decided to hold two shows during the present year. The dates are June 8 for orchids and summer flowers, and July 20 for roses and midsummer flowers. Exhibits not for competition are invited, and schedules may be obtained from the honorary secretaries, Messrs. Humphreys and Whitelock.

Encourage the Young Men.—We have on so many occasions impressed upon the officers of horticultural societies the great desirability and usefulness of encouraging the young members to read papers and discuss subjects brought forward, that we are delighted to find Professor L. H. Bailey, of Cornell University, giving utterance to the same views. Speaking at the annual meeting of the Western New York Horticultural Society, he said: It is a great satisfaction when I come to this Western New York Horticultural Society to see so many young faces in the audience. The most hopeful thing in the society is this; when the older ones of us pass away, there are younger ones to take our places; and I hope the older men will never discontinue attending because the young men come, because the young men need their counsel, their encouragement, and their guidance. I have not understood until late years how much it means to a young man to have persons ripe in the experience of life sit quietly and hear him talk and give him now and then wise words of advice. The hope of all our future lies in the young men and young women. I am anxious to send these young people out into the world whirling hot with enthusiasm, full of good ideas and practical abilities, in order that the rural affairs of the nation may feel their galvanic touch and that the agricultural communities may take their places where they belong, with the great commercial, intellectual, and, aye, spiritual interests of the country.

Garden Huts on the Sheffield Allotments have hitherto been erected as shelters and workshops, without any regard for appearance, and this state of affairs has offended the artistic taste of many good folk. For the purpose of removing the offence the city fathers propose to make all new allotment holders who desire to erect a hut construct it upon the lines of one designed by the City Engineer, or, at least, one not less substantial. If this proposal is carried out the structures made up of old boiler iron, enamelled kitchen ware, a few bricks, pitch and tar, with an old bucket for a chimney, will gradually disappear.

Popular American Apples for England.—In a wonderfully well-prepared report upon the exportations of American apples, by Mr. S. Fraser, of Geneseo, New Jersey, and presented to the Western New York Horticultural Society, the statement is made that the popular apples for the English markets are Baldwin, Greening, Spy, King, Newtown Pippin, Golden Russet. Jonathan sells well in London in boxes, but is too soft to go into barrels. Most fall apples are too soft and do not ship well. Twenty Ounce sells moderately in London. Gravenstein comes mostly from Nova Scotia. Sweet apples are not wanted. Liverpool, Manchester, Glasgow, and London are well established markets. Bristol is coming up; it is in the heart of an apple-growing district, and nothing should be sent there before November 1. Cardiff is rapidly rising in prominence, since it is surrounded by a large working population, and can take large quantities of apples. Hull has an export trade with the continent of Europe and for this requires Baldwin, King, Ben Davis, Golden Russet, and Newtown in boxes. The salesmen of this port can frequently handle 2in. and 2¼in. apples better than some other places, since apples in Europe are sold by weight. The important factor in their trade is that the fruit must be capable of long shipment. There is considerable demand for Seek-no-Further by some of the trade in London, Manchester, and other markets. This variety will always sell well if any size and clear.

Mr. George Woodgate, who has occupied the position of head gardener at Rolleston Hall, Burton-on-Trent, the seat of Sir Oswald Mosley, Bart., during the past sixteen years, is, we regret to learn, retiring from that position owing to indifferent health, and, as announced on another page, he is succeeded by Mr. H. Collier, who has been foreman in the Rolleston Hall Gardens during the past three years.

Weather at Glasgow in 1909.—The meteorological notes and remarks on the weather experienced at Glasgow during 1909 by Mr. James Whitton, are, as usual, of much interest, this being greatly enhanced by observations on the effect of the weather on vegetation. The rainfall was heavier than in the previous year, the total amount registered (38.26 inches) having been 4.68 inches more, but the amount is about the average for the district. With reference to the temperature, Mr. Whitton states that, owing to the prevalence of cold easterly winds, heavier rainfall, and severer frosts, along with an absence of bright sunshine, the average temperature was lower. Frost was registered on 58 days to the extent of 349 deg., and occurred in all the months excepting June, July, August, and September. The coldest month was November, which had 120 deg. of frost to its credit, occurring on 17 days, the next coldest being December with 87 deg. on 10 days, and March with 74 deg. on 10 days. The lowest readings for the year were on March 3 and 4, when 16 deg. frost were registered. Throughout the year the temperature fell to freezing point (32deg. Fahr.) on 78 days, while on three occasions it did not rise above that point. The highest reading for the year of the thermometer in the shade was 77 deg. on May 6. Only on three occasions was the thermometer above 70 deg., and at or above 60 deg. on 88 days.

Encouragement of Gardening at Arbroath.—To encourage gardening the Gas Committee at Arbroath has offered its employees the use of a piece of vacant ground around a new gasholder, for gardening purposes. A number have accepted the offer, and the ground will be divided among them. This is another of the many instances where vacant land attached to gas works has been lent to those employees having a love for gardening.

Coning of Sequoia gigantea.—Although cones have frequently been recorded on specimens of Sequoia gigantea, and in some places coning is practically of annual occurrence, in many gardens cones have never been produced, though trees of considerable proportions are found. A fine lot of cones were noted quite recently on the Ashridge estate of Earl Brownlow. On this estate an avenue of sequoias exists, and the trees are in the best of health, being vigorous, of a good colour, and evenly branched from base to summit. The cones on different trees vary considerably in size, those on some examples being a couple of inches long and rather more than an inch through, whilst on other trees they are scarcely more than an inch in length, and almost round. The trees in this avenue also exhibit some difference in habit; one of the small-coned trees being specially noticeable by the pendulous character of the branches, and their finer character than those of neighbouring trees, whilst size of leaves and colour also appear somewhat different. Young cones, both male and female, may be looked for on the sequoia at the present time; the female ones, which are found near the apex of the branches are brownish in colour, whilst the male flowers are quite easily distinguished by their yellowish colour and dustlike pollen. For a tree which is acknowledged to be one of the largest-growing trees in the world, both cones and seeds are small, the latter being thin and scarcely an eighth of an inch across.

Value of Potato Crop, 1909.—According to the official returns recently issued, the total value of the potato crop of 1909 was £9,921,000.

Importation of Potatoes.—The Department of Agriculture for Ireland have issued an order prohibiting the landing of any potatoes brought from the Continent of Europe. We note also that the Swedish Board of Agriculture have recommended the total prohibition of the importation of potatoes into Sweden.

FORCED SHRUBS AT KEW.

The value of forced shrubs for conservatory decoration in early spring has been, and still is, well exemplified in the Temperate House at Kew, where a variety of showy subjects are stood about among the permanent plants, the evergreen foliage of the latter forming an admirable setting for the various red, yellow, white, or mauve flowered shrubs. Some of the subjects which appealed to one more particularly on a recent visit were Prunus pseudo-cerasus and P. serrulata, with rose-flushed and white flowers respectively; Neviusia alabamensis, a charming and uncommon American shrub, with white, fine-petaled flowers, which in America is called "Snow in Summer," Wistaria chinensis grown as stunted-looking pot plants covered with racemes of lovely mauve flowers; Rhododendron sinense, various deutzias, and spiraeas, etc.

A large structure, such as the one under notice, affords a fine opportunity of introducing good sized bushes, and at one time or another very large well-flowered specimens of Forsythia suspensa, spiraeas of various kinds, double-flowered peaches, diervillas, lilacs, viburnums, and other showy subjects have been noted. Forced shrubs are, however, not relied on to furnish the whole of the floral display, for there are large camellias and many acacias. Of the former a fine example of C. reticulata was a mass of bloom, while many of the latter were at their best when these notes were made.

In one section of the building are many fine Himalayan rhododendrons, which are in flower, whilst for the person who is interested in plants which are almost hardy or suitable for outdoor culture in the southwest counties, no place better repays a visit, for in the structure a very large selection of such plants is to be found.

An elegant hardy shrub, with clusters of snow-white flowers.

USEFUL PLANTS FOR THE CONSERVATORY.

The following subjects are of much value for conservatory decoration, and can be readily raised from seed:

Exacum affine is a showy perennial, producing clusters of small lilac-coloured, sweetly-scented flowers. This is best suited for the conservatory or greenhouse, but in suitable localities, and on warm soils, it may be used as a bedding plant. Cultural treatment should be similar to that recommended for Diascia Barberæ.

Lobelia tenuior is an attractive perennial species, and as a pot plant is very graceful in habit, and for a long period during the summer months it produces a profusion of blue, white, or rose-coloured flowers. The seeds may be sown any time during April or May for summer flowering; greenhouse or cool treatment is all they require.

Petunias have long been attractive favourites, and few plants give better results than these in return for the care bestowed upon them. To obtain strong, healthy plants the seeds should be sown in gentle heat—on a hotbed for preference—during March or April, and the plants kept growing in a temperature of 55 or 60 degrees. Many of the strains now in commerce produce flowers of exquisite beauty, with a remarkably wide range of colours.

Primula sinensis (Chinese primula) and P. s. stellata are of undoubted merit for the conservatory. Seeds of these should be sown in very gentle heat from April to July for autumn and spring flowering. The soil should be made up of loam, leaf-mould, and sand, in about equal parts; some growers add a little peat. Pass the whole through a fine sieve. The pans or pots must be well drained, the soil made moderately firm, and the whole well watered before the seeds are sown; after sowing the seeds should be very lightly covered with fine soil, or clean silver sand, afterwards covering with a square of glass, over which might with advantage be placed a layer of damp moss, as this greatly assists in maintaining an equable degree of moisture, which is a matter of the greatest importance for the successful germination of the seeds, for the slightest error in this respect is absolutely fatal.

Torenias are exceedingly pretty tender perennials, which, if sown and grown in gentle heat, will yield a profusion of purple, yellow, and blue flowers for a long period during the summer and autumn months. Three or five plants should be allowed for a 48-sized pot. An occasional stopping will keep the plants dwarf and compact in habit, and quite dispense with the usual custom of staking.

W. Hedley Warren.

Aston Clinton Gardens.

Quality of Potatoes.—In connection with the trials of potatoes carried out last year under the auspices of the Oxfordshire Education Committee, about fifty varieties were submitted to a cooking test, with a view to determine their relative merits on the table. Of these the following ten varieties were given three marks: Duchess of Cornwall, Evergood, Flourball, Gospetry Red, Ideal, Up-to-Date, Satisfaction, Scotch Champion, The Factor, and White Elephant.

CELERY CULTIVATION.

Few gardens of the present day are without their rows of celery, and even cottagers and allotment cultivators revel in its cultivation; this is not to be wondered at, for there are few other vegetables more relished alike by all classes of society. While the tender and blanched sticks serve as food in an uncooked condition, the green or outer stems, when cleansed, constitute a delicious vegetable when cooked, and one which can be particularly recommended to those who suffer from rheumatism. Celery delights in a light, rich, and somewhat moist soil, and where this is procurable little difficulty is experienced in its cultivation.

Celery is easily raised in heat during the early months of the year, according to whether the heads are required for early use or for exhibition purposes. But as celery does not come into general use until late autumn and winter, there is little necessity for very early sowings, and for general purposes March will be found sufficiently early, while sowings may be made during April on soil which has been specially prepared over decomposed, warm manure. A common mistake is to sow too thickly; if the seed is of the previous year's saving, 90 per cent. can usually be depended upon to germinate. When this mistake is made, the roots of the seedling plants are torn apart, and considerably damaged at the time of pricking out into boxes or in the open ground.

Luckily, the seedling plants withstand a great many hardships, and even when their growth is stunted for some time they will often recover, and go ahead.

The commonest mistake made in the cultivation of celery is that of planting out in deep trenches, the folly of which I have proved by repeated experiments. The practice followed by many who adopt this system is to remove the top soil, and place it on either side of the trench, after which a dressing of manure is forked in to the remaining soil in the trench, and into it, at a later stage, the plants are transplanted. Should this subsoil be of a heavy retentive character, it will not afford that encouragement to root action that would be derived by the plants growing in the top soil. Further, the surface soil has been thoroughly exposed to the atmosphere for some considerable time, and it contains just that amount of available plant food which is essential to the progress of the young plant; to say that the subsoil can afford equal facilities is unreasonable. Should the subsoil be poor, or not mechanically adapted to the encouragement of root action, leave it undisturbed, or, at any rate, prevent it from coming into contact with the seedlings.

In gardens that have been well cultivated for a number of years, and wherein the soil has been trenched from time to time, a trench may be taken out twelve inches wide, and from six to ten inches deep. I have frequently taken out trenches fifteen inches in depth, but have experienced no advantage in doing so, it being much preferable to give width rather than depth in the trenches; further, where double rows of celery are planted, the width of the trench should be increased to eighteen inches. If dwarf varieties of celery are grown this will admit of a treble row. As celery is a somewhat gross feeding plant, it must be provided with a fair amount of nourishment, and this cannot be better done than by incorporating a substantial dressing of well-decomposed farmyard manure with the soil in the bottom of the trench a fortnight previous to planting.

Lift the plants carefully from the nursery bed or from boxes, preserving as much soil around the roots as possible; plant by means of a trowel, and, if in single rows, allow from eight to nine inches between the plants. If in double rows, arrange alternately, as by so doing each plant will have a better leaf area. Place the soil firmly around the roots, and if it has any tendency to hollowness as a result of the use of light manure, tread it firmly during the planting process. A good watering will complete the operation, except for very tender plants; for the latter it will be advisable to shade for a day or two.

The after-cultivation of celery consists of feeding with manurial stimulants, and carefully earthing up with soil, or in some other manner blanching the stems until they are in a fit condition for cutting. If grown in a cold, heavy, and clammy soil, the plants will not make a good start, and no amount of manurial stimulant will induce them to do so; this is where many crops growing in a bad subsoil are ruined. Liquid manure must be given judiciously, and in keeping with the progress that is made throughout the growing season; it should never be given in strong doses. If drainings from a farmyard or pigstye are available, these may be given with advantage twice a week, but during wet weather it should be withheld, as its application to soil that is already waterlogged tends to increase sourness. If the surface of the soil in the trench shows signs of becoming caked over, due either to the running together of the soil particles, owing to heavy rains, or to the application of liquid manurial stimulants, it must be forked over in order that it may admit abundance of air to the roots, otherwise the growth will not be strong.

In soils that are naturally dry celery can never be grown profitably, and the plants are very subject to bolting, while on the other hand, if cultivated in swampy soils containing a rich deposit of humus, it invariably grows too rank, the stems becoming soft and pithy.

It sometimes happens in growing celery for exhibition that the feeding is continued after the earthing up has been done; this is accomplished by placing pipes through the soil. Through these pipes the liquid stimulant is poured. Where drainings from farmyards cannot be obtained, a very suitable liquid manure for celery may be obtained by soaking farmyard manure in water, or by using guano in a similar manner. Soot water given in moderate doses is also valuable.

As the season advances and good growth has been made, blanching should commence. First remove any side growths which may have been developed, then tie up the stems with string, bass, or other soft material, and earth up only when the soil is dry, taking care that as little of it as possible is allowed to enter the heart of the plant. As a considerable amount of growth has to be made, the foliage and upper parts of the stems must be well exposed to light and air. At a later stage a second tying nearer the top should be made, and the soil worked still higher, until finally, when the foliage is no longer fitted to carry on the work of the plant, earthing up is completed, nothing remaining above the soil except a few of the more prominent leaves. In performing this work, the soil must be thrown up so that water which falls upon it may pass easily through, and is drained below the stem of the plant. If heavy soil is thrown up againts the stems, the water which passes through it has no means of draining away from them, and, as a consequence, the heart soon commences to rot. The crop should be ready for the first earthing up about three months after planting, and the soil should not reach more than halfway up the stems. In all three earthings should prove sufficient, and these will usually follow at intervals of from two to three weeks.

In some seasons celery is seriously injured by the maggots of the celery fly, as indicated by white greyish-coloured patches on the leaves; on closer examination these patches reveal the insect embedded between the upper and lower surfaces of the leaves. These should be at once removed by nipping out the foliage so affected, placing same in a pail, and burning. If the rows are systematically picked over in this way attacks can often be checked to a considerable extent, especially if afterwards the plants are given an occasional sprinkling of fresh soot. This, however, is best performed in the month of June, when the flies commence to deposit their eggs. The fly, which is found present in large numbers in May and throughout June, is only about an eighth of an inch in length, and infested leaves may be found from the time the celery is planted out until Christmas. In about fourteen days the larvæ changes to pupæ, and remain in the soil in that state during winter; if the soil is then turned up these pupæ may be found in considerable numbers. It is therefore advisable to skim off and burn some of the surface soil, or, as an alternative, to trench it deeply in winter after the celery has been consumed. Gas lime is also effective when the ground is not required for cultivation for several months after its application.

Old Basing. J. C. Newsham.

BEGONIA GLOIRE DE SCEAUX

This beautiful begonia has much to recommend it to the notice of cultivators. Its large rich bronze foliage alone is sufficient to secure for it many admirers, but, when in winter and early spring it is laden with its showy pink flowers, its decorative value is more fully demonstrated. Nice plants may be grown in comparatively small pots. I have found those grown in 5in. and 6in. pots to be the most serviceable, while for larger specimens 7in. or even 8in. pots are not too large.

A mixture consisting of two parts turfy loam and one part leaf-soil and peat in equal proportions, with a good sprinkling of sand, will form a suitable compost. Cuttings should be taken from the old plants immediately after flowering, and inserted in pots or pans of sandy soil, and placed in a close, but not a specially moist, propagating case. When rooted put them singly in 3in. pots, and place them in a light position in a structure in which a temperature ranging between 65 and 70 degrees is maintained; repot before they become pot-bound, and if bushy plants are required pinch out the point of the growth about a week or ten days previous to potting, but for plants in 5in. pots no pinching is needed. Shade from bright sunshine is required, and the space between the pots should be syringed on all bright days, but overhead syringing must be avoided. The flowering period may be considerably lengthened by removing the plants to a slightly cooler house as soon as the flowers expand.

APPLE SUCKER.

All who have apple trees in their charge must now be up and doing to combat the dreaded apple sucker, which, in many cases, is doing far more damage than any spring frost.

The writer has been examining the eggs on the apple twigs almost daily for the past ten days or so, and at last the first of them has started to hatch. By some mysterious working of the laws of Nature the eggs seem to hatch first on those trees which are most forward in their development towards bursting into bloom. The first observed were upon Frogmore Prolific, and a day or so after upon Ecklinville Seedling, but not one has at present been found hatched out on such late-flowering varieties as Jubilee.

The flat, dark brown larvæ are already making their way up to the opening buds, and, where the latter are sufficiently open, working their way into them to feed on the tender green leaves. A keen watch must be kept, examining the twigs and spurs with a pocket lens in order to select the precise moment when a good proportion of the insects are hatched, in order to give a thoroughly good spraying before the bloom opens. Any of the summer sprays intended for sucking insects will make a clean sweep of them, a good soft soap and quassia wash even being sufficient, provided enough force is used, combined with skill in directing the spray to reach the insect. The task of killing them is very much easier during the first few days of their life, if it can be accomplished then, before the peculiar oily globule appears, which materially assists the insect by throwing off the spray fluid, and so protecting it from destruction. In cases of very bad infection the truss of bloom is quite glued up together with this sticky mess, so that it quite fails to split up into its separate flowers, each with its clean stalk, as the grower would wish, but remains a stunted mass, of which no single flower can be expected to set and produce a fruit. Even with those which do apparently open properly, in cases of bad sucker attack, the effect of many of the insects sucking at the flower stalk seems to wither it away completely, and it drops off, though apparently healthy in all other respects.

Spraying with the various summer spray fluids may be continued till the bloom opens, but only one, as far as the writer's experience goes, can be used with absolute safety after the tree is in full bloom, namely, tobacco extract. This has been used for two seasons now on thousands of trees in full bloom, without the slightest trace of any harmful effects. The chief drawback to this latter procedure is that the petals, particularly of the bolder-flowered varieties, such as Warner's King and Stirling Castle, prevent the fluid going just where one wants it, namely, into the junction of the flower stalks, where the sucker delights to take up its abode and entrench itself.

I have refrained from giving the life history of this pest, because it has already been given in these columns, only giving these few notes to urge all who are trying to grow apples, whether in a large or small way, in private gardens or in market orchards, to be very energetic now before it is too late, and use every endeavour to save and safeguard their crops.

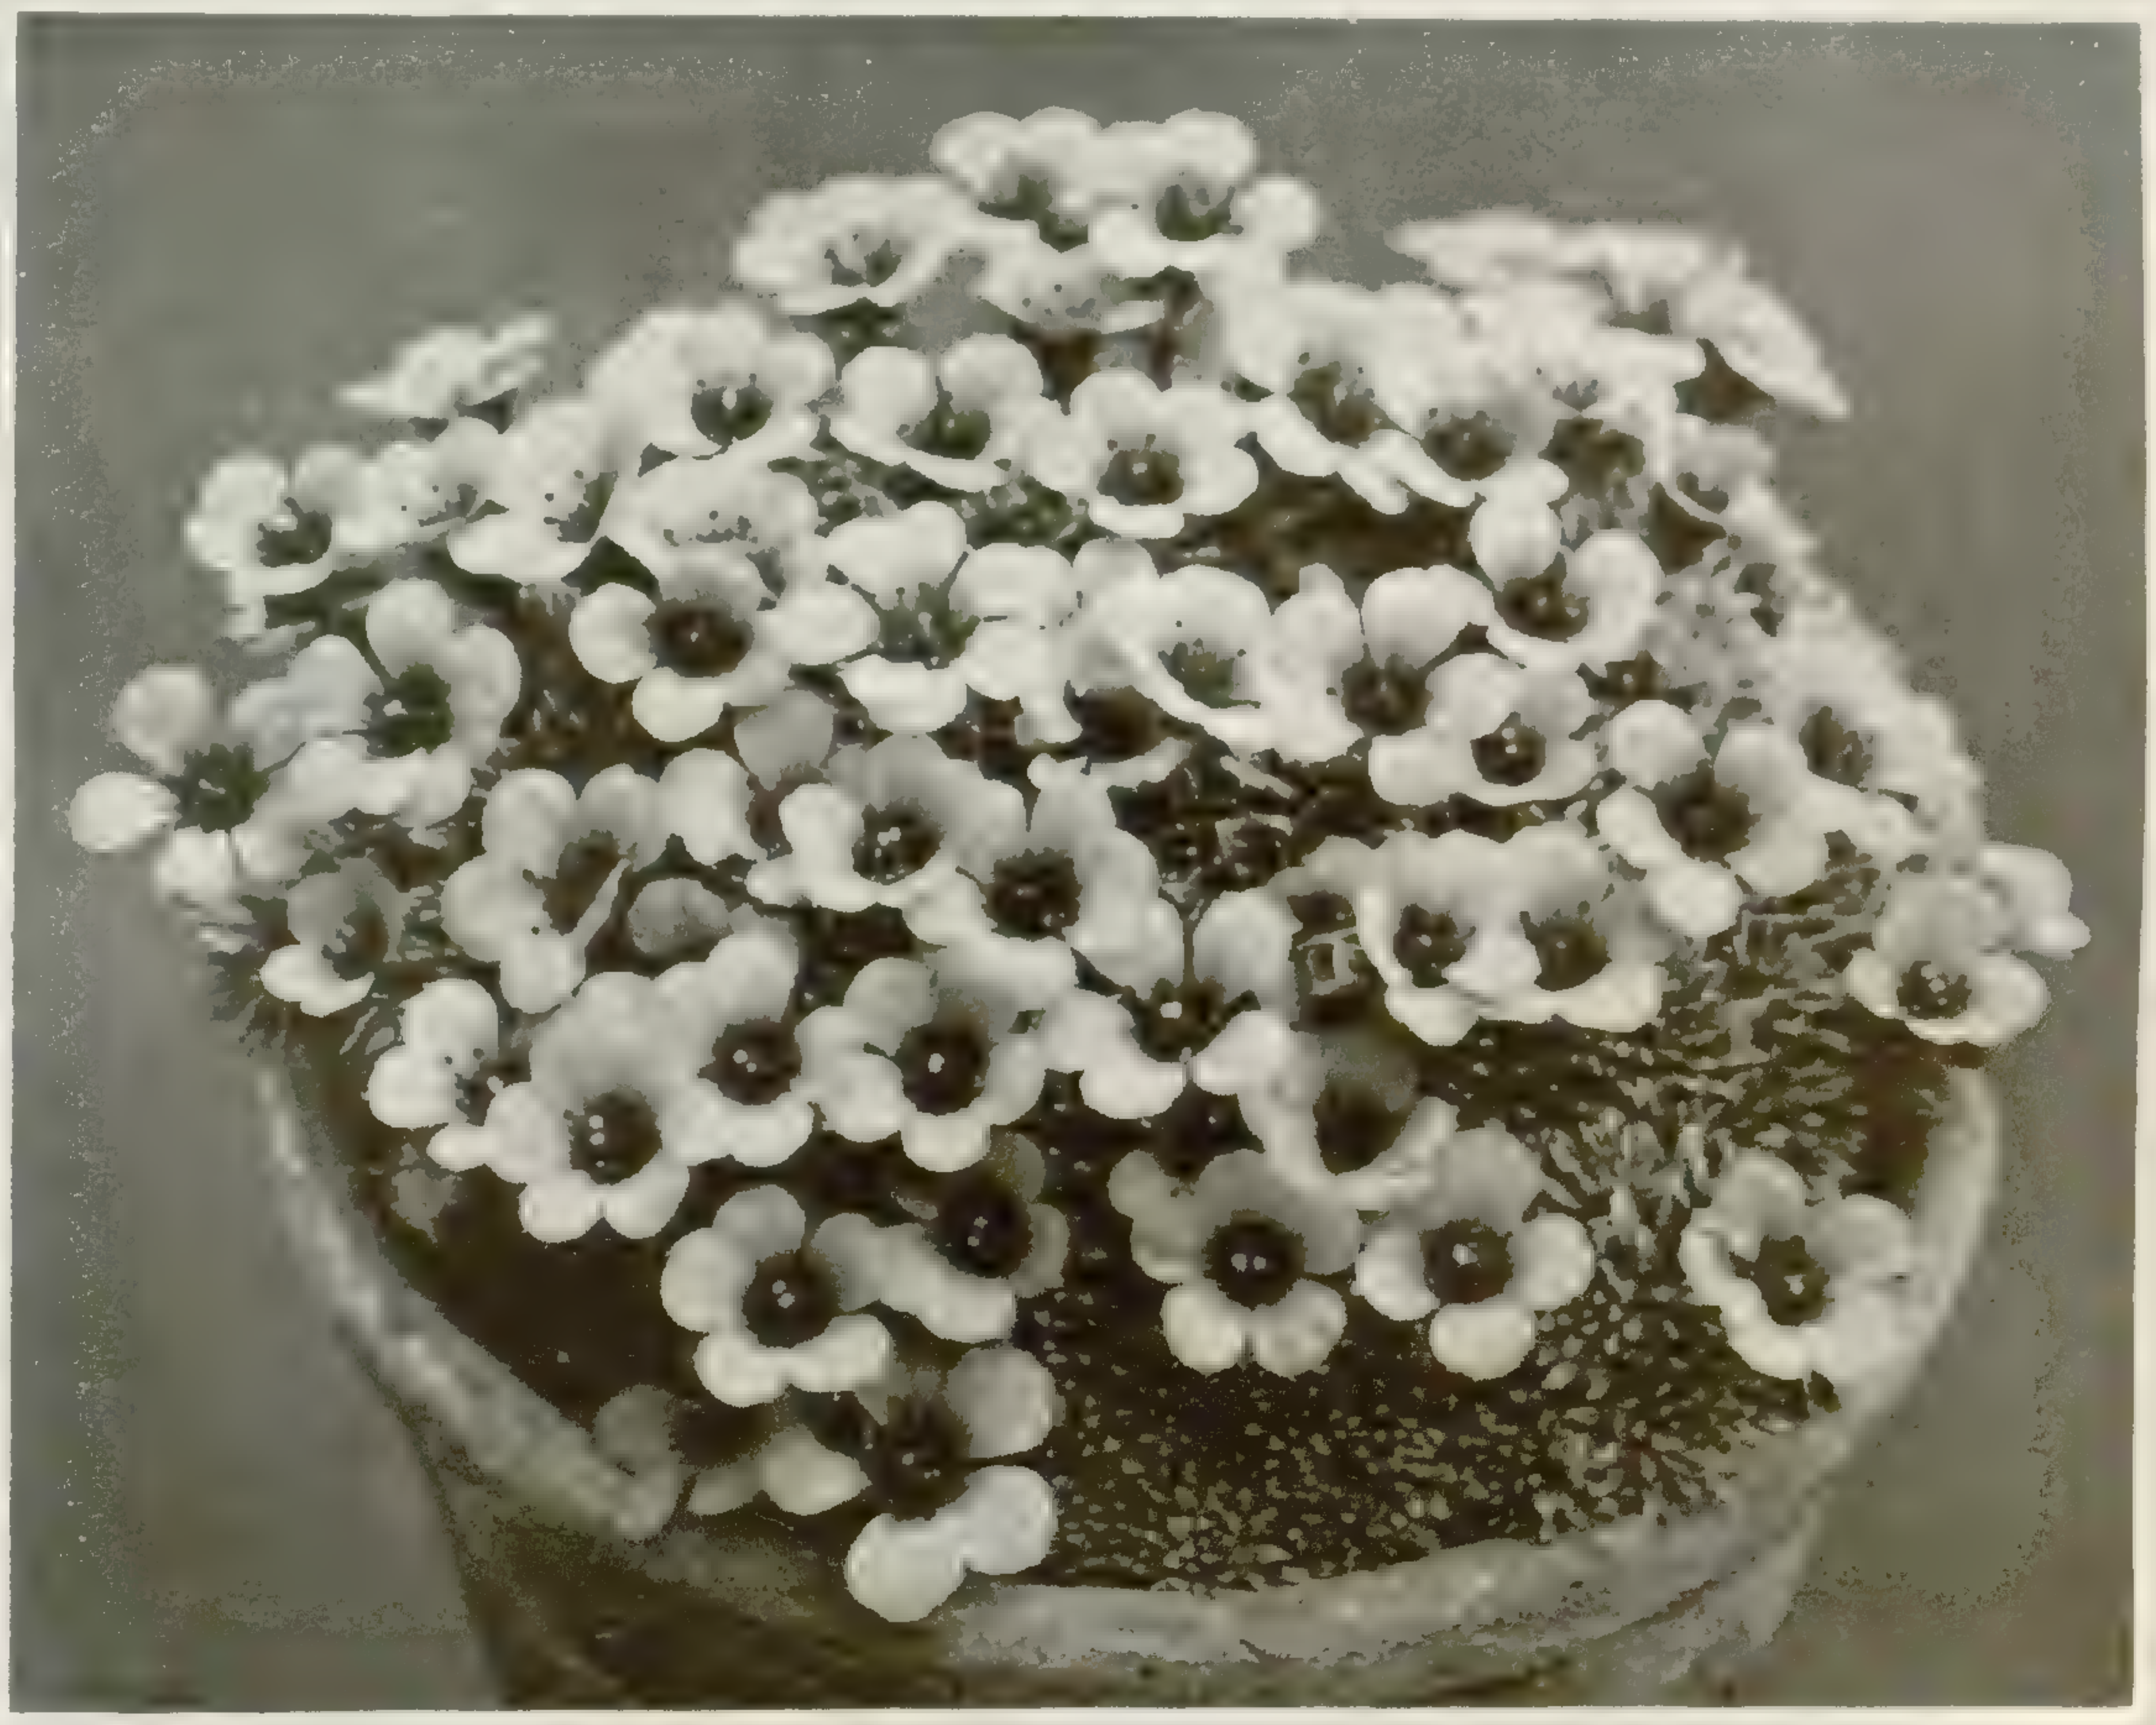
Above all should those be on their guard who grow Ecklinville Seedling, which is one of the varieties most likely to be infested by this terrible little insect. Such a spraying given now will also destroy numbers of the apple aphis, whose dark green larvæ are to be seen, in many cases, in the same buds as the sucker, and so prevent the trees being infested with the countless hordes of progeny which these first apterous viviparous females produce.

F. W. Hammond.

Pilgrims Hatch.

BOYD'S SAXIFRAGE.

The finely-flowered example of Saxifraga Boydi that we have the pleasure of illustrating herewith is one of the many beautiful alpine plants that are grown with so much success by Mr. J. Grandfield, the able gardener at Hayes Place, Beckenham, the residence of Sir Everard Hambro. Under any circumstances, the illustration would be of interest, as evidence of the beauty of this charming hybrid; but in this case it is especially interesting because the plant is what is known in the technicalities of horticulture as a poor doer. As Mr. Arnott has pointed out in these pages on several occasions, it grows much more vigorously under the influence of the cool summers of the north than it does in the south, hence the production of so fine an example at Hayes Place does much credit to Mr. Grandfield's cultural skill. Saxifraga Boydi was raised some years ago by Mr. James Boyd, Cherrytrees, Roxburghshire, from a cross effected between S. Burseriana and S. aretioides primulina, and the flowers are soft yellow. It requires a cool situation, and to be carefully top-dressed, the peat and sand being worked among the rosettes to prevent the plants becoming brown.



A FINELY-FLOWERED EXAMPLE OF SAXIFRAGA BOYDI.
Grown by Mr. J. Grandfield, Hayes Place Gardens. Flowers, soft yellow.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ALYSSUM SAXATILE COMPACTUM.

This now well-known plant differs little from the older Alyssum saxatile, its varietal name denoting such difference as exists. It is as essential to the garden in spring as arabis and aubrietia, with the latter of which it makes a specially fine combination. Though primarily a rock plant, it will grow anywhere, but the soft growth induced on a rich damp soil sometimes succumbs to a severe or excessively damp winter, especially if it is in a shady place. Next to rockwork, which most nearly approaches the native habitat of the species, it does best in fairly dry places, where it gets plenty of sun. It comes true from seed, which, if sown in April or May, produces fine plants by the autumn, and these will flower well in the spring following. Being tap-rooted it resents moving more than most spring flowers, and it is better to put it in its flowering quarters in the autumn. Cuttings may be taken about flowering time, or soon after, though they do not strike so readily as many things, and they will make smaller and more compact flowering plants than the seedlings.

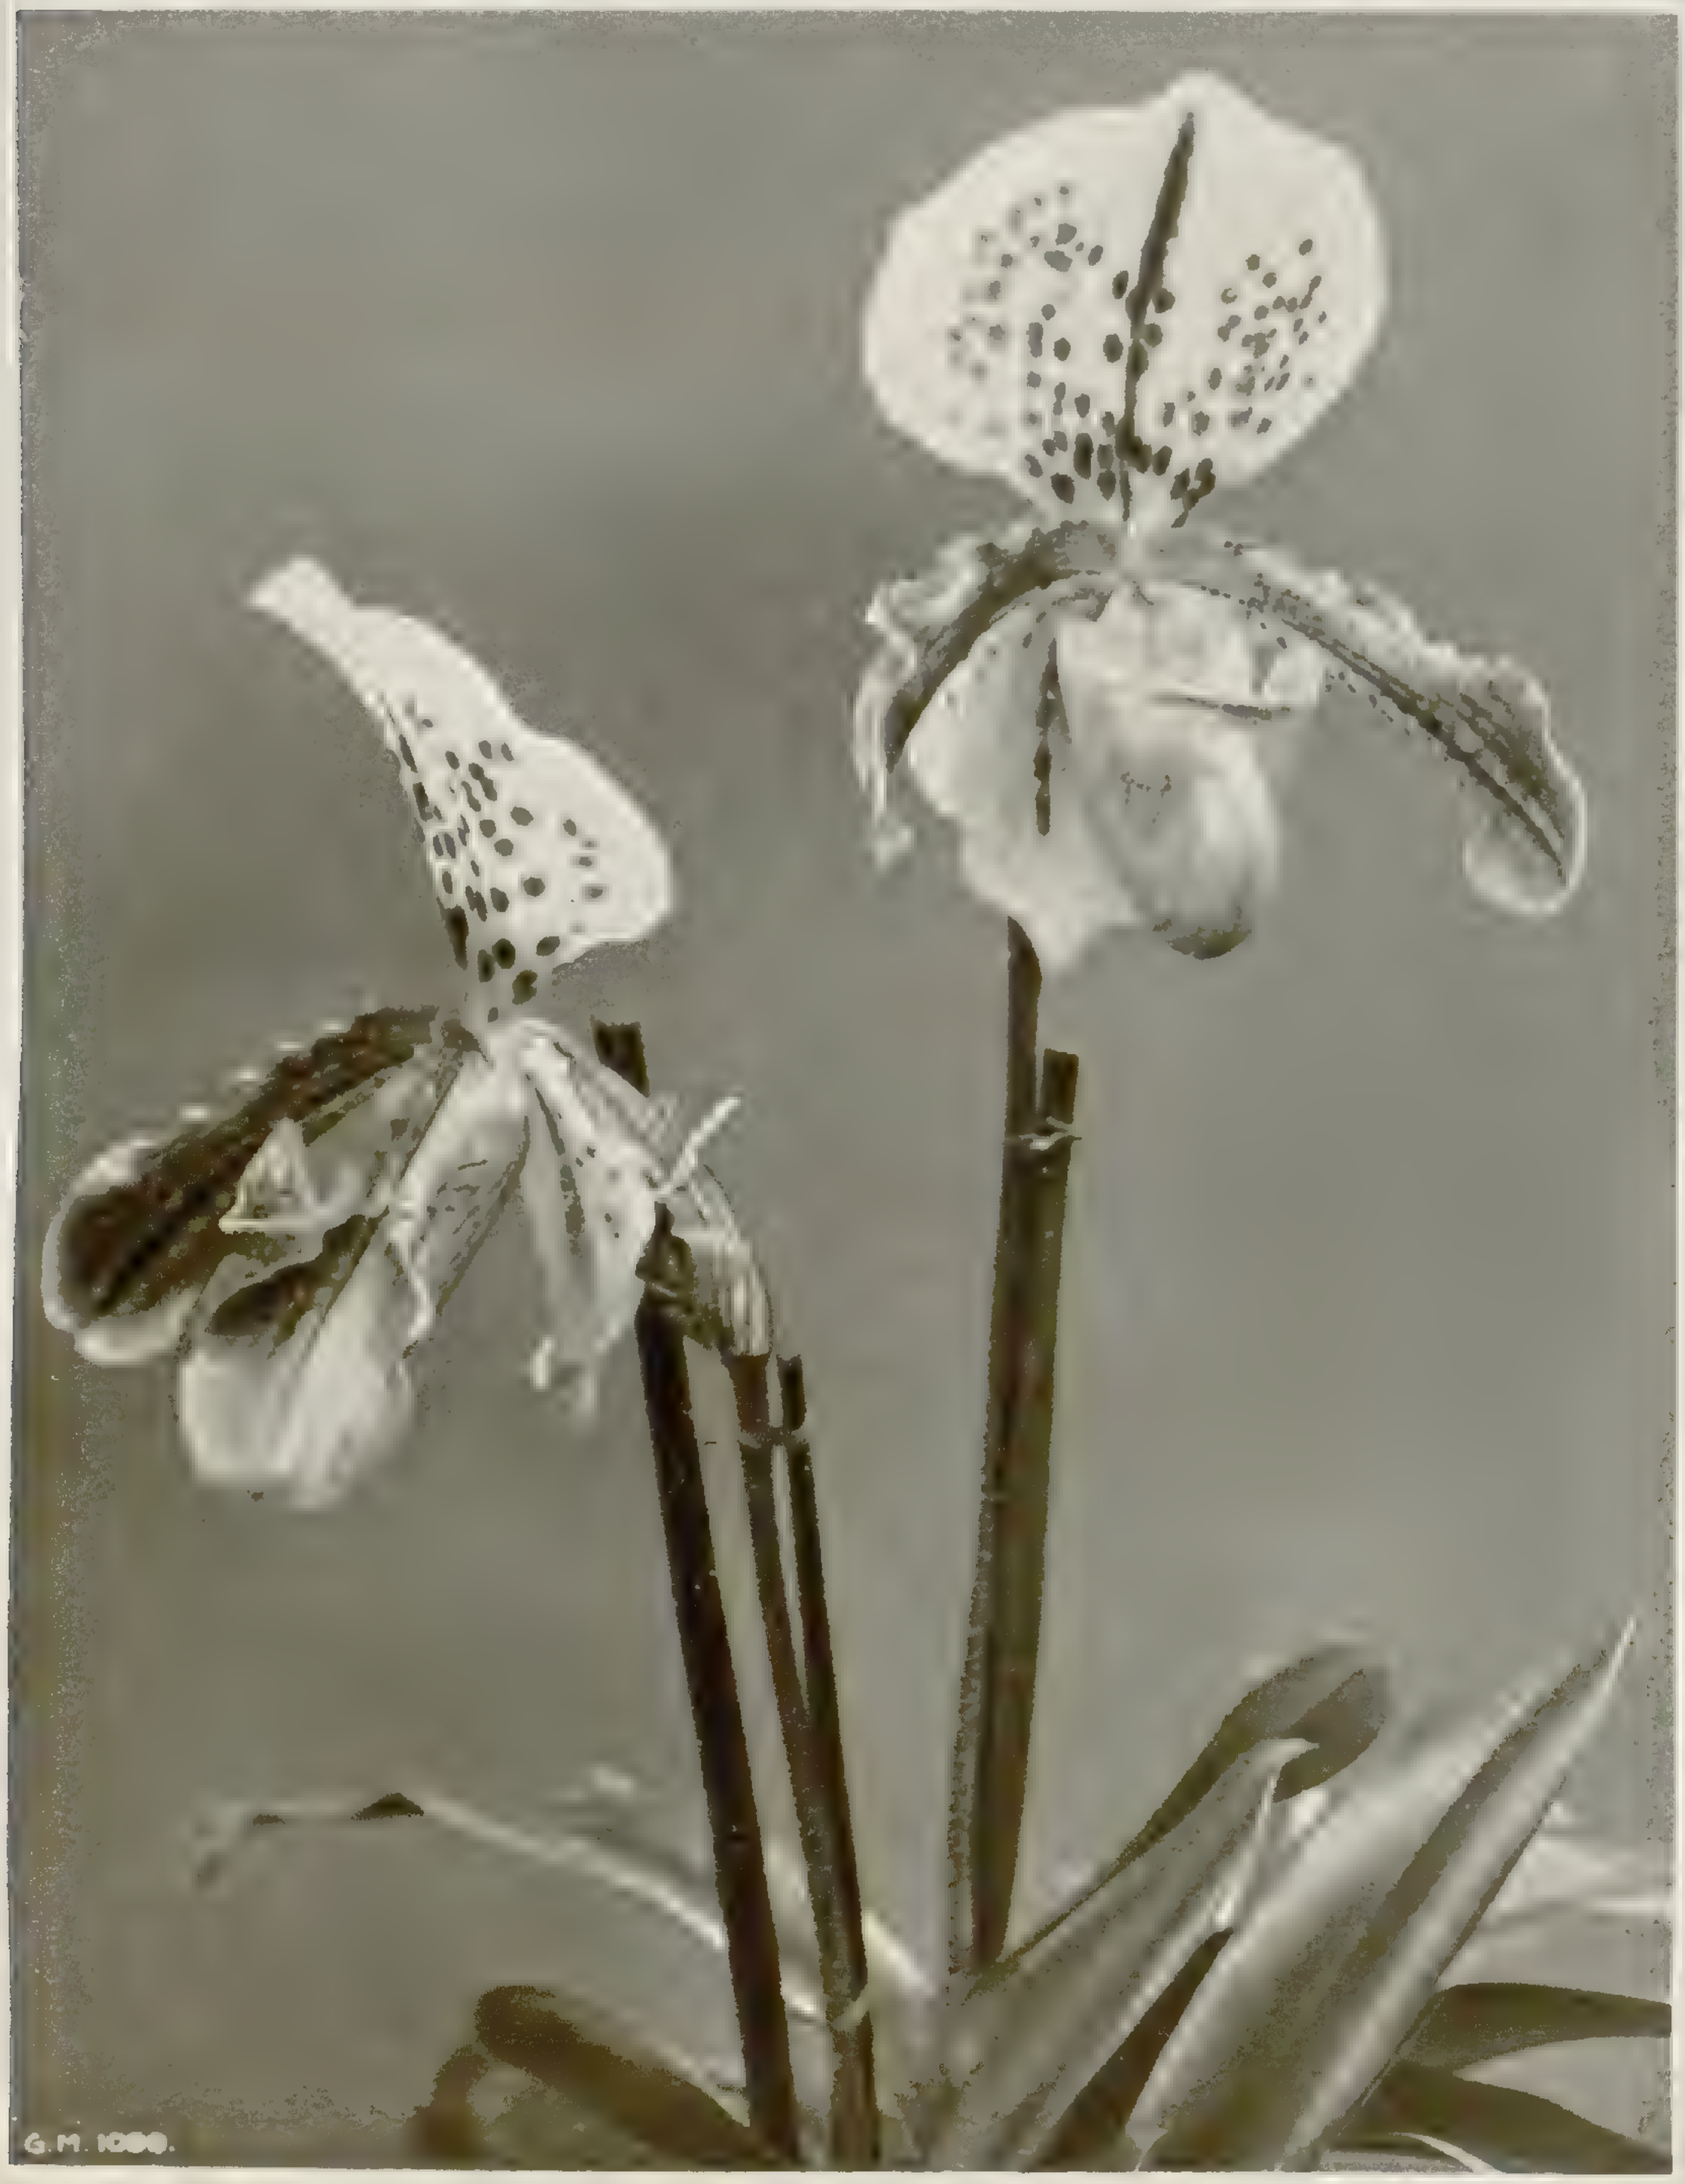
The main thing against this alyssum is the short duration of its flowering time, rarely so long as three weeks. It may be used either as an edging for mixed borders, or for spring bedding in any form, either with other plants, like aubrietia, myosotis, silene, etc., on equal terms, or as a surfacing plant for the taller and later-flowering tulips, the effect of tall scarlet and gold tulips rising out of a sea of this golden alyssum being very fine, the growth, when flowering, being sufficiently high to prevent its being unduly smothered by the broad leaves of the tulips. When used for spring bedding it is not worth while keeping the plants for another year, as new seedlings are much better for the purpose.

Alger Petts

MILTONIA VEXILLARIA.

Introduced to this country about the year 1867 from South America, this lovely orchid was for many years classed as an odontoglossum. The name vexillaria is from vexillum, literally a standard or flag, and I suppose it was applied because of the very large and flat flowers. A better name could not have been found, for the flowers resemble a series of flags unfolded.

Though it is such a very beautiful orchid—indeed, even a small collection would not be anything like complete unless it comprised several examples—its successful culture is not at present thoroughly understood, if we must judge by the very miserable specimens we often see even in gardens in which there is an endeavour to grow orchids.



CYPRIPEDIUM HERA VAR. EURYADES.
Flowers white and purple, green and brown.

To the beginner I say do not be dismayed if your miltonias are not very vigorous, even if they grow less instead of larger. Others have had the same experience before, and they undoubtedly will again. In our case, we have given, perhaps, more serious thought and consideration to this orchid than to any other we grow. Thirty years ago it was our aim and object to grow all the orchids we could into large specimens; immense pans of Cœlogyne cristata, great masses of Dendrobium nobile, very large examples of Cattleya Mossiæ, giant examples of Cymbidium Lowianum, etc., etc., and in these cases much success followed our efforts, but with Miltonia vexillaria this system ended in disaster. Up to certain limits of size, all went well, and we had splendid examples in 7in. pots. So well did these that the flowers cut from them in 1886 were lovely, and made that year quite memorable, as they provided such grand additions to boxes of orchids we sent away and also for decorative purposes at home. We transferred some of the plants to 9in. and 10in. pots, and they began to decline, but we noticed the plants in small pots continued healthy and strong.

We clung tenaciously to the plan of trying to grow a few into large examples, but as years have rolled on we have found from continued experience that small examples succeed best. We have very few now in 7in. pots, as we find very good examples can be grown in the 5in. and 6in. size.

I am strengthened in this opinion by the advice I recently had from a very large grower of this orchid, and the advice was to grow each growth separately, and be content with small, vigorous plants. With regard to the time of division and repotting we find that after a period of resting, extending through June and July, about the first week in August is a good time to divide and repot, as then the plants become fairly established before winter sets in.

The compost should be good fibrous peat, with all fine particles sifted out, good large-headed sphagnum moss, well chopped up, very finely broken bricks, crocks, and charcoal. We are now feeling our way with a little osmunda fibre, and a small quantity of polypodium fibre intermixed with the peat and moss, but we cannot give a very decided opinion yet as to whether the addition is beneficial or otherwise.

The safest way is to repot into a light, porous compost, and cover the top with about half an inch of live sphagnum moss, which encourages the surface roots, and the condition of the moss will indicate when water is required. The importance of the healthy surface of live sphagnum cannot be overestimated, as I have found that all the roots of bought specimens of Mitonia Bleuana have been in this top layer of sphagnum; these were evidently potted on the Continent as they were not in English-made pots, and the pots were three parts filled with a sandy mixture of leaf-mould, but this mixture had not one root in it.

We find the best place to grow Miltonia vexillaria is the cool end of a cattleya house, as it is an orchid that will not succeed in a low temperature. With regard especially to this orchid, my advice is to keep every specimen well within the line of vision, do not put them in remote corners, out of the way. If neglected yellow thrips will almost devour them, or they will be damping off or be scorched before we know it. We suspend some plants from the roof and we grow some on the stages; they do equally well in either position, but they are all well in view. We have several times experimented with single specimens in cooler houses, but after much observation we find the temperature of a cattleya house suits them best.

Cheshire. W. M.

CYPRIPEDIUM HERA VAR. EURYADES.

The fine old Cypripedium Boxalli crossed with the hybrid C. Leeanum has produced a hybrid that is unusually variable, but which, in its finer forms is a remarkably useful and handsome plant. It flowers during the winter months, and quite frequently produces two flowers on one stem. The clear white of the upper part of the dorsal sepal is a feature, while the rich purple spots and shading and the burnished brown and green of the petals and lip help to make up a most attractive flower. The original hybrid was raised by Messrs. James Veitch and Sons, Chelsea, and first flowered in 1892, and described as C. Hera. The variety Euryades appeared a year later, and, as a general rule, it is finer than C. Hera, and in more recent times, owing to the use of very fine forms of C. Leeanum as one parent, the seedlings have more nearly approximated to C. Euryades than to C. Hera, so that the latter title has largely fallen into disuse. The accompanying illustration represents a very fine form of C. Hera var. Euryades exhibited a month or two ago by Messrs. James Veitch and Sons, Chelsea. In this form, the white dorsal sepal had a medium band and distinct spots of deep and rich purple, and a greenish base; the petals and lip were yellowish-green, veined with brown, and shaded with purple, and had a beautifully polished or highly glazed appearance. The hybrid is easily grown with C. Leeanum and other cool cypripediums, and should be cultivated wherever winter flowers are in demand. C. Adrastus is another varietal form of C. Hera, and is the result of a reverse cross.

THINNING HARDY FRUITS.

I dare say many readers of the Gardeners' Magazine have noticed certain apple and pear trees in their gardens have borne heavy crops in alternate years, and not any in intervening ones. Furthermore, no doubt, it has been observed that the trees in question did not make much growth.

In the gardens of which I first took charge there were two apple trees which fruited well in alternate years. The weather conditions could not have had any influence upon them, as while one specimen was bearing freely the other was barren. This went on for seven years, and at the end of that time there was not any perceptible increase in the size of the trees. Pruning was not necessary, as young wood was produced only in very small quantity. I purposely refrained from interfering with the trees as I wished to see how they would behave. This watching first commenced nearly twenty-five years ago; but I left to take charge of larger gardens at the end of seven years. However, I lately saw the two trees, and, after such a long time, found them not much bigger, and, I am told, they continue to yield fruit in alternate years.

When I took charge of the larger gardens referred to, I found in one part of the garden a long row of pyramid-shaped pear trees. Some were twenty-five feet high, others were about six feet, though all had been planted at the same time, I believe. Of course, I suspected the reason of the stunted appearance of these dwarfs, and found that they were overloaded with pears every other year, and had only a few in intervening seasons. The bark of the main branches was extremely hard, and cracked in all directions; in fact, the bark resembled dry chips.

I removed every flower from the trees in their full bearing season, as well as in the intervening ones, for two or three years, and fed the trees liberally. In this way a fair amount of new wood was made, but after so many years the trees seemed to be too old to make satisfactory growth. No doubt there was something wrong with the stock, too, as all were grown on the quince.

My main point in this note is this, that the timely thinning out of the small fruits on young trees should be very carefully attended to. The free-growing condition, or otherwise, of the trees must be taken into due consideration as a guide to the amount of thinning necessary, so as to build up fruitful and remunerative specimens. Small, unduly stunted trees cannot be very remunerative. Of course, some varieties are much more free in growth than others, and it is a difficult matter to bring them into a good fruit-bearing state while young.

I commend these points to inexperienced cultivators, and I would much like to have the views of others on them.

George Garner.

Asparagus.—Sow seeds at the present time in rows at one foot apart on a well-prepared border, as this is far preferable to sowing on the permanent bed, and plants of uniform size and vigour can be selected for planting into permanent quarters 12 months hence. Another plan which recommends itself is to sow seeds single in 60-sized pots in cold frames; if well attended to during their growing season, occasionally supplied with liquid manure water, and finally plunged in ashes for the winter, very fine planting crowns will be the result.—G. Ellwood.

A PLANTATION OF GIANT YELLOW POLYANTHUSES IN THE SEMI-WILD GARDEN.

POLYANTHUSES.

When grown under conditions favourable to their full development, the polyanthuses bloom so profusely as to produce colour effects of such richness and beauty as to justify their charms being referred to at some length. But these notes are intended to be of an essentially practical character, and therefore all that will be said in their praise will be to suggest that many gardens, both great and small, would have their attractions in spring greatly increased were these delightful flowers more largely and systematically cultivated.

In the case of polyanthuses, as of so many other classes of plants used in beautifying the flower garden, it is of importance to begin well; and to begin well with the polyanthuses or bunch primroses is to obtain seed that has been saved from a good strain. There is no difficulty in doing this, for seed that will produce plants of a high degree of excellence is plentiful. The purchaser has simply to refer to the seed catalogue of one of the many good firms that advertise in the Gardeners' Magazine, and order the best seed that the firm offers. Those who require polyanthuses for massing in beds and borders or for the formation of large breadths in semi-wild gardens, should order the seed in separate colours, as these are far more effective than mixtures. The best types for these purposes are those generally known as the Giant Crimson, Giant Yellow, and Giant White. When a few plants only are required for planting along the front of the mixed border, a strain of fancies will afford much pleasure to those who have a taste for mixed colours. There will be some variation in the colours of the flowers of plants raised from seed sold in selected colours, as it is practically impossible to ensure every one true to colour, but the variation will not be sufficient to appreciably detract from the general effect.

A rather long season of growth is necessary to ensure strong plants by the autumn, and therefore it is necessary to sow the seeds not later than the end of April. An excellent method of procedure is to sow the seeds thinly in shallow boxes that are filled with a mixture consisting of light loam, leaf-mould, and sand. This should be made rather firm and quite level previous to sowing, and when the seeds have been regularly distributed over the surface they should be thinly covered with fine soil. The boxes should then be removed to an unheated pit or frame, and have paper laid over them to prevent the surface drying quickly. If this is done, and the lights kept closed until the seedlings are making their appearance above the surface, the seeds will germinate quickly, and the seedlings commence to grow away freely. It need hardly be said that the soil must be maintained in a moderately moist state, and that the papers should be removed when watering is being done. Gradually harden off as soon as the seedlings are so far advanced as to show signs of crowding, plant them out on a shady border, one on the north side of a wall being preferable. In its preparation, the border should receive a liberal addition of leaf-mould or other decayed vegetable matter, and the plants be put in four inches apart in rows, with ten-inch spaces between them. Well watering them in will follow as a matter of course; but it may be useful to point out that overhead waterings in the evening during periods of dry weather will be of immense assistance in promoting a vigorous growth.

Polyanthuses can be readily increased by division, which should be done late in spring, when the plants are removed from the beds and borders in which they have bloomed. Promptitude when taking them from the beds is essential to success, and immediately they are lifted pull the plants to pieces, each piece having two or three crowns, and plant in a shady border. From this stage give them the attention suggested for seedlings, being particularly careful to avoid neglect in watering or overhead sprinklings. October is the best month in which to transfer polyanthuses to the beds and borders in which they are to bloom, and also to form plantations in the semi-wild garden, such, for example, as the one herewith illustrated.

W.

Forestry Exhibition at Liverpool.—In addition to the great flower show that will be held in conjunction with the Royal Agricultural Society's exhibition from June 21 to 25, there will be a forestry exhibition. There will be fourteen sections, and silver and bronze medals will be offered in them. There will be classes for specimens showing the beneficial effects of pruning when well done, and its injurious effects when badly done. There will be classes for different descriptions of gates for farm and estate use and a new class for fencing open to all tradesmen and estate workmen, professional and amateur. The competition instituted last year for plantations will be continued, the area this year being Lancashire, Cheshire, and N. Wales. Gold, silver, and bronze medals are offered for the best plantations, and prizes will also be offered for home nurseries. The entries for the plantation and home nurseries competitions will close on Saturday, April 30, and the entries for the Forestry Exhibition in the showyard at Liverpool on May 20.

MONTBRETIAS.

It frequently happens in the planting of montbretias that the culturist confines himself to one or two varieties, which are made to do service for the whole garden. This idea is well enough if one has to make big colour sweeps, or a massed display. The free use of the ever-popular Crocosmiæflora has tended to keep other varieties in the background, but with the introduction of the Westwick varieties, raised by Mr. Davison, a fillip has been given to montbretia culture in general, and novelties of recent years will soon share in the bestowal of favour.

Treated as hardy perennials, and dividing the masses of bulbs as frequently as may be required, the montbretias are of great service for garden decoration and for cutting. One can include them in so many schemes of garden adornment, in the borders, in especial beds upon the grass, grouped near the streams in the water garden, and upon the slopes and banks of the wild garden; indeed, there are many situations where the montbretias are desirable, and, as a rule, little or no difficulty is experienced in their culture.

A well worked, fairly rich, retentive soil is necessary for good results; poor and dry land giving but poor returns. A good dressing of farmyard manure should be given to the ground some time before planting, and thoroughly incorporated with the soil, and if the latter is inclined to clay, then sand or road grit can be added with benefit. It must be borne in mind that annual lifting and transplanting of existing clumps of montbretias will materially assist in the production of splendid growth and blossom. I have noted grand results from late autumn transplantings, and would advocate this measure whenever possible, though I admit that spring planting, from the end of March and in April, is not without advantage in many cases.

The newer montbretias show marked advances upon the older varieties. The Westwick novelties are becoming pretty well known, and some of them, such as Prometheus, George Davison, etc., should by now be enjoying a wide range of culture. Prometheus is of grand size, but I care little for the colouring, and the rich orange-scarlet of Lord Nelson, or the golden-yellow of King Edmund, are, to my mind, far more attractive. Hereward is of much value, owing to its lateness and freedom. Its blossoms partake of the character of Martagon (a Continental form with recurving petals), but do not possess quite so deep a colour as that variety. Lady Hamilton and St. Botolph are both deserving of note, giving shades of golden-yellow, while Norvic, with its free habit, and red-stained blossoms, and Pageant, are deserving of special attention. Westwick is useful, and its orange-red and yellow colouring and maroon markings, give it quite a distinct appearance.

Continental varieties lack something in size, compared with some of the foregoing, but in the matter of colouring they are exceedingly noteworthy. Germania is, of course, still popular, and gives a fine bit of colour, and a quite desirable tone, which combines warmth and richness. Pleasing, too, is Messidor, a delightful pale creamy-yellow, of good size, and wonderful freedom, while Lutetia gives a bright effective display of rich red blossoms. Aureole is good for a yellow, and its clear colour is heightened by the ring of bronzy-purple near the centre of the blossoms. Vulcan, again, is good, being a deep red, with a yellow centre and purplish spots. Vesuvé and Etna speak of fire, and are fine new bright yellow forms. Fire King is exceedingly floriferous, and grandly coloured with rich crimson: it is a notable telling variety. Duchess of Mecklenburg, with its tall growth and bright orange blossoms, may be preferred to the old favourite Crocosmiæflora, while America, a dark orange-yellow with a red centre, and Fantasie, a good vermilion with a yellow centre, are worthy of a place in most gardens.

Others worthy of note are the bright red and yellow Oriflamme; the vigorous yellow Gold Mine, with its reddish flushings; Eclatante, carmine-red, with yellow base; the yellow-throated vermilion Transcendant; the pretty pink Rosea, the double orange flore-pleno, and the blood-red and yellow, with purple tips, of Etincelante. Tragedie may appeal to some flower lovers, but to me this aptly-named variety, though finely formed, represents a combination of colour which cannot well be placed against clearer-coloured forms.

Montbretias, by their richness of colouring, intense freedom, and graceful beauty are essentially fitted for garden adornment, and should be fully utilised.

P. S. HAYWARD.

ASPARAGUS.

Asparagus is one of the choicest of vegetables, but, unfortunately, it is often regarded as the most difficult one to produce. In some localities this doubtless is so, especially if some extra provision is not made in the preparation of the beds, and necessary care, especially for the first few years, is not bestowed upon them.

Asparagus is held in such high esteem that its season should be prolonged as much as possible, and luckily it responds to forcing very well. Some establishments possess a house built for the purpose of forcing asparagus, but a frame will produce equally as good results, providing the hotbed is properly formed and attended to. A mixture of oak or beech leaves and long stable litter should be built up firmly, and when this has settled and the fierce heat declined, a little covering of three or four inches of fine light soil should be placed thereon.

Strong crowns must be procured, and if these are not available from the open beds, it is good policy to procure them from a reliable grower who caters for the purpose. Just cover these with similar soil, and water in with tepid water. A warm, humid atmosphere is required, and a temperature of about 60 or 65 degrees will do admirably. If frames are employed effective means must be taken to keep frost out.

In the earliest days of winter steps may be taken to produce supplies of this vegetable, and if beds are made at varying intervals and replanted as soon as exhausted, a succession may be maintained. New linings of manure, if added occasionally to the hotbeds, will promote greater warmth. The spent roots are of no further use, and should be thrown away.

When the formation of outdoor plantations is under consideration it should be remembered that these will probably remain for a long number of years if properly made, therefore this work should not be hurried over or done in a slipshod manner. The ideal soil for asparagus is good loam well drained, and in a warm position. Therefore choose an open space, well away from large trees, and work the ground in the winter months by thoroughly trenching it, and adding liberal supplies of good farmyard manure, lime rubble, wood-ashes, etc. About the end of March, but when the ground is in a convenient state for working, it should be well forked over, and the beds marked out four feet wide and two feet apart. Take out the alleys, and throw the soil up on to the beds, which, especially on heavy retentive soils, are best if raised above the normal level. Mark each corner of the beds with a neat but stout oak post.

The more quickly the roots of asparagus are transferred from one position to another, especially young plants, the better, as nothing is more harmful than to let the roots become dry through exposure, therefore have all in readiness, and for preference choose dull or showery weather for the work. Young plants of a good variety may be purchased for planting, but I prefer raising my own plants from seeds. If seeds are sown early in April in drills a foot apart, on a light rich soil, and the seedlings are subsequently thinned out to a foot apart, they will make excellent material for planting out the following spring. I much prefer this method to sowing the seeds on the permanent beds. Each bed will accommodate three rows, with the plants about fifteen inches apart. Spread the roots out evenly near the surface, covering them with fine soil (taken from the alleys) about three inches deep. Endeavour to promote a good growth through the summer months by copious waterings in dry weather, and by an occasional application of an approved fertiliser, and keep the beds free from weeds if possible. No other crop should be allowed to occupy the beds, but, of course, advantage may be taken of the alleys for early supplies of cauliflowers, lettuces, etc.

No succulent young growths should be taken from the bed until the second year from planting, however well the plants may seem to flourish. Support the outer growth if there is any fear of damage from wind. Cut down the stems when thoroughly ripened, with a pair of short shears, hand weed the beds, and cover with three inches of well-decayed farmyard manure. Then edge up the beds and level the alleys for appearance sake. The beds will thus remain until the spring, when they may be raked down and given a dressing of salt, which is very useful for asparagus. When in bearing the beds should be examined every morning and the growths removed with an asparagus knife.

A good dish of asparagus is a telling item in a collection of vegetables, especially if even specimens are selected and tied up in a bundle, with broad strands of raffia, and presented in a beautifully fresh and clean condition, with a garnishing of parsley.

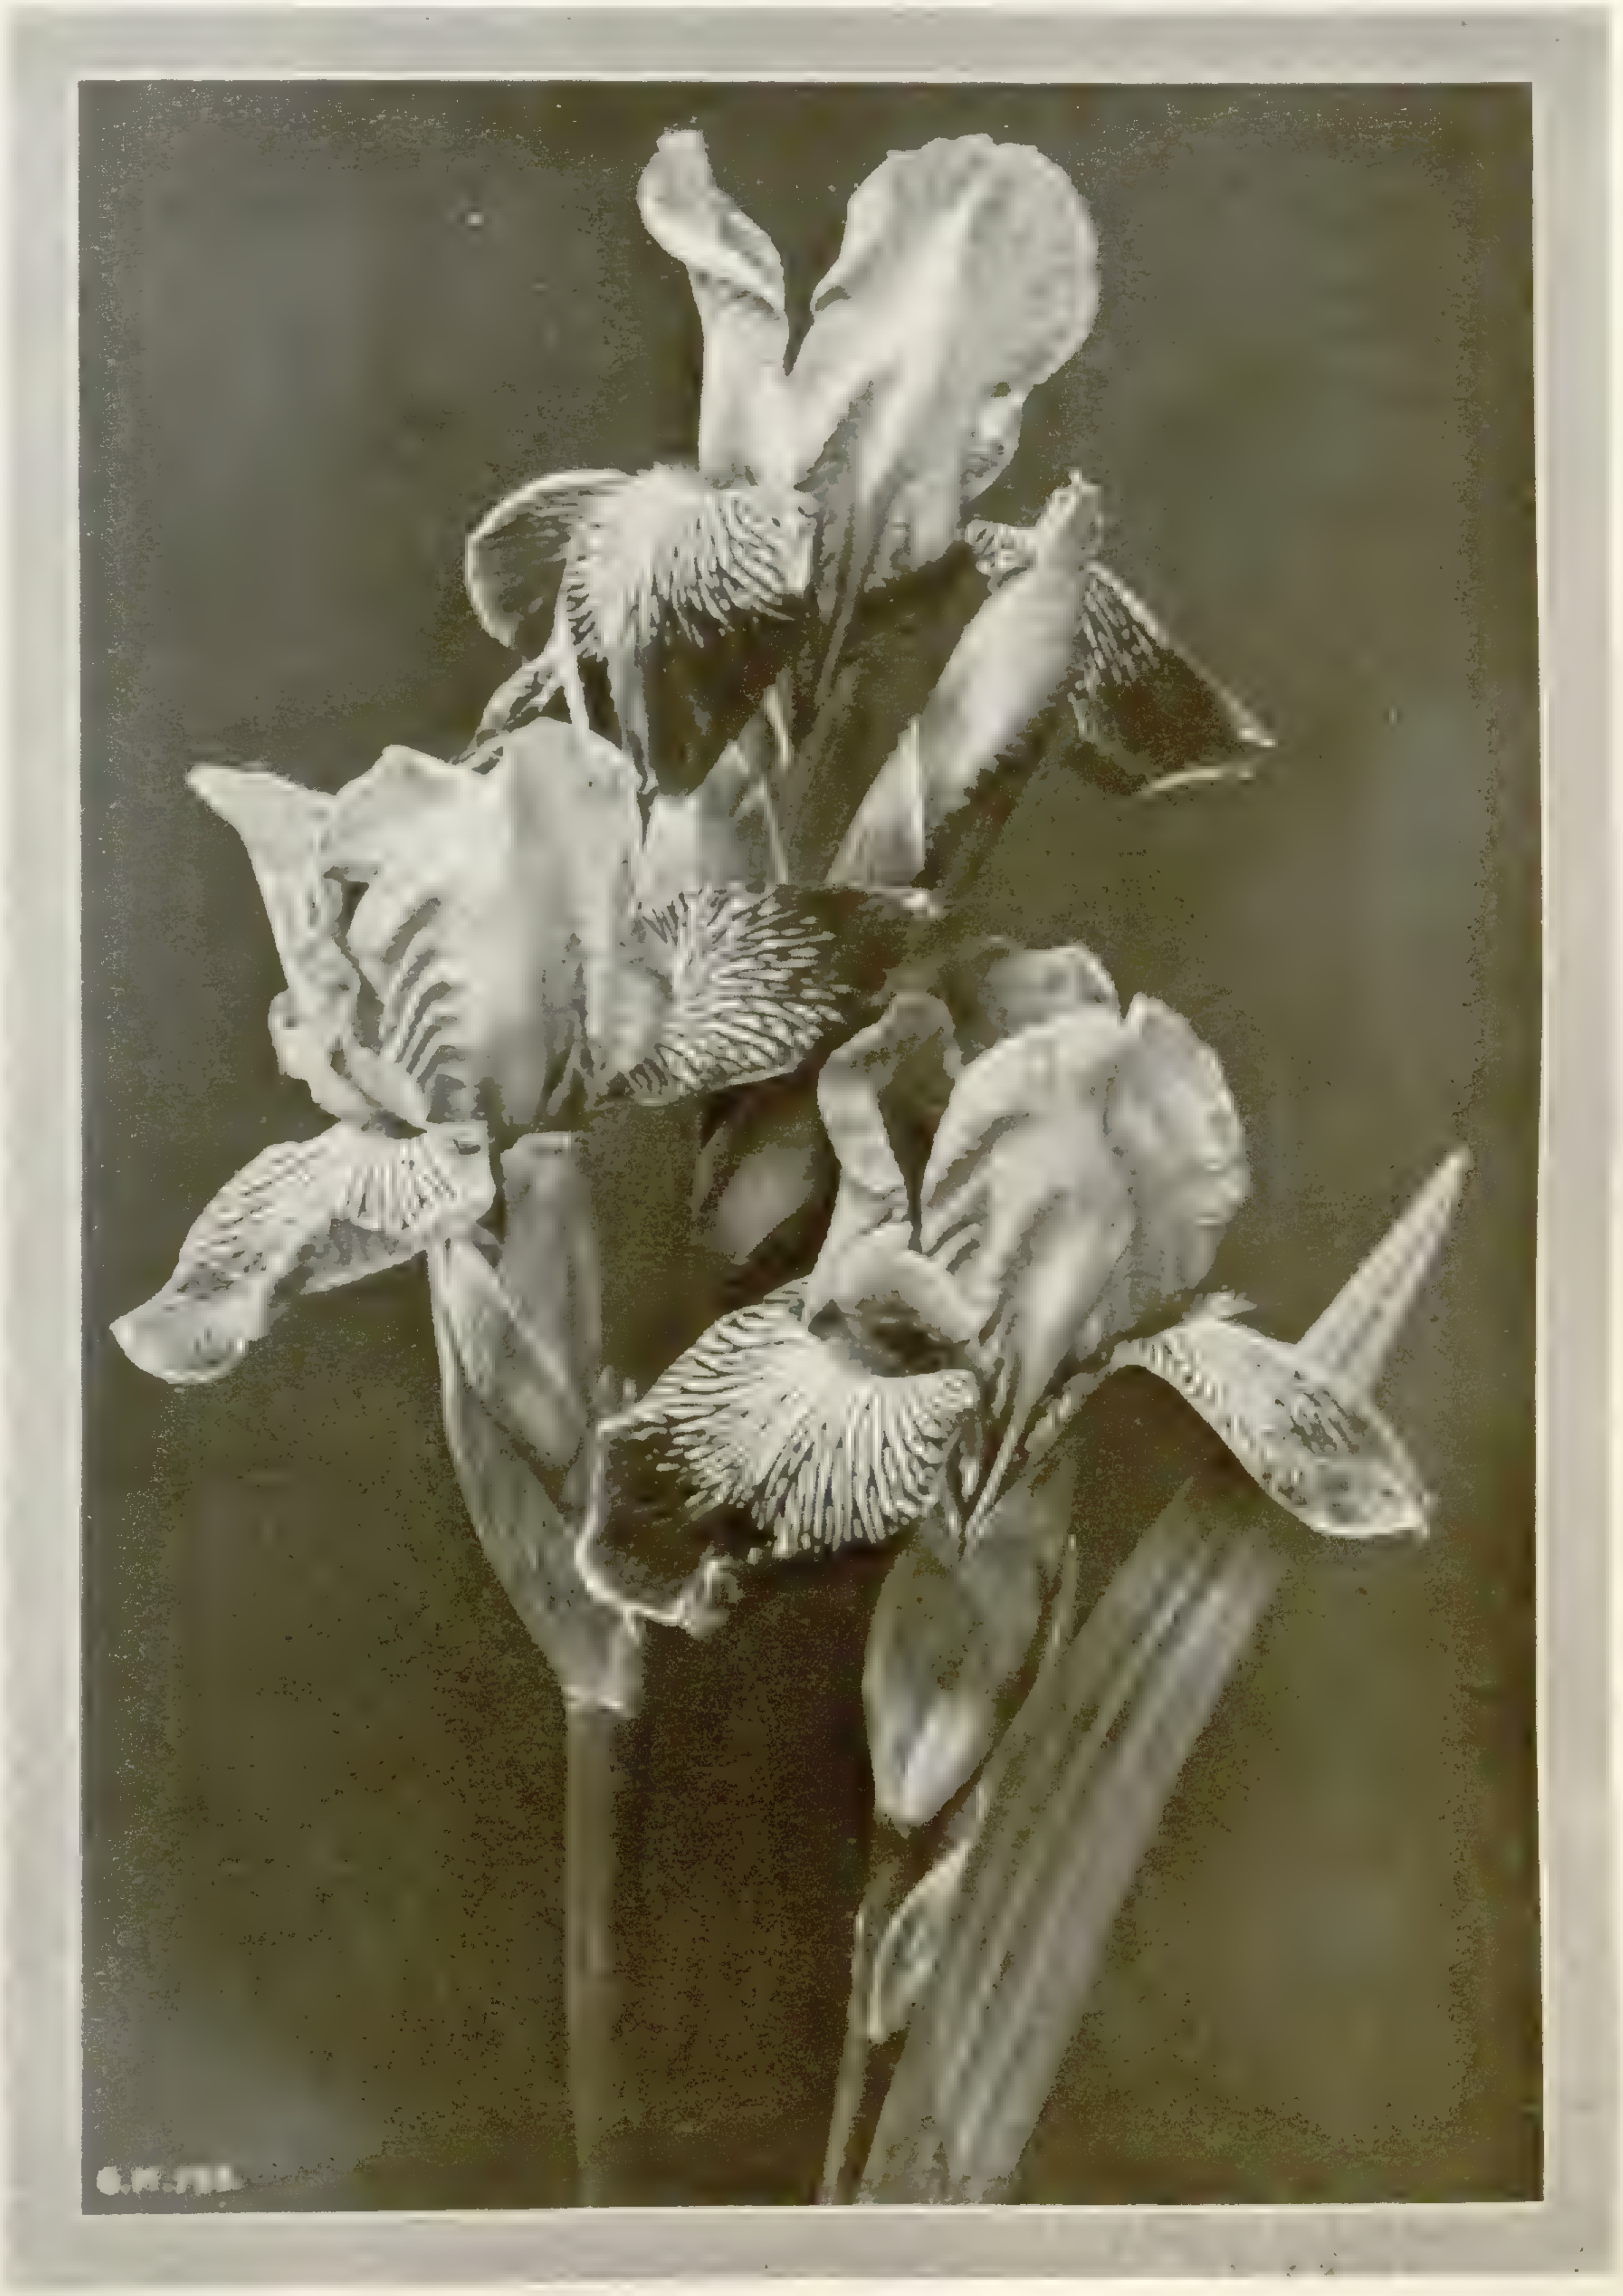
Many varieties are listed in catalogues, and these are no doubt of high merit, but if one variety only is recommended it must be Connover's Colossal, which is difficult to surpass.

E. BECKETT.

Aldenham House Gardens.

IRIS MAORI KING.

No garden is complete without groups of German irises, but in far too many instances insufficient attention is paid to the selection of varieties, and this is a matter for regret, when we remember the many splendid named varieties that are obtainable at small cost. One of the most brilliant of the varieties in which golden yellow colouring is conspicuous is named Maori King. The illustration serves to show its fine form and markings, but cannot convey the bright golden hue of the standards, and the rich deep crimson falls with their yellow base exquisitely veined with purple. It is a variety that ought to be included in the smallest selection of these useful and intensely hardy flowers.



IRIS GERMANICA MAORI KING.

Standards, golden-yellow; falls, crimson, with purple veins on a golden base.

AMONG THE ALPINE FLOWERS.

> "Gardens just now have more of promise than performance. The rose shows only her green leaf, the lily not even suggests the glory of her grace that is to come. But all sorts of bronze spear-heads and little lance-like points of green are piercing the earth, and with imagination's help, one may revel in visions now, in April's early days." HUBERT BLAND.

However true the above quotation may be of the ordinary garden it is certainly not an apt description of the alpine garden in even early April, although now, as this is written, when the month has not yet passed its half-way house, it is still less according to fact. There are many flowers in blow; flowers which not only give us foretastes of those which are yet to come, but in themselves give us feasts of beauty which will come back to us in the later months as among our many garden treasures of the memory. Are there not turquoise forget-me-nots, with their dainty little flowers set thickly together and lighting up one's eyes with their beauty and with the joy which appears to radiate from these gladdening little blooms? Are there not violets and violas, which give us sweet fragrance and lovely blossoms as they meet us in the garden? Have we not spiraeas just ready to open their buds and to delight us with the sight of their dainty white flowers on the twiggy branches of the shrubs?

Yes! there are these, and many more of choicest grace, and nowhere do they seem more visible than among the bulbous plants which await our welcoming glance.

Tulipa Kaufmanniana.

One wonders if there is anyone so lost to all sense of appreciation of floral beauty as to despise the lovely Tulipa Kaufmanniana. Its beauty is such as to almost make one envious of the doughty general whose name is enshrined in our memories by association with so lovely a flower. It is not one which absolutely requires the rock garden to show its charms properly, but it looks nowhere better than on a low flat spot on the rockery. There when it opens its dainty flowers flat to the sun, like some beautiful water lily, its beauty is unquestioned, and, surely, unquestionable. Variable as it is, there is hardly a poor form among the varieties which have come our way, and we annually look forward to its reappearance and to the opening of it-flowers. When in bud it is lovely, with its long, elegantly-formed segments, but when open it is if possible, more lovely still. As for its colouring, it is elusive when we attempt to describe it, especially as the flowers are not all alike. "A groundwork of cream, flushed or marked with carmine and yellow," is all one dare attempt to say, and this falls far short of the reality. Then this tulip is dwarf, growing with me little more than six inches in height.

One must, one supposes, now condescend to matter of fact notes regarding its requirements, and these appear to be a free soil, with a little sand about the bulbs, which are planted about October, and with the crowns about two inches deep. A moot question is that of occasional lifting and drying off. One does not care to practise this in the rock garden, as being rather a mar on the genius of the place, but one has learned that several of these Turkestan tulips are all the better for occasional lifting and drying off before replanting. Much depends upon the season, and a dry district where the soil is well drained, will happily obviate the necessity for annual lifting and replanting.

Primula marginata.

Many alpine growers are only too ready to fall victims to the fascination of the primula. It is little wonder that this is so, for the genus is a charming one, embracing in its sisterhood many flowers fit to be included in the most select list of the choicest alpine plants. But—what a pity one has to use the "but"—there are many of the members of the genus which call for more care and attention at our hands than they can well receive. There are some which, while hardy in the ordinary sense, generally require some protection from our winters' hardships, and fail to live for any length of time when exposed to their vicissitudes; and there are others which call for little attentions which may be likened to those readily paid by the lover to his mistress, but which are not expected of the man in the street.

There are some eminent growers of these primulas who do not hesitate to urge upon the cultivator the need of growing them under frames in winter, and of affording them some special marks of care. But this cannot be done by the ordinary grower of alpine flowers, who has, as a rule, too many pets to enable him to give the primulas special petting and coddling. To him there are many which may be looked upon as forbidden beauties, and he will do well to limit himself to some of the easiest to grow. Such is Primula marginata: not to be confounded with P. auricula marginata—a very beautiful little plant, whose greyish leaves are prettily margined with silver and which gives dainty little trusses of small purplish flowers. The taste of those who have had their appetites for size pampered by the great blooms and huge trusses of some of our modern primulas will not appreciate those of P. marginata, but those who love nature's primitive flowers will admire this beautiful little plant, which is, moreover, an easy one to cultivate. It thrives well perched up on the rockwork and is never happier than when it stands boldly out of the rocks on an elevated part of the garden and in full sun for the most of the day. Like others of its class, it should be occasionally lifted and replanted a little deeper, if its position will not lend itself to top-dressing. It is a pretty little flower, of which there are several varieties not always easy to procure, such as Dr. Douglas's one, grandiflora, and cærulea. It is not particular as to soil.

Other Flowers.

One has possibly spoken with undue length of these two flowers of the time, but there are many others which would call for a note in their praise. The earliest of the chionodoxas have come and gone, but the later ones and those planted in shadier places are still bright as of old. The more one knows of these flowers the more does one bless the day of their introduction. They seem to reck not either sun or shade, but flourish and bloom cheerily away. In their varying notes of blue, lilac, and lavender, with excursions into white and rose, they are lovely things. Then there are muscaris, with their crowded heads of blue and deep black-blue, white, flesh, or pearly-blue. They are good rock garden plants indeed. Then there are daffodils, many of which, especially the dwarfer ones, such as Narcissus cyclamineus, are among the daintiest things for the rock garden in early April.

Aubrietias begin to gladden us with their sheets of colour. Their value is so great as to be unappraisable, and we cannot dispense with their masses of bright flowers. Even the arabis, or rock cress, despised as it is by many, because it is a "common" thing, has not a rival of its kind, even though we covet the looked-for white aubrietias to take its place. We cannot afford to neglect its use on the rougher parts of the garden at least. Then there are choice saxifrages now; with little cyclamens; anemones of several kinds, such as choice varieties of nemorosa, ranunculoides pallida, intermedia, blanda, apennina, and others of the race in plenty now. But the sheets of paper call for a halt, just when we see other flowers appealing for a reminder from the pen.

S. Arnott.

BOLD PLANTING.

The great opportunity of the year comes in May and June, the former month chiefly, when the garden can be transformed for the floral season by the creation of grand groups of colour. Only by bold planting can the finest effects be gained; the same plants that would look tame if dotted about beds and borders will arrest attention and capture memory if clustered together just where needed, or in situations that show them off to perfection.

The angle of housewall, between bay window and porch, is one position that should be given up to a pronounced colour scheme; if the building is of red brick the general idea would be to use white flowers near, but if a salmon-pink mass can be arranged the display will prove equally harmonious, and far more original. It may be said that salmon flowers for summer planting are not numerous, but we can have ivy-leaved pelargoniums trained high up a trellis of bamboo canes against the wall, and other plants of the same kind growing in wall pockets just above. Salmon verbenas also will trail down to mingle with those below. There are tall asters to mingle with double and single pelargoniums, also the annual Clarkia Double Salmon Queen, and the salmon dianthus. Phlox Drummondi is most successful in this shade for covering the soil. If a yard or two of ground, of good quality, is given up to the above plants, there should be no lack of the desired hue during many months.

Against a white or grey house orange is the most advantageous colour, possessing the warmth of red without its crudeness, and being easy to obtain in concentrated form. A background of climbing tropæoleums should not be despised, and against this tall African marigolds can rise, zinnias of the right hue grow nearly as high; begonias, gazanias, and Tagetes signata pumila will give the needed carpet. Cream walls, such as those of roughcast buildings, are an admirable background for vivid violet; wire netting, painted the same cream, should be nailed across to support Cobæa scandens, then heliotrope of dark hues, ten-week stocks, and tall and dwarf asters, with violas, will suffice below.

Shrubbery foregrounds are too often neglected when the width of ground is deemed insufficient for large plants, but we should realise that often the greatest brilliance is yielded by stretches of small-growing plants. If the near shrubs are silver foliaged or variegated green and yellow, then ultramarine blue cannot be excelled for contrast, and, fortunately, we have hardy plants that give blossoms of this tone in extraordinary profusion, notably, dwarf cornflowers, Phacelia campanularia, and lobelia; all these show little leafage when well cultivated, and in full summer bearing.

It is well to observe in gardens that we visit which are the masses and combinations that can be seen best from a distance; one fine display I recall was made by Madonna lilies against a hedge of glossy laurel, and, though it is too late for lilium planting, much the same tall graceful florescence will be yielded by nicotianas; the white can be repeated as a lower level foreground in many ways, but ten-week stocks and double white petunias, carpeted by a viola, can be recommended as giving the most snowy bloom.

Banks, being raised above the ground level, give a special opportunity for bold planting; a large sunny bankside, visible across lawns and parkland can be given three big groups of Chilian beet, and a further covering of rose-pink which dwarf asters between Silene pendula compacta gives untiringly until late autumn. If the soil of a bank is very poor and dry it affords a chance for gaining a vermilion blaze by the close planting of a Tom Thumb tropæolum, while single scarlet pelargoniums also will produce more blossom than leaf. Nicotiana Sanderæ, though varying in shade, has a colour note all its own, only shared by some varieties of [illegible] and zinnia; upon turf the rose hue looks brighter, so also it does against bright green shrubs, while I once saw quite a remarkable contrast afforded it by the emerald green tiffany blinds stretched along the side windows of a conservatory. To carpet these tobacco plants with white flowers is rather a mistake, for there is a rose Tom Thumb nasturtium that matches them admirably.

Ultramarine blue and lemon-yellow in a large bed will be seen farther away than scarlet and gold, because the contrast is more startling. Wherever delphiniums are largely massed yellow violas should be the wide edging belt, but if a row of golden calceolarias can be introduced behind the the result will be improved. A tall yellow flower, such as the sunflower, may be banked up, as it were, by tall blue cornflowers, Phacelia campanularia, and lobelia.

Magenta has great value near a grey stone house, terrace, fountain, or where urns and statuary are much used. Beds of the carmine petunia are fine, but even brighter are the stocks and asters of that shade.

M. H.

Lawns.—Those who desire to make a new [illegible] bowling green, or to renovate and maintain [illegible] ones in good condition, can have no better [illegible] "Lawns and Greens," by T. W. Sanders, [illegible] net, by post 1s. 2d.; bound in cloth 1s. 6d., by post 1s. 9d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

NEW BOOKS.

THE CULTURE OF VEGETABLES AND FLOWERS.

By Messrs. Sutton and Sons. (Simpkin, Marshall, Hamilton, Kent, and Co., Lim., London.) Price, 5s. net.

Although this highly popular work is limited to such ornamental plants and useful crops as can be raised from seeds and roots, it forms a portly volume that is remarkable for its comprehensiveness. It is of value for its usefulness, and of much interest as evidence of the large number of ornamental plants that can now be raised in quantities from seed, as compared with what could be accomplished in that way some forty or fifty years ago. At the present time a very considerable number of perennials that in bygone days were raised from cuttings, can now, as the result of the splendid work that has been accomplished by careful selection, be raised from seed without any material deviation from the types. The verbena may be mentioned as a noteworthy example, and those only who have had experience in the propagation of these plants by means of cuttings, and raising stocks from seed, can fully appreciate the latter, or more modern, method. The saving of space at certain seasons of the year, and of time also, is very considerable, and what is true of verbenas is true also of gloxinias, and a number of other subjects. In view of the importance of the many plants required for beautifying the flower garden, and the conservatory and greenhouse, that can be readily raised from seed, it has become a necessity that cultivators should be fully acquainted with the best methods of raising stocks of the several kinds.

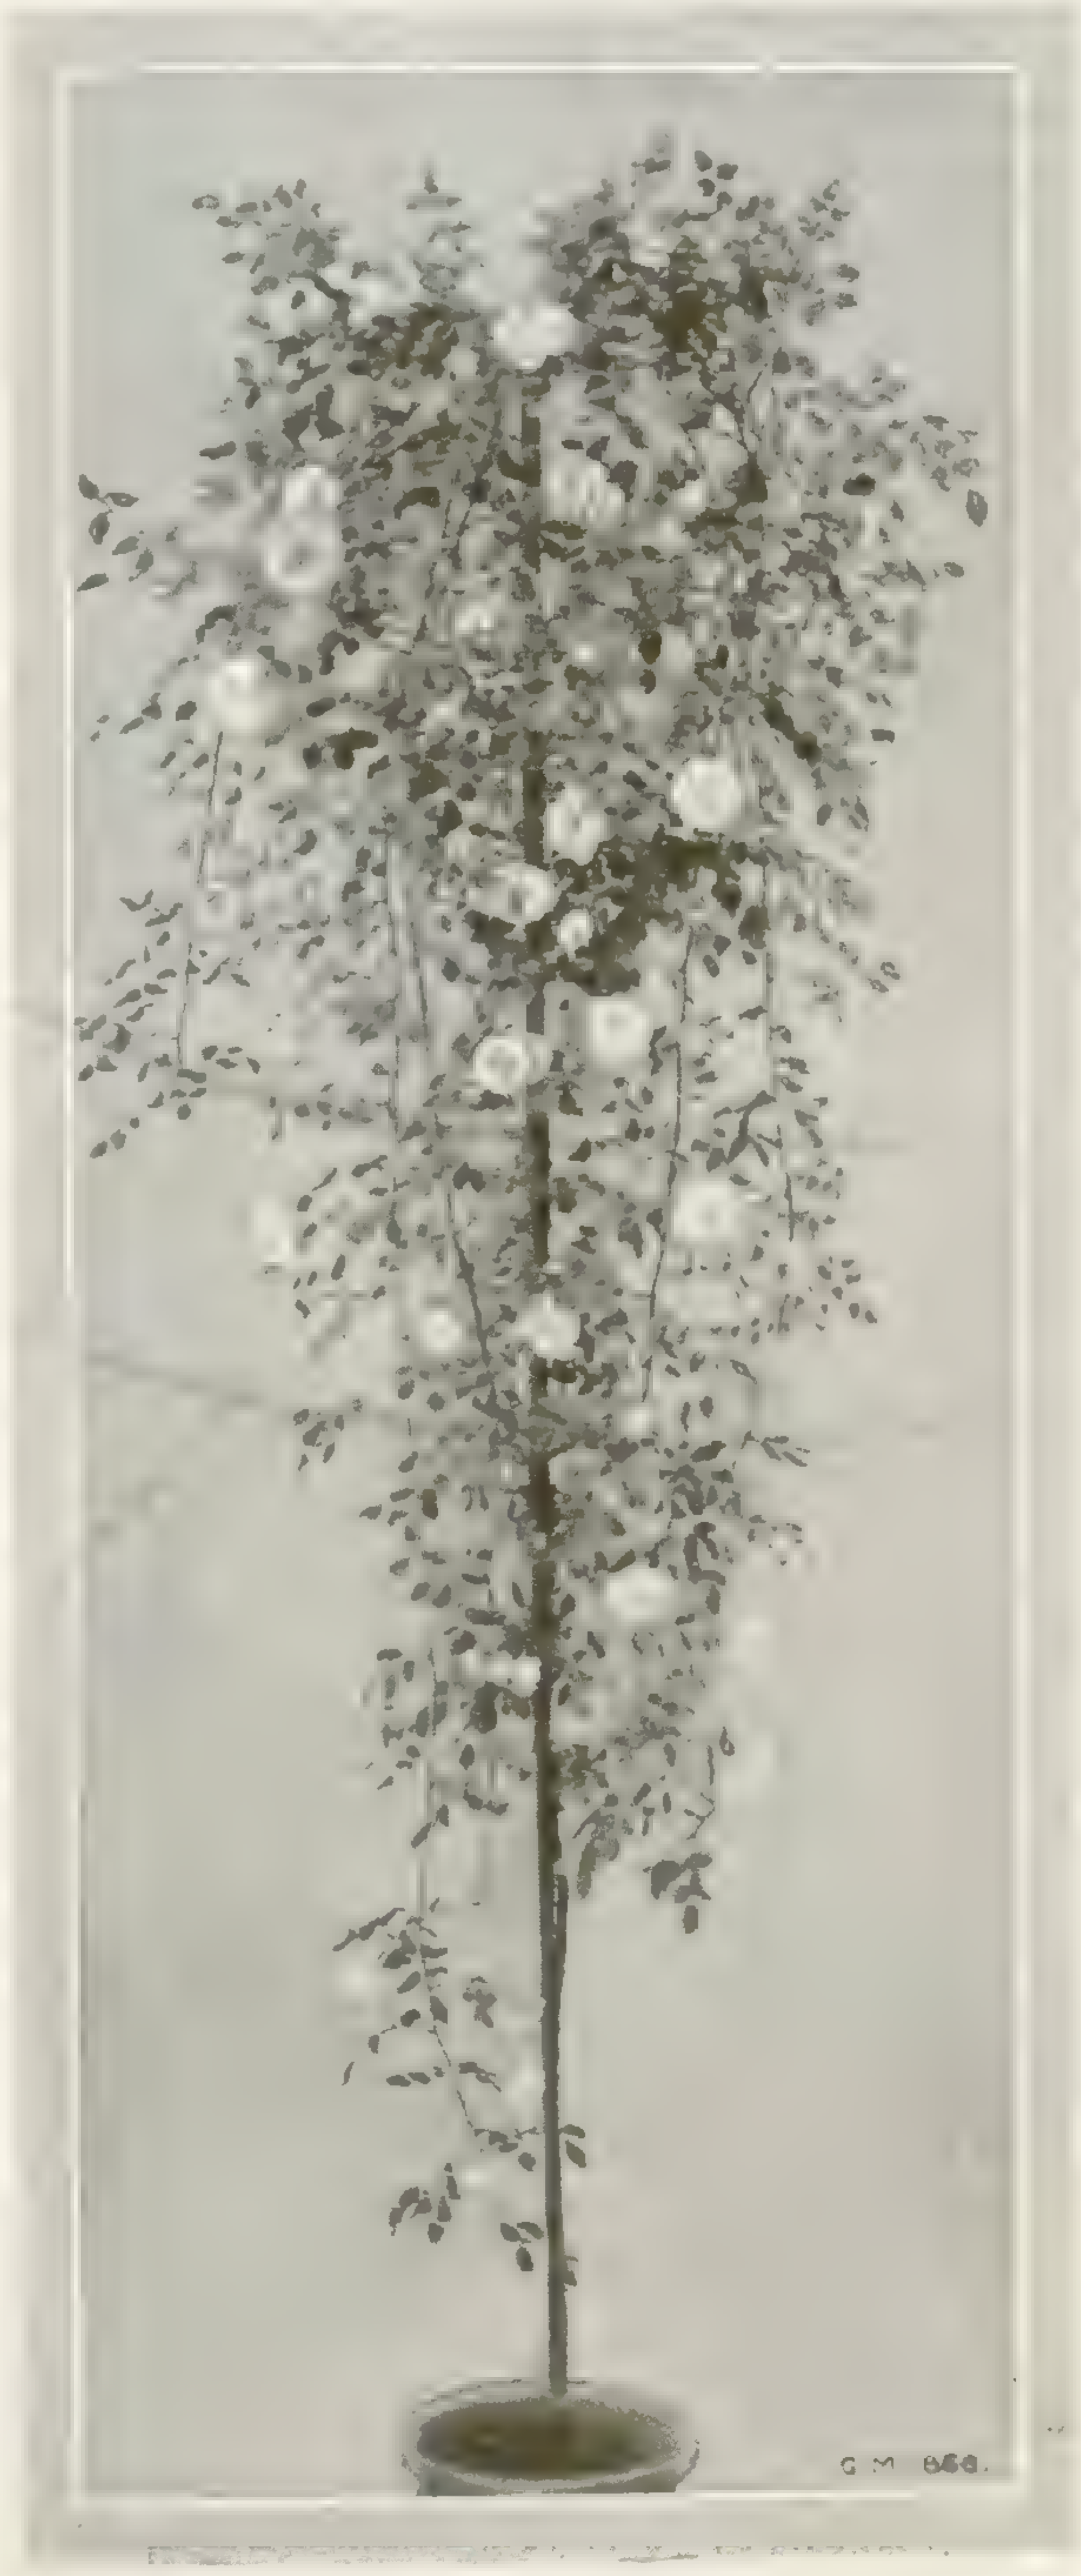
These are described in the work before us with remarkable clearness, and with sufficient fulness to enable even the tyro to understand the course of procedure that should in each case be followed. The work is not less remarkable for the information it contains relating to the cultivation of vegetables, than of ornamental plants, and possibly some readers may regard it as of the greatest value as a guide to the kitchen garden. We are not disposed to institute such comparison, but rather to regard each section of equal value as guides to good cultivation. Each useful crop is dealt with at some length, and there is a carefully prepared calendar of work in the kitchen garden, and an admirably written chapter on the chemistry of garden crops. There is also a calendar of work in the flower garden, and chapters on lawns and pests of garden plants, which add much to the usefulness of the work, which, we would add, has reached its fourteenth edition.

TOMATOES.

By R. F. Castle. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.). Price, 1s. net.

Tomatoes have acquired such an important position in both private and market gardens that it is a matter of much importance their cultural requirements should be thoroughly understood by all who are engaged in gardening. This book, which has been edited by Mr. T. W. Sanders, deals with both indoor and outdoor culture, and the cultural requirements of the plants are so fully and clearly explained that with its aid there should be no difficulty in obtaining heavy crops of fruit of high quality.

In the section devoted to tomato culture under glass the most suitable houses and the best methods of construction receive attention, and we are glad to find the author advising the fitting of houses with heating apparatus that are sufficiently powerful to maintain the requisite temperature without having to drive the fires when the outside temperature is comparatively low, as that involves much anxiety and considerable waste. The various methods of propagation occupy the second chapter, and in addition to explicit instructions for carrying out the details the relative merits of the several methods are made quite clear. In the succeeding chapters in the first section the treatment of seedlings, composts, permanent quarters, general management, manures, removal of foliage, exhibition fruits, winter tomatoes, culture in frames, and varieties for indoor culture are fully described. The section devoted to the production of crops of tomatoes in the open will appeal to a large number of owners of gardens, and it should afford gratification to many who have no glass houses at their command to find that the production of outdoor crops is a really simple matter, provided the cultural details are carried out in a proper manner, and at the right time. In other words, provided the advice here given is followed. There are chapters on the pests and diseases that attack the tomato plant and its fruit, from the pen of the Editor, who also contributes some interesting historical notes.



ROSE LEONTINE GERVAIS.

A distinct and beautiful Wichuraiana variety, grown by Messrs. Paul and Son. Flowers, bright red, salmon, and yellow.

THE SCHOOL GARDEN.

By J. E. Hennesey. (Blackie and Son, Lim., 50, Old Bailey, E.C.). Price, 1s.

An admirably arranged book, in which the making and management of school gardens are dealt with in a manner at once clear and concise. The author, who is evidently equally well acquainted with teaching in schools and gardening operations, has succeeded in producing a book that will be of much value to teachers who are preparing themselves for taking classes in gardening, as well as to scholars who are attending day or evening classes in gardening. The book has the additional advantage of being strongly bound.

THE ROYAL ORDERING OF GARDENS.

By Major R. Rankin. (Thomas Nelson and Son, Edinburgh.)

An instructive and pleasantly written essay on the planting of gardens with a view to the production of natural effects, and rendering them more or less attractive throughout the year. A comprehensive list of trees, shrubs, and flowering plants has been prepared for the guidance of the reader, and to afford him the fullest possible assistance they have been arranged according to their colours and the seasons in which they are the most attractive. The book contains a plan of a garden planted in accordance with the author's views.

ROSE LEONTINE GERVAIS.

Although this beautiful rose has not obtained attention so quickly as have some other of the Wichuraiana varieties, it possesses much merit, and is especially deserving of consideration in gardens where weeping standards obtain favour, whether for flowering under glass or growing in the open. It is not according to the observations that we have been able to make so free in blooming as Lady Gay and other popular varieties belonging to the Wichuraiana section, and consequently does not produce such effective displays of colour. But it is free enough in blooming to enable it to contribute appreciably to the attractions of the conservatory and flower garden, and its elegant habit is such as to justify it having a full share of attention. Habit should count for much in the selection of varieties for weeping standards, especially those to be grown in pots for beautifying glass structures, and, as will be seen from the accompanying illustration, the variety is especially favoured in this respect. This specimen was probably not more than a year old when the photograph was taken, yet it had slender growths many feet in length, and all depending in the most graceful manner imaginable. The height was between eight and nine feet, and in glancing at the illustration, it is not difficult to see that in a comparatively short period specimens of considerable size and of much elegance may be obtained. The flowers are produced in clusters ranging from three to ten in each, and these are attractively coloured bright red, salmon, and rich yellow, the colouring being quite distinct from that of other varieties belonging to the same group. We would add that the specimen illustrated was grown by Messrs. Paul and Son, Cheshunt.

Daffodils at Eaton Hall.—The display of daffodils in the gardens of Eaton Hall, Chester, is, as usual, remarkable for its magnitude and beauty, and to enable his neighbours to enjoy the feast of flowers, the Duke of Westminster generously opened the gardens to the public on Wednesday and Thursday last. The large number of visitors testified in no uncertain manner to the public appreciation of his kindness.

"Journal" of the Board of Agriculture. The issue of this publication for the current month is of quite exceptional interest. Chief among the matters especially deserving the attention of horticulturists are the "Notes on the Time of Blossoming of Fruit Trees" by Mr. Cecil Hooper; "The Sclerotina Disease of the Gooseberry or Die-Back," by Mr. E. S. Salmon; and "Overhead Electrical Discharges and Plant Growth." by J. H. Priestley.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CYPRIPEDIUMS.—Many of the late winter and early spring flowering cypripediums will now need repotting. In many respects these require similar conditions of culture to that usually afforded the winter-flowering section, but, being later in blooming, the growth is naturally more backward, and they are thus some weeks later in completing their growth in the fall of the year. To keep these plants in the most vigorous condition I find it desirable to prevent an accumulation of back growths. Where the plants are in a robust state the last flowered growth is ample to sustain the coming season's new growth. There is no advantage derived from retaining the growths behind, but by severing the rhizome between the back growths the latter are induced to produce breaks that may be used either to increase the size of the specimen or provide new stock.

C. ROTHSCHILDIANUM, C. STONEI, and others of this section which are now coming into flower must have every encouragement that humidity and warmth can give them until their flowers are expanded. Plants that will need repotting should be examined, and have their rhizomes severed, so that new growths may be produced from the base of back growths by the time that the plants pass out of flower and are ready for repotting. These differ very materially from other cypripediums from the fact that they take from two to three years to develop a flowering growth, and it is absolutely essential that they should have one or more growths in front of those flowering if we are to obtain flowers each year. This fact is often overlooked, and the species are thus often credited with being shy flowering. It is only after the plants of C. Rothschildianum have grown into good specimens that we secure a satisfactory annual crop of flowers.

THE HYBRIDS, such as C. Youngianum, C. Morganiæ, C. Youngiano-superbum, and C. W. R. Lee forms, are all worthy of consideration for exhibition purposes during the summer months. They should be afforded as much light as may safely be given without damage to foliage at the present season. A position well up to the glass suits them at all seasons, as it is only when grown under excessive shade that soft growths are produced, which are often too succulent to properly mature and so start into new growth at the expense of flowering.

ALL CYPRIPEDIUMS should be carefully examined for eggs of black thrips, which may have been deposited on the leaves at the end of last season, and where found these must be carefully sponged off; a little soft soap in the water will assist their removal. It is desirable that fumigation or vaporising should be done about once a month, and spraying with some safe insecticide at intervals of a fortnight, and where this work is done systematically throughout the whole year very little difficulty is found in keeping insect pests in check.—H. J. Chapman, Oakwood Gardens.

FRUITS UNDER GLASS.

EARLY PEACHES.—As soon as the fruits pass the "stoning" stage, which can be ascertained by their free swelling, the night temperature may be raised to 65 deg., but this degree cannot be exceeded without in some way sacrificing the size of the fruit. The warmth by day should be correspondingly higher. Carefully ventilate the house, and in favourable weather entrap the sun's warmth by closing early in the afternoon, at which time the trees should be forcibly syringed, by which means they can be kept clear of red spider. Thoughtful attention should be given to supplying the trees with water and manures, and in doing this the formation of the borders and general conditions of the trees should be considered. Healthy established trees carrying full crops of fruit and having their roots confined to small borders require in this respect frequent attention, while, as is obvious, in some other cases different treatment must be followed, or stone-splitting and other difficulties may arise. By raising the fruits upon pieces of smooth lath to the surface and keeping them clear of leaves colour will be the more highly developed.

EARLY MUSCAT VINES.—Vines carrying healthy leaves, and sufficiently advanced to have fruit freely swelling, will be making active root growth, and should have liberal supplies of water, and suitable ready-acting manures. Especially will these be needful in the case of old vines that have not for some years had their borders renovated. Keep the sublaterals regularly stopped, and other ordinary details of management closely attended to. As the sun's power increases it may be desirable, at any rate in cases of badly constructed houses (in order to prevent the scalding of leaves), to minimise its power by clouding the glass with a thin coating of lime water.

MUSCAT GRAPES.—Vines in Muscat houses will soon be in blossom, and should, before they reach that stage, receive necessary attention in the way of supplies of root moisture, stopping of laterals, and relieving each of its duplicate bunches, and thus avoid the necessity of attention to these matters during the flowering season. Being uncertain setters these grapes require special treatment while in blossom, and should at that time be given a warm, tolerably dry, and buoyant atmosphere, regulated by careful ventilation and attention to the heating apparatus. A night temperature of 65 to 70 degs., from 5 to 10 deg. higher on dull days, and an increase of about 10 deg. from sun heat, will be suitable. To assist the fertilisation of the flowers, distribute the pollen by gently shaking the vines several times daily, and at midday, by carefully drawing a rabbit's tail over the bunches; and, moreover, to enhance the prospect of success, should Black Hamburgh or other free-setting varieties be in blossom, carry some of their pollen upon a sheet of paper into the Muscat house and apply it to the Muscat flowers by means of a rabbit's tail. There should be no final thinning of bunches and no thinning of berries until it can be clearly seen which are the most perfect bunches, and when this is done the weight of the crop should be decided from the state of the vines and the means at command of nourishing them. After the thinning is completed the borders should be examined, and thoroughly moistened with tepid diluted liquid manure if necessary, or be top-dressed with a suitable artificial manure, and subsequently watered with tepid water. Should red spider appear carefully sponge the leaves with warm soapy water; the best way of dealing with mealy bug while vines are in growth is to apply spirits of wine by the aid of a strong feather or small brush. —T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

LEEKS.—Seedlings from the first sowings will soon be ready for planting in well-prepared trenches; place them in single lines. The trench should be prepared as for celery, filling in to within four inches of the surface. To the soil chopped from the side of the trench add old potting soil, soot, and burnt garden refuse in plenty; rake and level down, tread firmly, then plant at fifteen inches apart, well water in, and in dry weather syringe daily. Within a week to ten days afterwards blanching should be proceeded with, using for this purpose ordinary brown paper rolled up to form a tube an inch in diameter, and five inches in depth; gradually draw the bands up as the leeks grow, filling in below with ordinary finely sifted soil, until the desired length of blanched stem is attained, when the collars must be drawn off altogether, and light strawy manure placed around each leek at this juncture to prevent heavy rains splashing the soil into the axils of the leaves. Leeks delight in copious supplies of weak liquid manure, and an occasional application of artificial manure. Prick off the later batches into boxes, and any remaining plants of the old crop should be dug up and laid in thickly under a wall or hedge facing north, where they will remain in good condition for some weeks.

SALSIFY AND SCORZONERA.—These two most useful vegetables are not grown half as freely as they deserve, and yet they are very much appreciated when served. Sown at the present time on ground which was manured for the previous crop, good roots will be the result. Give the surface a good dressing of burnt garden refuse, well harrowing it in, and draw drills eighteen inches apart, and an inch deep, sow thinly, and eventually thin the plants to six inches apart. Soot sown broadcast is very beneficial to this crop.

CARDOONS.—Sow at the present time in trenches prepared as for celery, filling them in to within six inches of the surrounding level. Give the surface a good dressing of old cucumber bed material, adding lime or broken lime rubble to it. Sow groups of two or three seeds eighteen inches apart, thinning the seedlings to the best plant in each group. Apply water regularly, and when blanching commences use strong brown paper collars nine inches deep, covering these with old strips of sacking, or even haybands, to the same depth; continue this process to a height of two feet.

VEGETABLE MARROWS. — Sow for the main crop in small pots, one seed in each pot; place them in a warm pit or intermediate house until germination takes place, and then gradually harden off the plants in cold frames ready for planting out. Attend to those that are growing and fruiting under glass, keeping them well supplied with water, and regularly syringed. Fertilise the fruiting flowers, and stop the leading growths.

CUCUMBERS.—It is now an excellent time to sow good frame or pit varieties in heat, as many lights will be vacant by the time the plants are ready for planting out. Attend to those fruiting in the cucumber house, by regularly stopping and feeding them, and thinning the leaves, growths, and fruit.

MAKE SOWINGS of chicory, borage, chervil, marjoram, purslane, plenty of spinach, and turnips.—Geo. Ellwood, Swanmore Park Gardens.

BUSH PEACH TREES UNDER GLASS.

There are various ways of training peach and nectarine trees in glass structures. I have had to deal with them in several forms, and the most satisfactory in every way was the following method of growing them.

The houses were high, lean-to, but slightly ridged at the top from the lower to the higher edge of the ventilators. This arrangement caused the sash bars in front to be placed at a sharp angle, and this permitted of the planting of a row of bush-shaped trees in front, with fan-trained ones on the back wall, although the houses did not exceed a width of twelve feet.

By paying close attention to the disbudding of the trees in the spring, the latter were not allowed to become too large for the space available, and I secured more fruits from the front portion of the structure than in other cases where the trees were fan-trained on wires. Moreover, the trees on the back wall received more light and air, as the base of each was well exposed, because the bushes were grown nine feet apart in front of them. All cultivators will not agree with the bush system of growing peaches under glass, but in my own case I found it to answer the purpose well.

G. B.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

On Tuesday, April 19, there was a splendid exhibition at the Royal Horticultural Hall, and the place was again packed with exhibits and Fellows and their friends. The amaryllis and the auriculas were fine features, and daffodils were delightful.

FLORAL COMMITTEE.

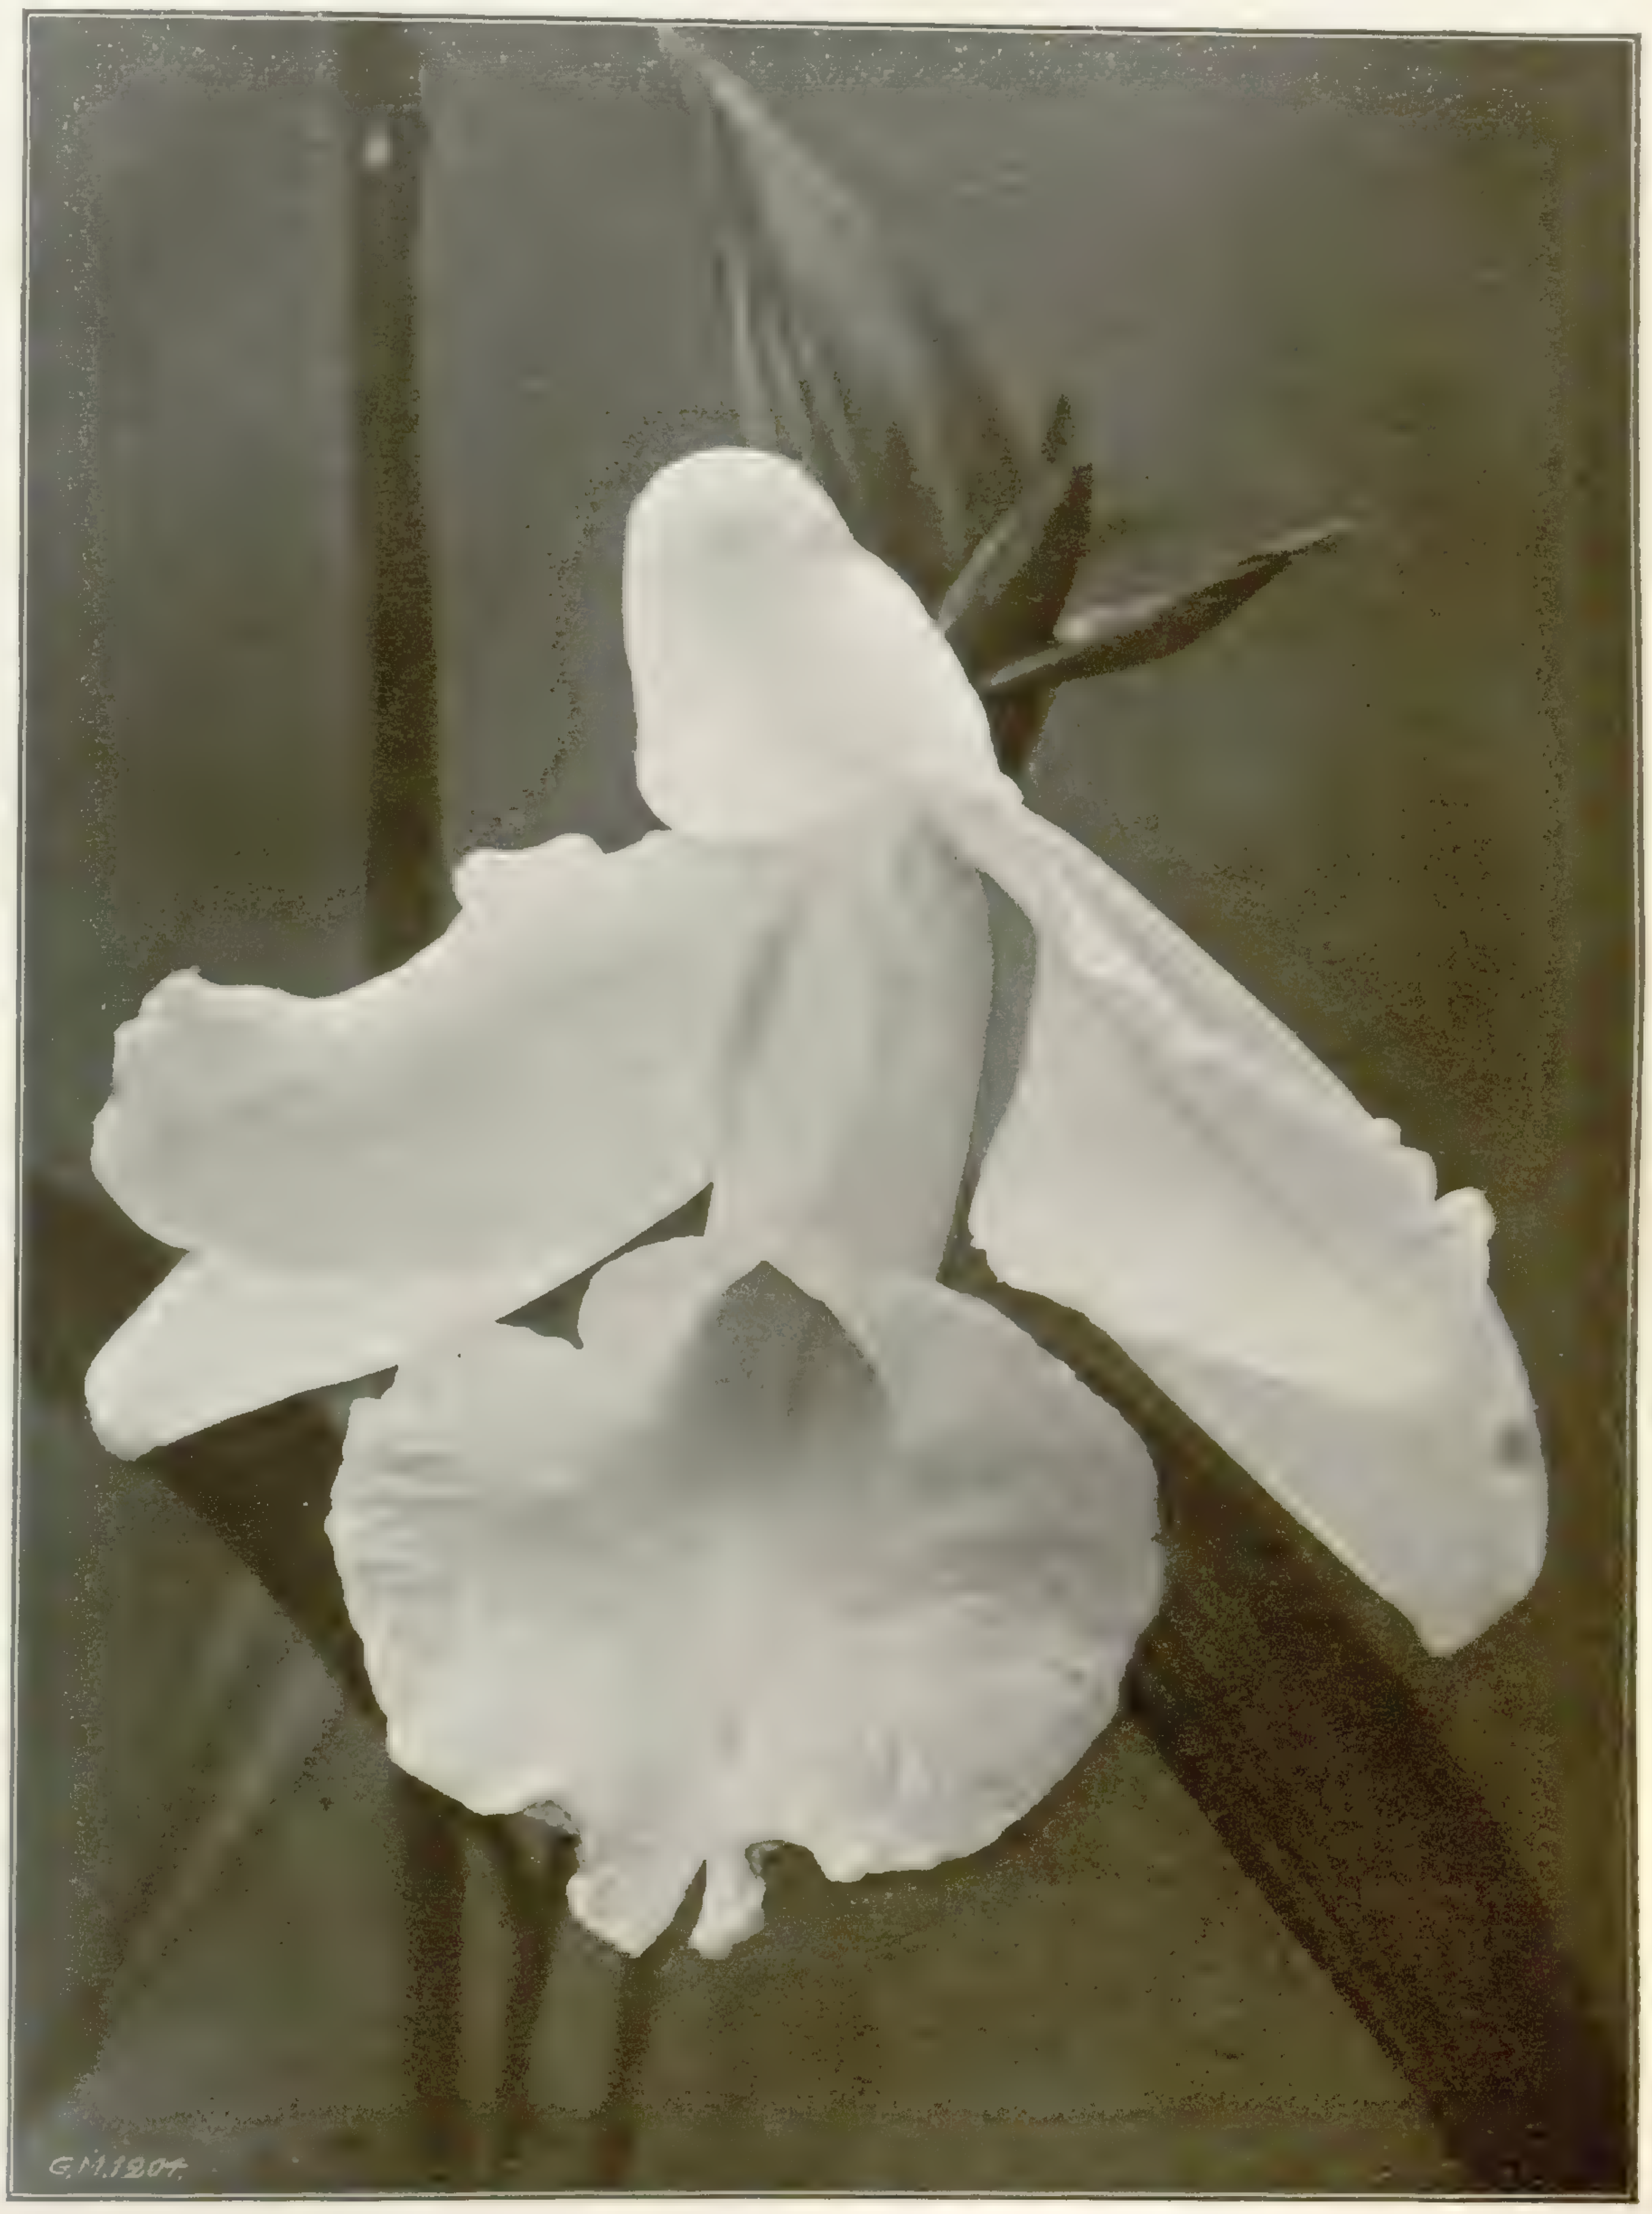
Conspicuously good was the display of amaryllis, finely staged at the top end of the hall by Mr. Chapman, gardener to Lieut.-Colonel G. Holford, Westonbirt, Tetbury, Gloucester. Mr. Chapman has for many years persistently worked at the improvement of these gorgeous flowers, and he has produced fine form and size, a wonderful refinement in the flowers, and has greatly added to the colour range by producing lovely shades of pink and deep rose. The exhibit was in every way a magnificent one—culture, form, colour were all represented in a very high degree, and many were the congratulations received by the gallant Colonel and his able gardener. Beside the scarlet, orange, and crimson varieties, there were a few of superior excellence, such as Calypso (A.M.), red shaded on a white ground; Rose du Barri, deep old rose, lovely colour; Cassandra, deep pink with white base; Lucretia, deep red; Gereant (A.M.), clear deep orange-scarlet, perfect form; Menander, rosy red; Cardinal Wolsey, intense and rich rose-red; Avalanche, pure white; and Comus, deep rose-pink.

A magnificent lot of auriculas—magnificent is the only word that will serve, even for these lowly flowers—was staged by Mr. James Douglas, Great Bookham, Surrey, this florist filling a long table with delightfully-grown and beautifully-flowered examples of show and alpine varieties, backed by a row of splendid polyanthuses. A few of the finer sorts were: Warley (A.M.), a new mauve-pink variety; Roxburgh (A.M.), a splendid large purple and maroon flower; Victor (A.M.), intense maroon-crimson, very effective; and such lovely alpine varieties as Chieftain, Janet, Goldfinch, Mrs. Markham, Ziska, Bluebelle, and Coral Strand.

The cactus-flowered cinerarias brought up by Messrs. Sutton and Sons, Reading, were charmingly elegant, and represented by a wide range of colouring, and great taste was displayed in their arrangement. The scarlet-flowered Matador figured in the centre of the group. A colony of the dwarf Primula viscosa var. Mrs. J. H. Wilson, arranged by Messrs. R. Wallace and Co., Colchester, was the attractive feature of their rock garden. The deep mauve-purple flowers freely borne by the dwarf plants, were greatly admired. Messrs. Felton and Son, Hanover Square, displayed a delightfully harmonious colour scheme by associating gerberas of many shades of colour with Madame Abel Chatenay and Lyon roses—the ladies could hardly get away from the exhibit. Roses were finely shown by several firms; Messrs. B. Cant and Sons, Colchester, had the large semi-double Rose du Barri in good form; Messrs. Wm. Paul and Son, Waltham Cross, displayed the "blue" Veilchenblau rose, and the semi-double rambling variety named Bordeaux, of somewhat similar colour; Mr. G. Prince, Oxford, showed grand flowers of the popular Frau Karl Druschki; Messrs. G. Mount and Sons, Canterbury, set up fine flowers of popular market varieties, and Messrs. Frank Cant and Co., Colchester, exhibited their lovely yellowish Lady Roberts in excellent condition.

Perpetual carnations were again very much to the fore, staged by Mr. H. Burnett, Guernsey; and Mr. W. H. Page, Hampton, and it is doubtful whether finer flowers of Rose Pink Enchantress have ever been staged than those set up by Mr. Page. The finest exhibit of forced shrubs was from Messrs. R. and G. Cuthbert, Southgate, whose mollis azaleas were again fine, and served to show up the specimens of Magnolia Soulangeana nigra.

Messrs. Storrie and Storrie, of Dundee, delighted everyone with their beautiful border auriculas and the range of colour in their giant free-flowering polyanthuses; the latter were grand, especially the deep yellow shades. Pelargonium Clorinda is becoming fashionable, and on this occasion good standards of it were exhibited by Mr. Scott, gardener to Mrs. Bischoffsheim, Stanmore, but they were not yet fully in bloom. Saxifragas of the decipiens group were well shown by Messrs. Bakers, Wolverhampton, the varieties Red Admiral and Mrs. R. C. Hudson, both carrying large flattish deep red flowers; fine for rock gardens.



SOBRALIA CLIFTONIÆ.

A beautiful species with white flowers, A.M., R.H.S., April 19. Messrs. Sander and Sons, St. Albans.

Collections of shrubs, hardy flowers, etc., were also contributed by Messrs. T. S. Ware, Lim., Feltham, who had a delightful colony of Androsace Chumbyi; Mr. C. Elliott, Six Hills, Stevenage; Messrs. H. B. May and Sons, Edmonton; Mrs. Lloyd Edwards, Bryn Dereg, Llangollen, who sent up a basket of the bright Saxifraga rosea superba; Mr. T. Kitley, Oldfield Nursery, Bath, whose chief exhibit was of the red-flowered Saxifraga decipiens grandiflora Bathoniensis— a terrible name for a pretty flower; Messrs G. Jackman and Son, Woking; and Messrs. Gilbert and Son, Dyke, Bourne, whose fulgent anemones were very effective.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, displayed a number of fine new seedling pelargoniums; three of the finest were Mrs. W. Pascoe, salmon-scarlet; R. C. Pulling, a huge salmon variety; and Bertram Cunningham, a beautiful orange shade—all single varieties. In Messrs. H. Cannell and Sons' display of cut pelargoniums the double rose-pink variety named Comte H. de Brettes stood out as remarkable in colour, size, and truss.

Messrs. James Veitch and Sons, Chelsea, showed the new Primula Maximowiczi, collected at Wutai-Shan, in China, by Mr. Purdom, at an elevation of 9,000ft.; it has rather small pendant flowers, of a deep-red colour. The Chelsea firm showed gerberas of many colours; a flowering plant of the curious stove climber, Aristolochia Sturtevanti, anything but sweetly scented; and a large-flowered pure white strain of Primula obconica that is very beautiful and useful. Camellias from out of doors are not uncommon in the South of England, but it is doubtful whether anyone so near London has such a fine outdoor collection as Lady Tress-Barry, of St. Leonard's Hill, Windsor, and her gardener, Mr. R. Brown, showed dozens of vases of blooms of these old-fashioned flowers, all culled from the open garden. Messrs. Dobbie and Co., brought brilliant violas from Rothesay, and we noted Maggie Clunas, Redbrae's Yellow, Moseley Perfection, Mrs. J. H. Rowland, and G. G. Murray, as eminently desirable varieties. In addition to roses and carnations Messrs. Stuart Low and Co., Enfield, showed neat bushes of Azalea elegantissima odorata, smothered with tiny pure white and delightfully fragrant flowers—just the sort of shrub for a sheltered rock garden.

ORCHID COMMITTEE.

Although no fewer than seven awards of merit were granted by the very largely attended Orchid Committee, there were few things of wonderful merit or interest. Very beautiful, however, was the new white Sobralia Cliftoni (A.M.) exhibited by Messrs. Sander and Sons, St. Albans; it has a few mauve markings in the throat, but is otherwise white. The same firm had Chysis bractescens and Miltonia St. Andre in fine form. The handsome Cattleya Empress Frederick was conspicuous in the group set up by Messrs. Charlesworth and Co., Haywards Heath, while amid many fine odontoglossums and dendrobiums their beautiful deep coloured Miltonia vexillaria Moensi was very prominent. The pretty and somewhat rare Miltonia Phalænopsis was shown by Messrs. J. and A. McBean, of Cooksbridge, their brightly marked form being named McBean's var. (A.M.) A wealth of dendrobiums came from Messrs. Stuart Low and Co., Enfield, with fine spikes of Oncidium Marshallianum above; and odontiodas and odontoglossums below. A fine plant of Odontoglossum nævium, and a good form of Cypripedium Helen II., were brought from Tunbridge Wells by Messrs. Armstrong and Brown. The rounded yellow-marked flowers of Odontoglossum Lawrenceanum Cobb's var., gained an A.M. for Mr. W. Cobb; it has rounded flowers of great beauty and distinction.

Mr. G. Day, gardener to H. S. Goodson, Esq., submitted Odontoglossum eximium var. Clarksoni, a superb red and purple beauty; and a grand spike of O. amabile var. Lord Carnarvon. Numerous interesting odontoglossums were shown by Mr. Stables, gardener to De Barri Crawshay, Esq., Sevenoaks, including O. regale Rosefield var. (A.M.), with deep brown purple markings, and the handsome O. Crawshayanum. Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, showed Cymbidium Lowianum Pitt's var., with a spike of thirteen fine flowers. Odontoglossum Rossianæ var. rubens (A.M.), from M. Henri Graire, St. Fuscien, Amiens, is a lovely light purple flower, with chocolate spots; O. crispum St. Fuscien (A.M.), from the same source, was also fine.

DAFFODIL COMMITTEE.

The daffodil lovers had a field day on this occasion, and feasted their eyes on the many beautiful new seedlings shown. The old method of naming the seedlings of one's own raising appears to have largely died out, and the newer method is to display the one or two flowers, as the case may be, under number, and sell it to some one who is willing to pay an enhanced price for the privilege of naming the variety after purchase.

The Rev. G. H. Engleheart, Dinton, Salisbury, displayed a superb lot of seedling daffodils, but as none of these were named it is useless to refer to them individually. Some of the new golden trumpets were beautifully refined flowers; Triandrus hybrids were delightful, and the orange-eyed and flat cupped varieties were superb.

Mr. A. Wilson, Bridgwater, had a set of exquisitely beautiful seedlings, chiefly under number, and his flowers of Draco, Crœsus, pale yellow, with orange cup; Gold Eye, Potent, and Horatius were very fine. Mr. Robert Sydenham, Birmingham, had a good bunch of the Golden Homespun. Mr. Watts, St. Asaph, showed unnamed seedlings, many of them with white trumpets. From the Lissadell Bulb Farm, Sligo, came lovely flowers of Incognita, Queen Maeve, White Queen, etc., and Messrs. Hogg and Robertson's exhibit, from Dublin, contained splendid blooms of Great Warley, Evangeline, Mrs. F. W. Moore, and King's Norton.

Messrs. Barr and Sons, Surbiton, had an unusually fine display of daffodils, etc., and among the former there were delightful flowers of Diana, Mrs. G. H. Barr, Furnace, Seraphim, Blazing Star—a very bright flower—Great Warley, and Eoster. A well set-up exhibit from Miss F. W. Currey, Lismore, contained fine vases of King Alfred, Lady of the Snows, Great Warley, Firebrand, and The Geraldine. Mr. H. F. Chapman, had a dainty display in which the poeticus varieties Horace and Ibis were good, while in the neighbouring exhibit from Messrs. Cartwright and Goodwin, Kidderminster, the bunch of Matthew Arnold (A.M.), a shapely solid white poeticus variety, was the centre of attraction.

In the competition for the Barr Daffodil Cup the Rev. G. P. Haydon, Westbere, Canterbury, easily outdistanced the Rev. Canon Fowler, Reading, with fine flowers, well set up, and representing the newer varieties, and some splendid new seedling forms with very shapely golden trumpets. Of course, everyone knows that Mr. Haydon has raised some of the best varieties now in commerce.

FRUIT AND VEGETABLE COMMITTEE.

There was little of special interest before this body. A few apples and pears were shown by Mr. Nicholls, gardener to Sir Mark Collett, St. Clere, Kemsing, Sevenoaks, and Messrs. J. Veitch and Sons, Chelsea, submitted early lettuces, radishes, cabbages, etc.

AWARDS OF MERIT.

No certificates were granted, but Awards of Merit were made as follows:—

To Odontoglossum Regale, from De Barri Crawshay, Esq., Rosefield, Sevenoaks. To Odontoglossum crispum St. Fuscien, from Mons. H. Graire, Amiens, France. To Sobralia Cliftonæ, from Messrs. Sander and Sons, St. Albans. To Miltonia Phalænopsis McBean's var., from Messrs. J. and A. McBean, Cooksbridge. To Odontoglossum Lawrenceanum Cobb's var., from Mr. W. Cobb, Rusper. To Odontoglossum Arnoldianum, from Messrs. Sander and Sons, St. Albans. To Odontoglossum Rossianæ var. rubens, from Mons. H. Graire, Amiens, France. To Narcissus poeticus var. Matthew Arnold, from Messrs. Cartwright and Goodwin, Kidderminster. To Hippeastrums Gereant, Calypso and Cardinal Wolsey, from Lieut.-Colonel Holford, Westonbirt, Tetbury. To Auriculas Warley and Roxburgh, from Mr. James Douglas, Great Bookham. To Primula ciliata, var. General Stewart, from Mr. Cranfield, Enfield.

MEDALS.

Gold.—To Lieut.-Colonel Holford (gardener, Mr. Chapman), Westonbirt, Tetbury, for hippeastrums; to Mr. James Douglas, Great Bookham, for auriculas.

Silver Gilt Flora.—To Messrs. R. and G. Cuthbert, Southgate, for flowering shrubs; to Miss F. W. Currey, Lismore, Ireland, for daffodils; to Messrs. Barr and Sons, Covent Garden, for daffodils and tulips; to Messrs. Stuart Low and Co., Enfield, for orchids.

Silver-Gilt Banksian. — To Rev. G. H. Engleheart, Dinton, for daffodils; to Mr. A. Wilson, Bridgwater, for daffodils.

Silver Flora.—To Mr. F. H. Chapman, Rye, for daffodils; to Mr. J. Cooper, Lissadell Bulb Farm, Sligo, for daffodils; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. Wm. Cutbush and Sons, Highgate, for carnations and flowering shrubs; to Messrs. S. Low and Co., Enfield, for roses and carnations; to Mr. W. H. Page, Hampton, for carnations; to Messrs. Storrie and Storrie, Dundee, for polyanthuses and auriculas; to Messrs. James Veitch and Sons, Chelsea, for greenhouse plants; to Messrs. Sutton and Sons, Reading, for cinerarias; and to Messrs. R. Felton and Son, Hanover Square, for gerberas and roses.

Silver Banksian.—To Messrs. R. H. Bath, Lim., Wisbech, for daffodils; to Messrs. Hogg and Robertson, Dublin, for daffodils; to Mrs. Bischoffsheim, Stanmore, for pelargoniums; to Lady Tress Barry, Windsor, for camellias; to Mr. H. Burnett, Guernsey; for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns and flowering plants; to Messrs. G. Mount and Sons, Canterbury, for cut roses; to Messrs. J. Peed and Son, West Norwood, for caladiums; to Mr. G. Prince, Longworth, for roses; to Mr. L. R. Russell, Richmond, for flowering shrubs; to Messrs. R. Wallace and Co., Colchester, for hardy plants; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; and to Messrs. Frank Cant and Co., Colchester, for roses.

Cornwall Daffodil and Spring Flower Society.

This society, which was incorporated fifteen years ago, has the honour of distinguished patronage, for its patroness is Her Majesty Queen Alexandra, while Her Royal Highness the Princess of Wales is president, and among the vice-presidents are to be found the names of the Earl of Mount Edgcumbe, the Viscountess Falmouth, and Sir A. P. Vivian, K.C.B., while T. A. Dorrien-Smith, Esq., the King of the Isles of Scilly, is the chairman of committee. From its inception the spring shows of this society at Truro have been of a high order of merit, but there is no doubt that the show lately held has eclipsed all that have preceded it. The entries were larger than any that had been previously received, and the competition in all classes was exceedingly keen, while the exhibits were conspicuous for their excellence. The Hon. John Boscawen has been hon. secretary since the formation of the society, and under his skilful management all the arrangements have invariably been carried out without a hitch, and there has never been as much as a complaint. The show was held in the great Market Hall at Truro on April 12, and was an eminently successful one. The band of the Royal Marines from Plymouth discoursed sweet music during the afternoon, and this year, being partitioned off, their audience did not incommode the viewers of the flowers. Soon after midday the hall rapidly filled, and visitors from all parts of the kingdom were present, though, naturally, the county provided the largest contingent.

The seedling narcissi in the premier class were exceedingly beautiful flowers, though it is a pity that they were only numbered and not named. Cornwall is a county where the rare and tender shrubs from the warmer portions of the globe may be grown in the open without protection, and the collection of these to be seen at the spring show is a revelation to dwellers in the colder districts. This year the show of hard-wooded flowering shrubs was better than at any previous exhibition. Mr. J. D. Enys, who cultivates the New Zealand forget-me-not, Myosotidium nobile, better at Enys than it is grown anywhere else, sent two splendid specimens in tubs to the show, which were universally admired, and were awarded a Cultural Commendation. Miss Gundry was given a First-class Certificate for a collection of water-colour sketches of flowers and garden scenes, which had before received a gold medal from the Royal Horticultural Society.

DAFFODILS.

Thirty varieties of daffodils in commerce: First prize, Mr. E. H. Williams. Thirty varieties of daffodils in commerce, or not in commerce: First prize, Mr. J. C. Williams. This was a splendid stand, entirely composed of seedlings raised by their owner. There were many lovely flowers, the Parvi-coronati being especially excellent. For one of these, No. 244, Mr. Williams received a First-class Certificate, and for No. 288 and 11F, Awards of Merit. In the stand there was a splendid golden trumpet, larger than King Alfred, a very beautiful drooping white trumpet, and an immense medio with light yellow perianth and pale-orange cup. Some of the Parvi-coronati with brilliant spreading orange-scarlet cups, were very handsome. Mr. P. S. Williams's second prize stand was little behind the winner, and he received an Award of Merit for his golden daffodil Sunflower. In the next nine classes the price of the bulbs was limited to 10s. Six Magni-coronati: First prize, Miss Clarice Vivian. Eight Medio-coronati: First prize, Miss Clarice Vivian. Three Leedsi: First prize, Mrs. Soltan-Symons. Six Parvi-coronati: First prize, Miss Clarice Vivian. Fifteen any section: First prize, Miss Rhoda Williams. Finest bloom Magni-coronati: First prize, Miss Nowell-Usticke with King Alfred. Finest bloom Medio-coronati: First prize, Mrs. Soltan-Symons with White Lady. Finest bloom Parvi-coronati: First prize, Miss Mabel Williams with Beacon. Finest bloom poeticus: First prize, Mrs. Soltan-Symons with Horace.

Six Magni-coronati: First prize, Mr. E. H. Williams. Six Medio-coronati: First prize, Lady Margaret Boscawen. Six Leedsi: First prize, Mr. E. H. Williams. Six Parvi-coronati: First prize, Mr. E. H. Williams. Three doubles: First prize, Miss Clarice Vivian. Fifteen any section: First prize, Miss Clarice Vivian. Finest bloom Magni-coronati: First prize, Mr. P. D. Williams with Lord Roberts. Finest bloom Medio-coronati: First prize, Mr. E. H. Williams with Homespun. Finest bloom Parvi-coronati: First prize, Miss L. Williams with Lavender, a very pretty little white flower with flat white crown edged with pale orange. Finest bloom English-raised Magni-coronati not in commerce: First prize, Mr. E. M. Crosfield with Gyrfalcon, a superb white trumpet, certainly the finest flower in the show.

Finest bloom English-raised Medio-coronati not in commerce: First prize, Mr. P. D. Williams with an unnamed white. Finest bloom, English-raised Parvi-coronati, not in commerce: First prize, Mr. E. M. Crosfield with No. 143, cream-white perianth, flat yellow cup, edged with broad border of orange-scarlet. Finest bloom English-raised poeticus not in commerce: First prize, Mr. P. D. Williams with a good white crimson-eyed flower. Group of daffodil seedlings that have not been in commerce four years: First prize, Mr. E. M. Crosfield, with an excellent stand, containing Bedouine, sulphur-white perianth, deep yellow cup, edged with bright orange; Spot, red, pale sulphur perianth, brilliant orange-scarlet flat cup; Gaybird, pale primrose, yellow flattened cup edged with orange; Vasco, white trumpet; No. 139, white with golden, flattened cup, margined with wide border of orange-scarlet; No. 134, a poeticus with yellow, crimson-margined eye.

Three bunches anemones: First prize, Mr. R. Fox. One bunch Anemone fulgens: First prize, Miss E. Vivian. Three polyanthus plants: First prize, Miss Catherine Boscawen. Three primrose plants: First prize, Mrs. Paull. Three double primrose plants: First prize, Miss J. E. Lord. Twelve varieties spring flowers: First prize, Mr. P. D. Williams with Muscari Heavenly Blue, Primula rosea, P. denticulata, Viola papilio, Anemone pulsatilla, Muscari azureum amphibolus, Caltha platypetala, Ourisia macrophylla, Tulipa odorata major, T. præstans, Iris bucharica, pink Anemone blanda.

Six varieties spring flowers: First prize, Rev. A. T. Boscawen with superb flowers of Iris tingitana, which received cultural commendation: Tulipa Clusiana, T. saxatilis, Fritillaria verticillata, Muscari conicum, and Erythronium revolutum Pink Beauty. Collection of spring flowers, arranged as a rockery, 3ft. 6in. square: First prize, Mrs. Powys Rogers with a charming little rock garden, in which were Gentiana acaulis, Viola alba, Aubrietia Dr. Mules, Anemone ranunculoides, Primula rosea, P. cashmeriana, Sanguinaria canadensis, Viola gracilis, Primula Sieboldi, Phlox amœna, Corydalis cheilanthifolia, Dentaria enneaphylla, Ornithogalum nutans, and blue and hose-in-hose primroses.

Finest plant of rhododendon in flower: First prize, Mr. J. C. Danbuz. The best group of rhododendron blooms: First prize, Mr. D. H. Shilson. Six trusses of rhododendrons: First prize, Mr. R. Fox. Three trusses of rhododendrons: First prize, Mr. D. H. Shilson. Finest truss of outdoor rhododendron: First prize, Mr. T. B. Bolitho with R. grande. Finest truss of Sikkim rhododendron: First prize, Mr. J. C. Williams. Finest truss of rhododendron under glass: First prize, Mr. D. H. Shilson with R. Nuttalli. Three large jars of outdoor rhododendron sprays: First prize, Mr. D. H. Shilson. Six blooms camellias out of doors: First prize, Mr. J. C. Williams. Six blooms camellias under glass: First prize, Mr. J. C. Danbuz. Finest bloom camellia: First prize, Mrs. J. Williams. Three vases acacia: First prize, Mr. C. Hext.

Twenty varieties hardwooded flowering shrubs: First prize, Mr. T. B. Bolitho with Sutherlandia frutescens, Magnolia Soulangeana, Grevillea Thelemanniana, Cerasus Watereri, Boronia heterophylla, Skimmia Fortunei, Cydonia Simoni, Acacia Riceana, Viburnum Carlesi, Clianthus puniceus, Pernettya ciliaris, Polygala opposititolia, Jasminum primulinum, Embothrium coccineum, Barosma betulina, Prunus pendula, Lopesia miniata, Enkianthus japonicus, Camellia reticulata, Andromeda formosa. The competition in this class was very close, and there were good things in the other stands, such as Acacia ulicina, A. leprosa, A. obliqua, A. diffusa, Staphylea colchica, Boronia megastigma, Calceolaria violacea, Clematis indivisa lobata, and Lapageria rosea. In the well-filled class for six varieties of hardwooded shrubs the first prize was awarded to Mr. P. D. Williams, who showed Cytisus racemosus, C. proliferus, Exochorda grandiflora, Cydonia Knap Hill, Erica australis (cultural commendation), and Viburnum Carlesi.

NURSERYMEN'S CONTRIBUTIONS.

Nurserymen's exhibits did much to brighten the show. Messrs. R. Veitch and Son, Exeter, received an Award of Merit and First-class Certificates for Saxifraga bathoniensis and Nephrolepis magnifica. Among other plants on their stand were Diosma capitata, Grevillea alpina, Correa ventricosa, Saxifraga Clibrani, Valeriana arizonica, Cytisus Beani, Acacia cultriformis, Rhododendron racemosum, R. Dr. Stocker, Viburnum Sieboldi, Azalea Yodogame, Gerbera Jamesoni, and Eriostemon neriifolius. The Devon Rosery, Torquay, who received an Award of Merit, staged a fine specimen of Petræa volubilis and a number of pot roses in full bloom, amongst these being Lady Moyra Beauclerc, Hon. Ina Bingham, Countess of Derby, Prince de Bulgarie, Mrs. W. J. Grant, Madame Pere Cochet, Mrs. G. W. Kershaw, Celia, Dr. Felix Guyon, and Maharajah. Mr. G. Reuthe, Keston, had an Award of Merit for a number of choice subjects. Messrs. Barr and Sons, King Street, Covent Garden, had an Award of Merit made in their favour for a splendid collection of daffodils, amongst which were Flamingo, Ibis, Mrs. G. H. Barr, Peter Barr, Bedouin, Ethelbert, Beacon, Epic, Homespun, Mermaid, Incognita, Lucifer, White Queen, Fire Flame, Cœur de Lion, Waterwitch, and others. Messrs Heath and Son, Cheltenham, received an Award of Merit for Saxifraga muscoides Gloria, a fine hybrid, deep crimson in colour, Sempervivum arachnoideum, Alopecurus lanatus, Omphalodes Luciliæ, Stylophorum diphyllum, Sedum ternatum, Primula muscanioides, and other rock plants. Messrs. G. Bunyard and Co. Maidstone, who had an Award of Merit made in their favour, displayed a splendid collection of apples and pears.

Bournemouth Horticultural Society.

The third annual exhibition of spring flowers was, as usual, held in the Winter Garden Pavilion, and attracted a very large number of visitors. The pavilion is an ideal building for an exhibition of this kind, being an immense glass structure resembling a huge conservatory, in which it is possible to arrange the exhibits in a very pleasing manner. The executive committee did not fail to do justice to the exhibits on this occasion, with the result that the public, when the show was opened by the Mayoress of Bournemouth (Mrs. G. E. Walker Bridge) found a veritable feast of flowers awaiting them. In springtime one expects to have fresh flowers, though they naturally fade at this season as well as at others; but the freshness of all flowers staged at this show was so marked as to impress the looker-on very much, as well as the high quality of the flowers and plants did.

SOME PROMINENT EXHIBITORS.

Messrs. G. Watts and Sons, Palace Nurseries, Bournemouth; Mr. T. K. Ingram, Parkstone, Dorset; Mr. Usher, of sweet pea fame, gardener to Sir R. Baker, Bart., Blandford; Mr. W. Shave, gardener to the Dowager Lady de Tabley, Berry Court, Bournemouth; Mr. Heath, gardener to G. G. Russell, Esq., Bournemouth; Mr. C. Pearce, gardener to Mrs. Ormond, Bournemouth; and Mr. Slark, gardener to G. J. Fenwick, Esq., Crag Head, Bournemouth, were prominent exhibitors and successful prize-winners.

COMPETITIVE EXHIBITS.

The chief class was for a group of miscellaneous plants arranged for effect, to occupy a space of 12ft. by 8ft. Messrs. G. Watts and Sons were the winners with a good group, the one fault being the overcrowding, which was somewhat apparent. A fine palm and climbing roses filled the centre, and were surrounded by liliums, fuchsias, hippeastrums, azaleas, dielytras, lilac, and hydrangeas; an exquisite edging was formed with tiny azaleas and ferns. Mr. Slark was a good second also with a fine group of splendidly-grown plants. With a palm in the centre, bamboos at each of the four corners, grasses and ferns as an edging, with the centre filled in with carnations, narcissi, deutzias, and cinerarias. The third award went to Mr. Ingram, who put up an extremely light, pleasing group, of which liliums formed the principal feature.

Mr. Usher had the best table decoration. Only narcissi flowers were allowed, but any foliage. With the narcissi, asparagus sprays and the crimson leaves of roses were agreeably associated. Mr. Shave was a very close second. Miss Taylor, of Salisbury, had a pretty table, and was awarded third place, her Panicum variegatum and Narcissus poeticus looked lovely.

Mr. T. K. Ingram won premier honours for six Azalea mollis, six Azalea indica, six pots of polyanthus narcissi, and twelve pots of tulips. Messrs. G. Watts and Sons were second in the first three classes, and Mr. C. Pearce in the last one. For twelve pots of narcissi Mr. Usher won, followed by Messrs. G. Watts and Sons. The last-named firm secured first place with a grand lot of hyacinths, twelve pots being staged. Mr. F. W. Welch, Park Nurseries, Bournemouth, was second, and Mr. Ingram third. Messrs. Watts and Ingram were first and second respectively for lily of the valley.

For a collection of narcissi, eighteen varieties, distinct, Mr. Usher was awarded first honours, and Golden Spur, Madame de Graaff, Victoria, Emperor, Glory of Leiden, and Maximus were the best flowers. The Messrs. Watts came second, and Mr. Wadey, Wimborne, was placed third for a neat collection. In the class for five blooms of trumpet varieties, Mr. Usher was first. The Messrs. Watts were successful with grand blooms of medium crowned varieties. For four varieties of carnations, with own foliage, nine blooms of each, Mr. Usher was placed first, having superb flowers of Britannia, Harlowarden, Victory, and Mrs. Burnett. Messrs. Ingram and Watts were second and third respectively, the last-named having small, but very fresh blooms.

Miss Martin, Messrs. Watts, and C. Wadey were the winners in this order, for beautiful bouquets. The special prizes offered by various firms, were well competed for, as also were those offered by the society for spiræas, cinerarias, primulas, cyclamen, deutzias, and mignonette.

THE CHILDREN'S SECTION.

A new feature at the Bournemouth Flower Show has been inaugurated this spring in the form of classes for children under the age of fourteen years. The chief classes provided are vases of cut flowers, buttonholes, pots of mustard and cress, polyanthuses, and primroses in flower pots, baskets of daffodils, coloured drawings of daffodils with foliage, and black and white sketches of lily of the valley and a single leaf.

Two hundred and twelve entries were made, and there was not one bad exhibit; all were of good quality, and the result has been to cause a more wide-spread interest in gardening in the district.

NON-COMPETITIVE EXHIBITS.

These were numerous and of high merit. Gold medals were awarded to Messrs. J. Cypher and Sons, Cheltenham, for orchids; Messrs. Sutton and Sons, Reading, for cinerarias; Mr. M. Prichard, Christchurch, for rockery and alpine plants; Mr. Robert Chamberlain, Bournemouth, for floral designs; and Mr. Pursglove, head gardener at the Winter Gardens, for a miscellaneous collection of plants. Silver medals were awarded to Messrs. Heath and Sons, Cheltenham, for alpine plants; Messrs. Young and Co., Hatherley, for carnations; and Messrs. R. Sydenham, Lim., Birmingham, for bulbs in fibre.

East Anglian Horticultural Society.

The monthly meeting of this flourishing society was held on the 13th inst. at the Boar's Head Hotel, Norwich, Mr. T. B. Field, gardener to the Baroness Berners, Ashwelthorpe, presiding. Several new members were enrolled. A paper was read by Mr. J. H. Clements, The Woodlands, Norwich, upon "The Rock Garden." Mr. Clements said it was frequently stated that we could not grow the alpines as well as they did in their native surroundings. This, to him, was an erroneous idea, for, with the proper conditions given in the preparation of the rockery, they would flourish as well in our lowlands as they did in their mountainous homes. The position of the rockery required some thought. A large number of gardeners thought that just anywhere would do for this, but this was a mistake. The position should be somewhat sheltered, but open, that the plants could have the fullest benefit from light and air.

Mr. Frank Neave, Lingwood, spoke of the pleasure he had derived from his rock garden, remarking that he could find something in flower at all times of the year. Mr. H. Perry said that whilst the choicer alpines would do in the pure country air, it was difficult to get them to make a display when associated with dwellings, as was the case in town gardens. Mr. E. Peake thought the rock garden should be a place of large, bold groups of each plant, not little patches of "this and that," which spoiled the effect. Mr. L. Smith (Shotesham Park Gardens) said no garden nowadays was complete if it did not have its rock garden. He detailed his experiences in the formation of a large one this past winter, and of which he had great hopes. Mr. J. Clayton, of Messrs. Daniels Brothers, Lim., Norwich, spoke strongly in support of the rock garden; he said the five years he spent in his early gardening career in the renowned rockery of Messrs. Backhouse and Co., impressed itself largely upon his mind as a place beautiful, and he persuaded all who could do so to have a rock garden. Mr. Burtenshaw, Mr. Powley, and the President also added some useful remarks, the latter according Mr. Clements thanks for contributing the paper.

The display of competitive and non-competitive exhibits were a pretty feature, and also added to the educational value of the meeting. Messrs. Daniels Brothers, Lim., Norwich, staged forced shrubs in variety. Hobbies, Lim., Dereham, sent up two new dwarf polyantha roses, named Orleans and Mrs. Taft, which, although coming out from different Continents, were somewhat similar. Mr. Frank Neave, Lingwood, had some very fine polyanthus. In the fruit section the outstanding feature was the dish of early strawberries brought up by Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, Norwich; they were remarkable both in size and colour.

Bournemouth Gardeners' Association.

On Thursday, April 14, about fifty members journeyed to the Poole Marais garden to inspect the produce grown under the system of French intensive culture, by kind permission of the manager, Mr. G. Chapman. Mr. Fribeau, the able and courteous head gardener, met the members at the entrance to the gardens, and extended to them a very warm welcome. No time was lost in commencing the close inspection of the array of glass-covered frames and the cloches, which covered a little more than one acre of ground. The whole of the garden—in all extending to nearly three acres—is enclosed by a high wood fence, and on the north and east sides there is afforded much shelter by woods and low hills.

Mr. Fribeau first directed attention to the frames filled with radishes, nineteen varieties being grown. The bulbs were of good average size, but the tops were exceptionally small. All the crops are grown in cold beds, chiefly, we believe, owing to the difficulty in obtaining the necessary manure. The glass lights had been taken off the turnips; this crop looked remarkably healthy, as the lettuces, of which many thousands are grown. A cabbage variety, named Ression, was very fine, each specimen being firm, large, and well hearted. Round-seeded spinach was doing well in other frames, in which five cauliflowers were growing under each light.

Another system of cropping was shown. Four crops were taken from the same frame in the following order: First, radishes; second, lettuces; third, spinach; and, lastly, cauliflowers. These were so sown, or plants put in, that all were growing together at the same time. Carrots are extensively cultivated, and very nice roots were available. Melons, in small 60's, were plunged in frames in an inner enclosure, other plants being bedded out in the centre of the frames. Many thousands of celery plants were also growing in this part of the garden, and, later on, Mr. Fribeau said, they would be transplanted into other frames, and finally blanched under mats, no earthing up being done. Seedling tomatoes were also in evidence; all these were, in due course, to be planted in the open. Last year was an adverse one for outdoor tomatoes, but Mr. Fribeau told the members that he gathered two tons of fruit, which must have represented good cultivation.

In the open quarters a splendid crop of early cabbages were growing. From one batch, planted out on January 16, cabbages were ready to cut at Easter. A few specimens were left over of a variety named Ox-Heart; the young plants were put out on November 14. The other variety was Early Etamps. This is a quite distinct cabbage; the outer leaves forming the heart are more or less tinted with a deep purple on the back near the point.

The visit was a very pleasant and instructive one, and before the members returned home they passed a very hearty vote of thanks to Mr. Chapman, the manager, and Mr. Fribeau, the head gardener.

British Gardeners' Association.
(London Branch.)

The monthly meeting of the above branch took place at Carr's Restaurant on Thursday, April 14, Mr. E. F. Hawes in the chair.

The financial statement made regarding the concert held on March 19 showed that the total receipts from sale of tickets amounted to £3 19s. 6d., the expenses incurred £1 7s. 8d., leaving a balance of £2 11s. 10d. It is proposed to devote two guineas of this sum to the Saturday Hospital Fund, the remainder to be used for carrying on the work of the branch.

The most interesting event of the evening was an address by Mr. Parrott, on "Specimen Plants for Lawns and Flower Beds." In his opening remarks the speaker drew attention to the great changes that have been made in summer bedding during the past few years. We are, he said, no longer content with large masses of pelargoniums in scarlet, pink, or white, or with straight rows of calceolarias edged with blue lobelia. We now adopt a more artistic style of bedding that is far more natural and pleasing in effect. By our present methods we are able to make use of plants which years ago we should have been afraid to take out of our greenhouses. With a greater variety of plants at our disposal we are able to adopt different methods of arranging them each season, and thus avoid the monotony that existed in former years.

The following is a list of plants selected as being most suitable for training into large specimens: Ivy-leaved pelargoniums, zonal and scented-leaf pelargoniums, heliotropiums, plumbagos, hydrangeas, lantanas, statice, tropæolums, streptosolons, cassias, and shrubby calceolarias.

The time taken to make good specimens was said to be from one to three years. The speaker gave details of culture suited to the requirements of the different kinds selected from the cutting onwards, together with instructions for arranging them to the best advantage, either as specimens upon the lawn or as groups in flower beds.

A hearty vote of thanks to Mr. Parrott for his interesting and highly instructive address brought the meeting to a close.

United Horticultural Benefit and Provident Society.

The April meeting of this society was held at the Royal Horticultural Hall, Vincent Square, S.W. Mr. Charles H. Curtis presided. The minutes of the last meeting were read and confirmed. The number of new members elected during the last three months was 32. Two members were transferred from the lower to the higher scale. A cheque for £13 3s. 5d. was drawn for a lapsed member. The usual quarterly payments were made to members over 70. The amount of sick pay for the past month was £35 9s. The annual report and balance-sheet has been posted to honorary and benefit members. Any member not having received one is requested to write to the Secretary.

OBITUARY.

◆

MR. JOHN HAY.

We regret having to record the death, at Aberdeen, of Mr. John Hay, who was a gardener of the old school, and had reached the patriarchal age of 75 years. Born in the parish of Culsalmond, Aberdeenshire, Mr. Hay served his apprenticeship with the father of the present Convener of the county of Aberdeen, House of Newton, Aberdeenshire, from whence he was engaged at several county houses, ultimately settling down for a goodly number of years at [illegible] House, Lumphanan, Aberdeenshire. Here Mr. Hay also undertook the duties of forester. After his service there Mr. Hay came to the city of Aberdeen, when he was appointed head gardener to the then Lord Provost, Mr. Nicol. On the demise of Lord Provost Nicol, Mr. Hay went to [illegible] House, Aberdeen, with the late Mr. [illegible]. On leaving this situation, Mr. Hay undertook the duties of superintendent of [illegible] city churchyard of Aberdeen—one of the exquisitely beautiful oases in a densely-populated centre of the city of Aberdeen. Here Mr. Hay remained for a number of years, his work and worth being highly appreciated by the City Council of Aberdeen, [illegible] have the oversight of this churchyard. Mr. Hay was a skilful gardener, and was greatly respected by his confreres.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

DISBUDDING PEACHES AND NECTARINES.—C. L. B., Watford: The matter was dealt with in our issue of April 16, p. 308.

A POLITE CAUTION.—L. T. M., Leamington: The following lines occur to us as suitable for your particular circumstances:

Welcome to view the beauty of this place,
Raised by the gardener's skill on nature's face,
Then feast your eyes, for 'tis of pleasures full,
But no rude hand may fruit or flowers pull;
For pulling fruit without the Gardener's leave
Mankind was ruined by our Mother Eve.

ISMENE AMANCÆS.—H. D., Hull: This handsome plant is half-hardy, although it may survive the winters unprotected in especially warm southern gardens. If you treat it as a cool greenhouse plant you should succeed with it. Provide it with fairly rich, but well-drained soil, and give water with great care. Ismene amancæs is popularly known as the Lily of the Incas; it is somewhat rare in cultivation now, but was frequently seen in collections five and twenty year ago. The flowers are yellow, borne in large umbels, and very fragrant.

HORTICULTURAL SOCIETIES AND THEIR SECRETARIES.—T. H. B., Stourbridge: The most useful and complete list of horticultural societies and their secretaries, is to be found in the "Gardening Year Book for 1910," which contains an immense amount of information on other matters relating to the garden, you may obtain, post free, for 1s. 2d., from the Gardeners' Magazine Office, 148, 149, Aldersgate Street, E.C.

FRUIT SHOW AT HEXHAM.—M. E. M., Derby.—The fruit show to be held at Hexham in conjunction with the Congress referred to on p. 297, of our issue for April 16, will be judged under the Royal Horticultural Society's Code of Rules for Judging, 1909 edition. The latter may be obtained from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, for 1s. 6d. post free; and schedules of the Hexham Show may be obtained gratis from Rev. J. Bernard Hall, Dalston, Cumberland.

FAILURE WITH BULBS.—G. B., Guildford: The trouble is not in the soil, but on it. The bulbs are healthy, and the roots are good, but the growth has in every case been damaged just above the ground level. We cannot tell what causes the damage, but a careful study of the surroundings might throw some light upon the matter. We remember that some years ago a correspondent could not understand how it was that in a certain flower bed spring-flowering bulbs were never a success, until we suggested cats, and it was found that cats frequented the bed during the sunny hours, and, besides damaging the advancing growth, made the ground surface very foul. The bed was dug, thoroughly limed, and allowed to remain rough (but netted over) for a few weeks, and then summer flowers were planted. The bed was again netted over, and the plants were a success. Later in the season the netting was removed and great care was taken to prevent cats from settling on the bed, with the result that these feline pests found matters too uncomfortable, moved to some other rendezvous, and there was no further trouble as far as that bed was concerned. We do not say that cats are the cause of your trouble, but suggest that the cause is not in the soil.

EMPLOYMENT AT KEW.—H. G.: For full particulars of employment at Kew you should write to the Curator, Royal Gardens, Kew, Surrey, stating age and experience. You will then receive a form to fill up and return, and then await a vacancy.

TULIPA CLUSIANA.—F. A., Missenden: This beautiful species needs no special treatment, but it is more at home in the well-drained soil of the rock garden than in the border or flower bed. It is a delightful plant for pot culture when allowed to grow in a cold frame or cool greenhouse. As a general rule the flowers are silvery white, with a violet base to each segment. Sometimes the flowers are more or less marked with rose. The daintiness of the blooms has led to the popular title of The Lady Tulip.

INTERNATIONAL HORTICULTURAL EXHIBITION.—W. K., Surrey: The members of the Executive Committee of the International Horticultural Exhibition, held at South Kensington, in 1866, were: Sir C. Wentworth Dilke, Bart., chairman; Mr. J. Jackson Blandy, deputy chairman; Sir D. Cooper, Bart., treasurer; Mr. T. Moore, Dr. R. Hogg, LL.D., and Dr. B. Seeman, secretaries (owing to the last-named having to go abroad early in the year Dr. Masters became the secretary of the botanical side of the gathering); Professor Bentley and Messrs. W. Bull, E. Easton, C. Edwards, J. Fleming, R. Fortune, J. Gibson, J. Lee, M. T. Masters, M.D., T. Osborne, W. Paul, J. Standish, C. Turner, H. J. Veitch, and B. S. Williams.

LILY BULBILS.—H. P. B., Worcester: Now that the bulbils have commenced to grow keep them in a warm greenhouse, and let them have plenty of light, but a little

shelter from strong sunshine. Keep a sharp look-out for greenfly, because if this pest obtains a footing it will injure the tender leaves and so kill or seriously retard the little plants. Fumigate the house every week or ten days. In the summer a frame will suffice for protection. As the plants progress, give them a top-dressing of leaf-mould and old dried cow manure.

MIGNONETTE.—F. N. C., Dorchester: Mignonette is one of the most desirable of annual flowers, and failures with it always prove very disappointing. The seeds should be sown in March or April, and the best positions for mignonette are in mixed beds and borders. The seed must not be scattered all over the surface, and the plants be allowed to run riot among the other occupants, or to crowd each other in a manner that will render perfect development an impossibility. The best course is to grow them in clumps, and we suggest that in the selected positions a circular drill be drawn with a diameter of fifteen inches, and to a depth of about one and a-half inches. In this the seed must be thinly distributed, and when the seedlings are well above the surface all the plants, with the exception of three or four of the strongest, must be drawn out. As a matter of course, the plants remaining should be left at equal, or as near as may be, distances apart. By this simple course of procedure, fine clumps are obtained. In sowing otherwise than in drills, the seed should be distributed thinly, and in all cases the thinning of the seedlings should be proceeded with at intervals until all that are not required have been removed. A plant of mignonette will, in good soil, fill a space of fully twelve inches in diameter, and if this fact be borne in mind, it will be easy to remember that at the final thinning the plants should be from ten to twelve inches apart each way. With reference to the preparation of soil for mignonette, it may be stated that they require a moderately rich medium, but not one that contains an excess of manurial matter. If the soil is in an impoverished condition the growth will be weak, the flower spikes small, and the season of bloom very short. On the other hand, if manure is so liberally used as to render the soil excessively rich, the growth is unduly luxuriant, and the production of flower spikes unsatisfactory.

DECAYED CYPRIPEDIUM. — G. O., Leeds: Overwatering is the cause of the trouble. After potting it you should have kept the plant in a warm moist house, giving only just sufficient water to keep the soil moist; indeed, if the compost was moist at potting time little water would have been necessary until new roots began to form.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

H. R. S., Reading.—1, Francisea calycina; 2, Cissus discolor.

A. O. G., Leeds.—1, Calceolaria Burbidgei; 2, Primula frondosa; 3, Narcissus Johnstoni; 4, Pteris tremula.

N. T. S., Godmanchester.—1, Prunus triloba; 2, Adonis vernalis; 3, Anemone blanda; 4, Forsythia suspensa.

GARDENING ENGAGEMENT.

Mr. H. Collier, for the past three years foreman at Rolleston Hall Gardens, Burton-on-Trent, has been appointed head gardener to Sir Oswald Mosley, Bart., at Rolleston Hall. Mr. Collier succeeds Mr. George Woodgate, who is retiring from the management of these gardens owing to impaired health, after sixteen years' service.

TRADE NOTE.

Of the many remedies in daily use for the destruction of rats and mice there is none which obtains or deserves better suppport than "Liverpool" Virus. In addition to testimony from various parts of the United Kingdom of the satisfactory results obtained from its use, it has been employed with the best effect in such distant parts of the earth as India, Malay, Australia, South Africa, and South America. Its chief recommendation lies in the fact that it is always effective when carefully used, but it possesses additional merits in being prepared ready for use by English scientists at the Liverpool Institute of Comparative Pathology, where the profits of its manufacture are devoted to further research. We have used the "Liverpool" Virus with much success.

CATALOGUES RECEIVED.

ACME CHEMICAL COMPANY, LIM., VALE ROAD, EAST, TONBRIDGE.—A descriptive list of fungicides and insecticides, shading material, hose, etc. "Fumerite," an exterminator of pests in the soil is a speciality.

HEATH AND SON, CHELTENHAM.—An unusually complete list of perennial plants for alpine gardens, herbaceous borders, and water gardens. The list is descriptive and brief cultural details are given.

WM. COOPER AND NEPHEWS, BERKHAMSTED.—Under the title of "The Spraying of Fruit Trees" this firm has issued a little pamphlet dealing with the why and the wherefore of spraying. The use of V.1 and V.2 spray fluids is explained, and at the end of the booklet "Weedicide" is brought into notice, and the very useful can, with its specially constructed rose for distributing the weed killer is illustrated.

H. N. ELLISON, WEST BROMWICH.—A price list of popular ferns, palms, hand lights, etc.

JAS. STREDWICK AND SON, SILVERHILL PARK, ST. LEONARDS. This freely illustrated catalogue is devoted very largely to the fine cactus dahlias raised at St. Leonards.

HARLAN P. KELSEY, SALEM, MASS, U.S.A.—A profusely illustrated catalogue of the principal American hardy plants cultivated in the Highlands Nursery, North Carolina. Rhododendrons, Andromedas, and Kalmias, are a special feature.

PERMANENT NITRATE COMMITTEE, FRIARS' HOUSE, NEW BROAD STREET, E.C. The sixth edition of "How to Use Nitrate of Soda" is full of practical hints for the profitable application of nitrate of soda as a fertiliser for root and farm crops.

THOMAS S. WARE, LIM., FELTHAM, MIDDLESEX. A special catalogue of great present interest, as it is devoted to dahlias, bedding plants, begonias, early chrysanthemums, etc.

M. V. SEALE, SEVENOAKS.—A handy, descriptive list of dahlias, including a number of novelties in the several sections.

W. DUNCAN TUCKER AND SONS, LIM., 27, CANNON STREET, E.C.—Under the title of "Some Notes on Caloriculture" this firm issues a pamphlet dealing with their new system of forcing by means of sharply pitched double-glazed, bottom-heated houses. The matter is of much interest.

Checking the Wart Disease of Potatoes.—Some experiments are recorded in the current issue of the "Journal" of the Board of Agriculture, which prove that the Wart Disease or Black Scab of potatoes can be checked to some extent by planting seed tubers that have been greened by exposure to light. Six potatoes that had been "greened" by exposure for a period of six weeks, counted from the time they were lifted, and six that had been kept in darkness for an equal period were selected. The greened potatoes had short green sprouts, whereas the sprouts on the potatoes kept in darkness were quite colourless and also short. The twelve potatoes were planted in pairs—one greened and one ungreened—in soil that had been thoroughly inoculated with the fungus causing the wart disease. After an interval of six weeks, the potatoes were examined, when five of the ungreened ones were found to be infected with the fungus. The six greened tubers were free from infection, with the exception of one sprout that had developed since the tuber was planted. Infection of a potato is only possible through the eye, and then only when the sprout is quite young, hence when the tubers were examined, all had passed the stage of possible infection, and thus represented the percentage of immunity due to greening.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Spring Flowers.

There is no occasion for surprise that the flowers intimately associated with the season of spring should ever have been favourites with the poets, or that they should have sung their praises in some of the most beautiful lyrics that have a place in English literature. Even the most prosaic of individuals can hardly fail to have their thoughts stirred to the innermost depths by the manifold and wondrous charms of the native and exotic plants that so freely yield of their floral wealth during the spring months. From the opening days of spring until its close there is a continuous procession of flowers, all more or less beautiful, to which bulbous and fibrous-rooted plants, and trees and shrubs contribute liberally, and afford a succession of delights to those who fully appreciate Nature in her various moods. However much may be enjoyed the flowers of summer or of autumn, it is doubtful whether the charms of the most beautiful of them make so strong an appeal for admiration, or whether the interest in them is so readily quickened as in the case of those that belong to the spring. This, perhaps, is best explained by the fact that, while the community as a body admire summer and autumn flowers, they love those of the preceding season. It would, indeed, be surpassing strange were the latter not regarded with some degree of preference, seeing that they give brightness and beauty to garden and plantation that for some months have presented a bare and somewhat desolate appearance, and their development associated with the expansion of the tender green leaves of trees and shrubs, and with the melody of our feathered songsters. The taste of owners of gardens for spring flowers is no new thing, but it has been more marked of late years than was for a considerable period the case, and gardens have been made more interesting and beautiful at this season of the year. When the free use of tender bedders in the production of summer displays of flowers was popular spring-flowering plants were in large numbers utilised in beautifying the beds and borders for some eight or ten weeks before their summer occupants could with safety be transferred to their summer quarters. Then for a time spring flowers were less freely used in the production of colour effects, in some cases owing to the supposition that hardy herbaceous plants were all-sufficient, and in others to the reduction of the labour bill. Happily, they have been once more restored to their proper position as aids in rendering the garden beautiful, and they are now used with a freedom and taste of which past generations could not have had an adequate idea. Many plants that obtained favour in the past are still popular, but, with few exceptions, they have been greatly improved either in habit, freedom of flowering, or effectiveness of colour. The colours of the aubrietias, which constitute a most valuable group for massing in beds and borders, as well as for clothing rockery slopes, have been greatly increased, the bright reds and rich purples being especially useful in the working out of colour schemes. Wallflowers have undergone considerable improvement, as also have polyanthuses and primroses, more especially with regard to the quality of their flowers and the freedom with which they are improved. Spring gardening of the present day differs materially from that which obtained favour a quarter of a century or so ago in the increased use of bulbous plants. Then the latter were confined almost exclusively to the early-flowering tulips; now these are grown in increased numbers, and, in addition, daffodils and May-flowering tulips are annually planted in enormous numbers. The improvements in certain of the spring-flowering plants, and the cheapening of daffodils and tulips has rendered it possible to produce effects more varied and beautiful in the flower garden, and to create the most charming floral displays in the pleasure grounds and plantations, as witness the great breadths of daffodils in the grass that at the present time form such glorious features of gardens on all sides. To obtain the best possible results with spring flowers it is necessary to adopt a systematic method of culture that will result in a stock of young and vigorous plants for bedding out in the autumn. In some cases rough-and-ready methods of procedure are resorted to in the preparation of stocks of plants for spring bedding, but, happily, these are few, and mostly in gardens where the pressure on the staff is great. Without exception, young plants that have made the summer's growth under favourable conditions give the best results. Therefore the stock of all the kinds should be renewed annually by means of seeds, cuttings, or division. The propagation should be commenced as early as experience has found necessary, and care taken to avoid the young plants being injured by over-crowding. When planted out to make their summer's growth they should have a partially-shaded or open position, as may be the most suitable for them, and be put a sufficient distance apart for the hoe to be freely used among them for keeping down weeds and maintaining the surface soil in a loose state. The owners of town gardens of moderate dimensions may not, for various reasons, be able to employ such plants as aubrietias, forget-me-nots, arabis, alyssums, and wallflowers very largely, but they can have a most beautiful display of flowers with the aid of a careful selection of inexpensive early and May-flowering tulips, daffodils, crocuses, and a few other bulbs. Fortunately for the town dweller, there are many varieties of each of the kinds mentioned now so cheap that they can be annually renewed at a comparatively small cost, a point of no small importance having regard to the rapidity with which bulbous plants deteriorate when grown under the conditions that obtain in town gardens of small size.

MR. OWEN THOMAS, V.M.H.

Mr. Owen Thomas, who for many years was head gardener to Queen Victoria, at Windsor, is a well-known figure in the horticultural world, and, though he has not now the control of a large garden, he continues to take the keenest interest in horticultural matters. As his name implies, Mr. Owen Thomas is a Welshman. Before taking charge of the gardens at Frogmore and Windsor, Mr. Thomas was head gardener to the Duke of Devonshire at the famous Chatsworth gardens, and previously was at Impney Hall, Droitwich. He has raised numerous excellent melons, tomatoes, etc., that still occupy a large measure of popularity, and he has done a very great deal to advance the culture of hardy fruits and vegetables. Mr. Thomas has associated himself intimately with the work of the Gardeners' Royal Benevolent Institution, and has served on the committee of that body for many years. Mr. Thomas is also a member of the Royal Horticultural Society's Fruit and Vegetable Committee, and he is taking an active part in the establishment of the new National Vegetable Society, of which he is the vice-chairman. After such a long and varied experience it is small wonder that Mr. Thomas is in great request as a judge, and is frequently called upon to advise in regard to the formation and improvement of gardens.

The Late Baron Schroder. Instead of sending to Baron Schröder's funeral a wreath of flowers, which would be faded in a day, the Secretary of the Royal Horticultural Society will advise the council to establish a pensionership of £20 a year for five years, under the regulations of the Gardeners' Royal Benevolent Institution, "In memory of Baron Schröder."

Royal Botanic Society.—At a meeting of Fellows of this Society, held on the 23rd inst., Mr. Pembroke Stephens, K.C., presiding, 62 new Fellows were elected, and 72 candidates nominated. In the course of the proceedings the Chairman directed attention to the fact that more than 250 new Fellows had recently joined the Society. All the evidences showed that the society was reviving, and was in a fair way to become very prosperous and highly popular. In June, 1909, their total liabilities were £36,677, whereas they were now £25,384. That very remarkable reduction was brought about by quiet working and belief in the society by its Fellows, many of whom had responded to the urgent appeal put before them by the council at a time of stress. The reduction in the debenture debt was between £6,000 and £7,000. Mr. J. S. Rubinstein congratulated the society on its improved outlook. At the meeting of the council which followed the general meeting, it was resolved "That Mr. Raleigh be requested to give effect to the resolution of the council passed on February 26 authorising the engagement, experimentally, of a band to play in the Gardens on the last two Sundays in May, and on four Sundays in June, between the hours of 3 and 6 o'clock."

The Spring Flowers at Belvoir Castle will be at their best during the first two weeks of May. The Duchess Garden is open to the public daily, except on Sundays. The interior of the castle is only open on Mondays, Thursdays, and Saturdays, but all the woodland walks and wild gardens are open to the public every day. Our readers will remember that we referred to and illustrated some of the spring flowers at Belvoir Castle in our issue of April 16.

Vandalism at Camberwell. A high authority on trees writes: "After a visit to Camberwell Grove and Grove Park I am not surprised that you have written regarding the treatment of the trees in these thoroughfares. The wholesale removal of branches by a 'rule of thumb' method is bad enough, but when we associate this with the slovenly manner in which the operation has been carried out, your denunciation of the whole work must be supported. It is not yet too late to have the points where amputation took place made smooth with a sharp knife or spokeshave, and painted over to prevent the ingress of damp. I agree with you that some special supervision should be exercised to prevent the wholesale disfigurement of so many of our London trees."

Jubilee Bulb Show at Haarlem. This exhibition has been visited (from March 23 to April 17) by 82,418 visitors, and the financial results are so good that not only the costs of the show are already nearly paid, but a surplus may be expected. This result is a very pleasant one, as the promoters have practically no subsidy from the State or any public corporations, but only a guarantee fund. The Queen Mother of the Netherlands paid a visit to the show on April 15, on the first day of the second temporary show, and this display quite surpassed the first special show. Queen Wilhelmina and Prince Henry of the Netherlands have announced their official visit for May 26, and consequently the fourth temporary show will be held from May 26 to 29, instead of May 20-22. The third temporary show (May 4-12) will be devoted chiefly to orchids, and is to be held under the auspices of the Netherland Amateurs' Orchid Club.

The World before the Flowers.—To-day (Saturday, April 30), Dr. D. H. Scott, F.R.S., will give the first of a series of three lectures at the Royal Institution on "The World of Plants before the Appearance of Flowers."

Trials of Perpetual Carnations.—The Perpetual Flowering Carnation Society has decided to continue the trials instituted last year at the Royal Botanic Gardens, Regent's Park, in order to further test the suitability or otherwise of perpetual carnations for the open garden. Growers desirous of assisting should send well-established plants in "sixties," having strong growths, carriage paid, to Mr. E. F. Hawes, Royal Botanic Society, N.W., during the first week in May.

Northern Auricula Show. Mr. J. W. Bentley, of Stakehill, Castleton, writes us that the Northern Auricula Show will be held in the Coal Exchange, Manchester, to-day, Saturday, April 30, from 1.30 to 5.30 p.m.

Penang Botanic Gardens. It is not without considerable regret that we learn that these gardens, which, under the curatorship of Mr. C. Curtis and more recently of Mr. Fox, have acquired much fame, have been abolished, and the site placed in the possession of the municipal authorities for conversion into a reservoir. According to an interesting note in "The Field," these gardens are the third established since the settlement of Penang in 1786, and the history of botanical enterprise in the locality comprises some interesting associations and facts. Thus, the first gardens were established by the Honourable East India Company soon after the settlement, with a view to breaking down the Dutch monopoly of the spice cultivation and trade. Considerable success attended this enterprise, but following upon the appointment of a governor who is said to have been somewhat extravagant, spending large sums on useless fortifications, they were sold at twelve days' notice by auction for a sum considerably less than their cost. The subsequent apathy of the Government led to the collapse of nutmeg cultivation, which had become the most important industry in Penang and Singapore. The second gardens were founded by Sir Stamford Raffles, but they, too, fell a victim to the caprice of a governor, who is said to have sold them "because his wife could not get enough vegetables from them to diminish the cost of her cook's bills." The third gardens were started as lately as 1884. Being placed, however, under very efficient management they quickly became a centre of attraction, and have proved of great benefit to the community in their fostering of the rubber industry, and in other ways.

The Study of Genetics. We learn that a proposal is on foot to produce a "Journal of Genetics," for the publication of articles dealing with original research in the various branches of genetics, as well as reviews and summaries of work published elsewhere. The editors are to be Professor W. Bateson, F.R.S., and Professor R. C. Punnett, and the publishers the Cambridge University Press.

Protection of Beautiful Scenery.—We are pleased to learn that the French Society for the Protection of Scenery has been successful in its endeavour to make it illegal to disfigure ancient monuments or picturesque sites with posters or other advertisements. Early in 1909 the society prepared a Bill which had for its object the prevention of the disfigurement of sites containing monuments or buildings of historic importance, or remarkable for their beauty, and succeeded in obtaining its introduction into the Chamber of Deputies. Here it obtained ready acceptance, and it was in due course passed on to the Senate, by whom it has been ratified. Under this Act the display of bills on monuments and on all natural objects and sites that have been scheduled in accordance with the Acts of 1887 and 1906 is prohibited. A breach of this law renders the offender liable to a fine of from £1 to £40. We congratulate the society on the successful results of its endeavour to prevent the disfigurement of the more interesting and beautiful parts of France, and trust the provisions of the Act will be put into operation whenever occasion demands.

Hybrid Timber Trees.—At a recent meeting of the Linnean Society Dr. A. Henry stated that certain elm seedlings had shown Mendelian results. There are but two species of elm in Britain—Ulmus montana, With., and U. glabra, Mill.; both are known in the East of England as "Wych Elm." There are, in addition, many so-called varieties, the most remarkable being the "English elm" of British botanists and foresters, confined to the South of England, and styled U. campestris; this tree is unknown on the Continent. The "Huntingdon elm" he regarded as a hybrid, the first cross between the two species cited. The previous year had been noteworthy for the profuse fruiting of every kind of elm in England, due to the fine autumn of 1908 and the abnormal amount of sunshine during the spring of 1909. We gather, from "Nature," that Dr. Henry had procured abundance of seeds of numerous varieties and forms, and from many localities. These had been sown, and their progeny analysed. It was shown that the plants thus arising conformed very closely to the Mendelian formula of 9:3:3:1. He gave, in confirmation of his views, the experience he had with regard to the black Italian poplar, Populus nigra x deltoidea, the cricket-bat willow, Salix alba x fragilis; and the Lucombe oak, Quercus Cerris x Suber; namely, that the offspring of a first cross invariably produced a crop of the most diverse character, and this induced the author to formulate his view, that when botanists were unable to agree about the forms of a given plant, it was due to a mixture of at least two species; but where there was practical unanimity, as with varieties of beech and ash, there was only one species concerned, and the varieties were due to individual peculiarities. He finally insisted upon the importance of planting trees of a first cross, on account of their abnormal luxuriance and rapid growth, and their producing timber far more quickly than either parent.

NOTES FROM KEW.

Pentapterygium serpens.

This vacciniaceous plant has, when in flower, formed an annual feature at Kew for some time, yet despite its beauty and distinct character it is very seldom met with in private gardens. Just now both in the greenhouse and Temperate House it is very beautiful. This pantapterygium forms a peculiar flattened woody rootstock of large size. From this the long gracefully arching shoots are pushed up to a height of four feet to five feet if grown as an isolated bush, and far more if trained to a support. The leaves are small, lanceolate, and, in common with many of the same order, thick in texture, and evergreen in character. The flowers, borne freely from the undersides of the shoots, are upwards of an inch long, and scarlet in colour. They are of a tubular or elongated urn shape. In its Himalayan home this shrub occurs naturally as an epiphyte, and, in common with some of the rhododendrons from the same region, which grow under similar conditions, it needs a free open soil, such as an admixture of fibrous peat and sand. Dense masses of heavy soil are very detrimental to its welfare.

Azalea amœna alba.

This delightful little azalea is a pure white counterpart of the popular A. amœna, and, like it, is so exceedingly free blooming that the small plants in the greenhouse are a mass of bloom. It is, I should say, destined to become largely grown, as these small-flowered azaleas are admired by many. In confirmation of this one has but to consider the immense numbers of the variety Hexe which are, during the season, disposed of as dwarf plants in comparatively small pots, and the value even before Christmas of the little red Azalea obtusa and its white-flowered variety. It may be noted that the correct botanical name of Azalea amœna alba is Rhododendron indicum amœnum album.

Eranthemum elegans.

One can seldom pay a visit to that portion of the T range in which an intermediate temperature is maintained without noting some particularly attractive or uncommon member of the order Acanthaceæ. This is a slender-growing species, whose flowers are borne, as in most of the others, in terminal heads, and are yellow, shading to deep orange towards the centre. In its colouring it is certainly very distinct from those generally grown.

Gloriosa Rothschildiana.

It is now half-a-dozen years since this gloriosa was first exhibited at the Temple Show, and a First Class Certificate was awarded it. Few, if indeed any other plant, attracted as much attention as did this gloriosa, the bright ruby-red of its blossoms, lit up when they were first expanded with a little yellow at the base of the segments, being so distinct from any previously seen. This flowered with the Hon. Walter Rothschild from tubers collected in Uganda. From the peculiar form of the tubers the gloriosas do not readily lend themselves to pot culture, but are seen at their best when planted out in a warm house. A splendid example of this is to be seen in the nepenthes house, where, planted in some good soil, and trained to the roof, a fine specimen is bearing a large number of its gorgeously coloured reflexed blossoms.

Helichrysum (Aphelexis) humile.

Time was when, under the name of Aphelexis humile, this helichrysum was popular in gardens. This was when specimen hard-wooded or New Holland plants, as they were generally termed, used to figure largely at the principal exhibitions. For this they were, of course, tied out in a more or less formal manner. In the Greenhouse a row of this aphelexis forms a very pleasing feature, the small bushes being allowed to assume their natural half-spreading character, and, being plentifully sprinkled with flowers, are very attractive.

Lysichitum camtschatcense.

My first acquaintance with this striking and distinct aroid was through an illustration in the Gardeners' Magazine, two or three years ago. It is just now one of the most conspicuous features in the Himalayan portion of the Temperate House, where, though no fire heat is used, it receives the protection of the structure. Planted out on the edge of a small pool it is evidently just at home. It is totally deciduous, and in spring the leaves and flowers make their appearance simultaneously. These last, however, develop the more rapidly, so that when in bloom the leaves do not play a very important part. The flowers rise to a height of a foot to eighteen inches, of which the spathe occupies six to seven inches. It is when first expanded of a bright golden-yellow, in which stage it remains for some time, but, in common with several of its relatives, the spathes ultimately become green. It is very free flowering, quite a number of spathes being now developed. By no means alone among aroids, the flowers of this lysichitum have when mature a decidedly unpleasant odour. After the flowering season is past it is well worthy of consideration for its handsome foliage. The leaves when full grown are a couple of feet or nearly so in length, and eight to nine inches wide. They are deep green, marbled with a lighter hue. This lysichitum occurs in a native state in swampy districts in North-eastern Asia and North-west America. It is quite hardy, but is seen at its best with a little protection.

Hybrid Rhododendrons.

Of late years the Himalayan Rhododendron Griffithianum or Aucklandi, as it is more generally termed, has been extensively employed by the hybridist, a great stimulus, no doubt, being the great popularity of the variety Pink Pearl. Two very pleasing hybrids are now in bloom in the Temperate House, one, a cross between R. Griffithianum and the well-known garden variety Grand Arab, having fine clusters of beautiful pink blossoms; while in the second, in which Ascot Brilliant took the place of Grand Arab, the flowers are more of a carmine tint. The form of the flowers and their arrangement show markedly the influence of R. Griffithianum.

K.

THE LATE BARON SIR HENRY SCHRÖDER, BART., V.M.H.

On April 20, at Sidmouth, Baron Sir John Henry William Schröder, K.C.V.O., V.M.H., passed away in his eighty-sixth year. Although not entirely unexpected, the death of "The Baron," as he was familiarly spoken of, will be very widely regretted throughout the horticultural world. As head of the firm of Messrs. J. H. Schröder and Co., of Leadenhall Street, he was a man of considerable wealth, and it was ever his delight to surround himself at his beautiful home at The Dell, Egham, with the finest products of horticultural skill and enterprise. He had a boundless love for plants and flowers, and was one of the most generous patrons of horticulture during the last thirty years. At The Dell he formed a large collection of superb orchids, a collection that contains large numbers of wonderful, beautiful, and unique specimens, for many of which he paid very high prices. Not only have the glass houses at The Dell been filled with choice and rare plants, but the garden and grounds have been beautified by the finest flowering trees and shrubs, planted in large groups and beds. Probably at no other private garden is there such a wealth of choice varieties of hardy rhododendrons as at The Dell. In 1882 Baron Schröder gave a donation of £1,347 15s. to the Gardeners' Royal Benevolent Institution; he was a vice-president of the institution down to the time of his death, and in 1893 he presided at the annual festival dinner. He was also a life subscriber to the Royal Gardeners' Orphan Fund, and contributed liberally to this excellent charity. But although Baron Schröder will long be kept in grateful memory for his fine plant collections, and his generous assistance to gardening charities, he will probably be best remembered for his staunch advocacy of "The Hall Scheme," projected by the Royal Horticultural Society, a scheme that materialised in the splendid building and offices in Vincent Square. For many years Baron Schröder was a vice-president of the Royal Horticultural Society, and it was his great desire to see the society possess an exhibition hall, library, and offices worthy of the art and science it fostered. He was chairman of the New Hall Committee, and used his great influence wisely and well for the advancement of the scheme, even going so far as to secure the site of the present hall as soon as it was considered to be a suitable one. Baron Schroder issued a strong appeal for the support of the movement, and he also backed up his appeal by a donation of £5,000 towards the £40,000 required. Happily, after the initial difficulties were overcome, the scheme prospered, the hall was built, and Baron Schröder was present on Friday, July 22, 1904, when His Majesty the King, accompanied by the Queen and Princess Victoria, opened the new buildings. There could hardly have been a happier man than the Baron on that occasion. To his previous munificent gift Baron Schröder added yet another for, desirous of seeing the Lindley Library, and the works accumulated by the society, suitably housed, he, at his own expense provided all the beautiful fittings and furniture that make the Library at Vincent Square one of the finest rooms of a similar kind in all London. The brass tablet over the library door will serve to remind Fellows of Baron Schröder's generosity, the fine portrait in the Council Chamber will tell for years to come what manner of man he was, but the great hall itself is a monument to his foresight, determination, business ability, and great generosity.

Allamandas.—Of the great beauty of these plants, with their large golden flowers, there is no occasion to speak, and it will suffice to say that they are not difficult to cultivate either in pots or in borders, provided a stove temperature can be given them. A. Hendersoni still remains the finest of the large-flowered forms.—S.

EXETER DAFFODIL AND SPRING FLOWER SHOW.

The Devon and Exeter Horticultural Society held its spring show in the Victoria Hall, Exeter, on Friday, April 22. The hall is a spacious building well adapted to the purpose of holding an exhibition of this nature, and the secretary and committee are to be congratulated upon the admirable arrangement of the display. There was a capital entry, some really fine flowers being staged in the principal classes.

The largest class was for twenty-four varieties of daffodils, fairly representing the three groups, Magni coronati, Medio coronati, and Parvi coronati, not less than three varieties in either group, one vase only of one variety, containing three blooms. The best exhibit in this class was that staged by Mr. A. Buchanan, gardener to Mrs. Gage-Hodge, his blooms of King Alfred, Gloria Mundi, Weardale Perfection, P. R. Barr, Lucifer, Gleam, and others being very fine. Unfortunately, two vases of Albatross were staged, and on this account the exhibit was disqualified. First prize was consequently awarded to Mr. W. Rowland, gardener to W. Brock, Esq., who had good varieties, and well-grown blooms, some of which, however, showed age. The exhibit comprised Bridesmaid, Beatrice Hesseltine, Baroness Heath, Maximus, Mdme. de Graaff, Victoria, Constellation, P. R. Barr, White Lady, Glory of Leiden, Poetarum, Beauty, Seagull, Emperor, Mdme. Plemp, Gloria Mundi, Weardale Perfection, Ariadne, Princess Mary, Barri conspicuus, Firebrand, King Alfred, Mrs. Walter Ware, and Duchess of Westminster. Second place was secured by Mr. J. Mitchell, gardener to Rev. T. Buncombe; Mr. J. W. Hussey, third, Mr. Gould, gardener to H. H. Dippell, Esq., fourth.

In a similar class for twelve varieties, Mr. Cobbin, gardener to Mrs. Bolitho, led, while Mr. T. Littlejohn, gardener to Rev. Heathcote, took second with some fine blooms. We thought, in fact, that this was the superior exhibit. Mr. H. Hooper, gardener to T. Knapman, Esq., was third. Mr. J. Mitchell secured premier honours for six vases of Magni coronati varieties with Mrs. Camm, Grandee, Mdme. de Graaff, Goldfinch, Weardale Perfection, and Emperor; Mr. A. Buchanan, second, his vase of King Alfred being very fine; Mr. Baker third. Mr. Buchanan and Mr. Mitchell were placed in the order named for six Medio coronati varieties, and for six Parvi coronati Mr. J. Copp, an amateur, scored with good blooms of Blood Orange, Vivid, Almira, Glory, Beacon, and Bullfinch; Mr. Buchanan and Mr. Mitchell followed.

BULBOUS PLANTS IN POTS.

For twelve pots of trumpet daffodils, three bulbs in each, Mr. W. J. Cobbin was awarded first. He had nice examples of Victoria, Grandee, P. R. Barr, and other serviceable varieties. Mr. W. Rowland came second, his best being Weardale Perfection, Walter Ware, Glory of Leiden, and Mdme. de Graaff. In the class for six pots of the same class, a lady exhibitor, Miss F. Saunders, was the only competitor. For six pots narcissi, excluding polyanthus varieties, Mr. Cobbin and Mr. A. Olding received first and second prizes respectively. Mr. H. Baker won first for six pots of polyanthus narcissi; Mr. F. Webber, gardener to Mrs. W. J. Pring, second. Mr. A. Olding, gardener to A. F. Shapland, Esq., was awarded first for six pots of freesias, which were well-grown stuff. Mr. W. Rowland, gardener to W. Brock, Esq., had the best lily of the valley, Mr. Cobbin being second.

For six pots single tulips, Mr. Gould was the only exhibitor, the first prize being awarded him, as also in the classes for doubles, and for three pots. In two classes Mr. Rowland received second prize

MISCELLANEOUS PLANTS.

Mr. W. Rowland was first for six flowering plants, distinct kinds; Mr. A. Olding second; Mr. F. Webber third. Only one entry for a specimen azalea was forthcoming, Mr. Rowland being the exhibitor. Mr. A. Olding brought six azaleas, which secured first in that class. The same exhibitor also scored with six cyclamen. For six primulas, Mr. S. T. Gould and Mr. Webber were awarded first and second prizes in the order named. Six spiræas: Mr. A. Olding, first; Mr. Rowland, second. Mr. H. Baker, gardener to T. Bradley Rowe, Esq., took first for three deutzias.

In the class for six plants for table decoration, Mr. S. T. Gould won with Cœlogyne cristata, Cypripedium insigne, an anthurium, deutzia, cyclamen, and Primula obconica; Mr. Webber second. For six foliage plants Mr. Gould was again first, and Mr. Webber second. Mr. C. Knibb, gardener to A. Lythall, Esq., had the best six cinerarias, Mr. A. Olding and Mr. S. T. Gould taking second and third. Mr. C. M. Collingwood, an amateur, was the only exhibitor of six stellate cinerarias, and was awarded first prize. Mr. Webber won under similar conditions for six pot roses. Mr. Knibb exhibited six pots of schizanthus, which were really remarkable examples of a fine strain skilfully grown.

Mr. W. Rowland led for three Dielytra spectabilis, his plants being large, and beautifully flowered; Mr. Olding was second.

A special class was provided by Messrs. R. Veitch and Son, The Royal Nurseries, Exeter, for twelve varieties of single daffodils. The first prize was awarded Mr. W. Rowland, Miss F. Saunders being second. Mr. Baker's exhibit was disqualified for staging three varieties, unnamed, contrary to the conditions of the class. Messrs. Sutton and Sons, Reading, offered special prizes for twelve pots of their Cineraria stellata, and the exhibits made a brave show. Mr. W. Rowland led with fine plants; Mr. S. T. Gould second; Mr. H. Baker third. Four competitors came forward in the ladies' class for a table 8ft. by 4ft., decorated with cut flowers and foliage. Miss Knapman was first, and Mrs. Burton second, both using schizanthus, Miss D. Knapman being awarded third for a bright display of zonal pelargoniums.

A class that deserves special mention, and one that should receive greater attention at spring shows, was that for six vases filled with stems or sprays of hard-wooded flowering shrubs. Mr. C. Knibb received first prize for good bunches of Prunus sinensis, Cytisus præcox, Berberis Darwini, Spiræa arguta, Kerria japonica fl.-pl., and Ribes sanguineum album. Mr. Gould came second with double cherry, rhododendron, Choisya ternata, etc.; Mr. Buchanan was third, a nice piece of Piptanthus nepalensis being noteworthy in his exhibit.

NON-COMPETITIVE EXHIBITS.

Messrs. Robert Veitch and Son, The Royal Nurseries, Exeter, contributed a large and varied display of plants and cut flowers that constituted an imposing feature of the show. The exhibit occupied the whole of one end of the hall, being arranged as a bank of flowers, intermingled with graceful foliage. Amaryllis were conspicuous with their glowing crimsons and intense scarlets, relieved by white markings in some of the flowers. Brilliant azaleas and fragrant lilacs were surrounded by copper-leaved acers, graceful bamboos, and many other fine shrubs, and equally interesting alpines. About fifty varieties of choice daffodils, some good carnations, and a vase of hybrid gerberas of exquisite shades of colour, helped to make this a particularly fine exhibit.

At the opposite end of the hall the Devon Rosery and Fruit Farm, Lim., Torquay, staged roses in pots in great variety. The majority of the plants were small, compact, healthy specimens of the more popular varieties of H.T.'s and H.P.'s., while ramblers in variety were used as a background. Unfortunately, none of the varieties were labelled. We consider it should, in the interests of visitors, be made compulsory for exhibitors to name the plants and flowers they stage.

An extensive collection of the newer and choicer daffodils came from Messrs. Barr and Sons, King Street, Covent Garden, London. This exhibit naturally attracted local enthusiasts, and was also a centre of attraction to the general visitors. Varieties for special attention were the very beautiful Seraphin, Horace, the now popular poeticus variety, Peter Barr, Lord Kitchener, and Mohican; Incognita, remarkable for its exceptionally large, flat crown, and the quite distinct and graceful Cingalee, a flower of most aristocratic appearance. A number of the smaller daffodils, such as Capax plenus, Queen of Spain, and Cernuus plenus were also included in this representative collection.

Ireland was well represented by the interesting group of daffodils sent over by the Lissadell Bulb Farm, Sligo. The range of varieties was wide, some of the best being M. J. Berkeley, Torch, Brigadier, Queen Maeve, White Queen, and Artemus. All the blooms were beautifully clean, and showed good cultivation. In the centre of the hall was a group of tall palms, azaleas, spiræas, etc., staged by Mr. George Kerswell, Bowhill Nurseries, St. Thomas, Exeter, who also showed a quantity of the richly-coloured Gentiana acaulis.

Messrs. Saunders and Biss, horticultural builders, Exeter, had on view a series of interesting photographs, depicting various styles of conservatories, plant houses, and garden frames, as constructed by the firm. A notable feature of all the structures is the adoption of the zinc dry-bar method of glazing, which is the speciality of the firm. By this method the use of putty is dispensed with, and heavy, light-obstructing rafters are unnecessary. The exhibit was of much educational interest to practical gardeners.

INTENSIVE CULTURE.

Messrs. Sutton and Sons, Reading, inform us that upon the suggestion of one of the principal residents of Birmingham, and by kind permission of the Lord Mayor and the Parks' Committee, they are hoping to make in Warley Park, Birmingham, during Whitsuntide week, an educational exhibit in the form of a model French garden, demonstrating the Continental system of intensive culture and vegetable forcing, by the aid of hotbeds, frames, and cloches.

This garden will be the first complete model ever exhibited in this country, and will cover altogether some 1,500 square feet of ground, showing the preparation of the hotbeds, the uses of the cloche for raising seeds, and also for bringing on seedlings.

The following crops, either mature or in various stages of growth, will also be exhibited in frames or under cloches: Cabbages, carrots, cauliflowers, endives, cabbage lettuce, cos lettuce, marrows, melons, peas, radishes, spinach, strawberries, tomatoes, turnips.

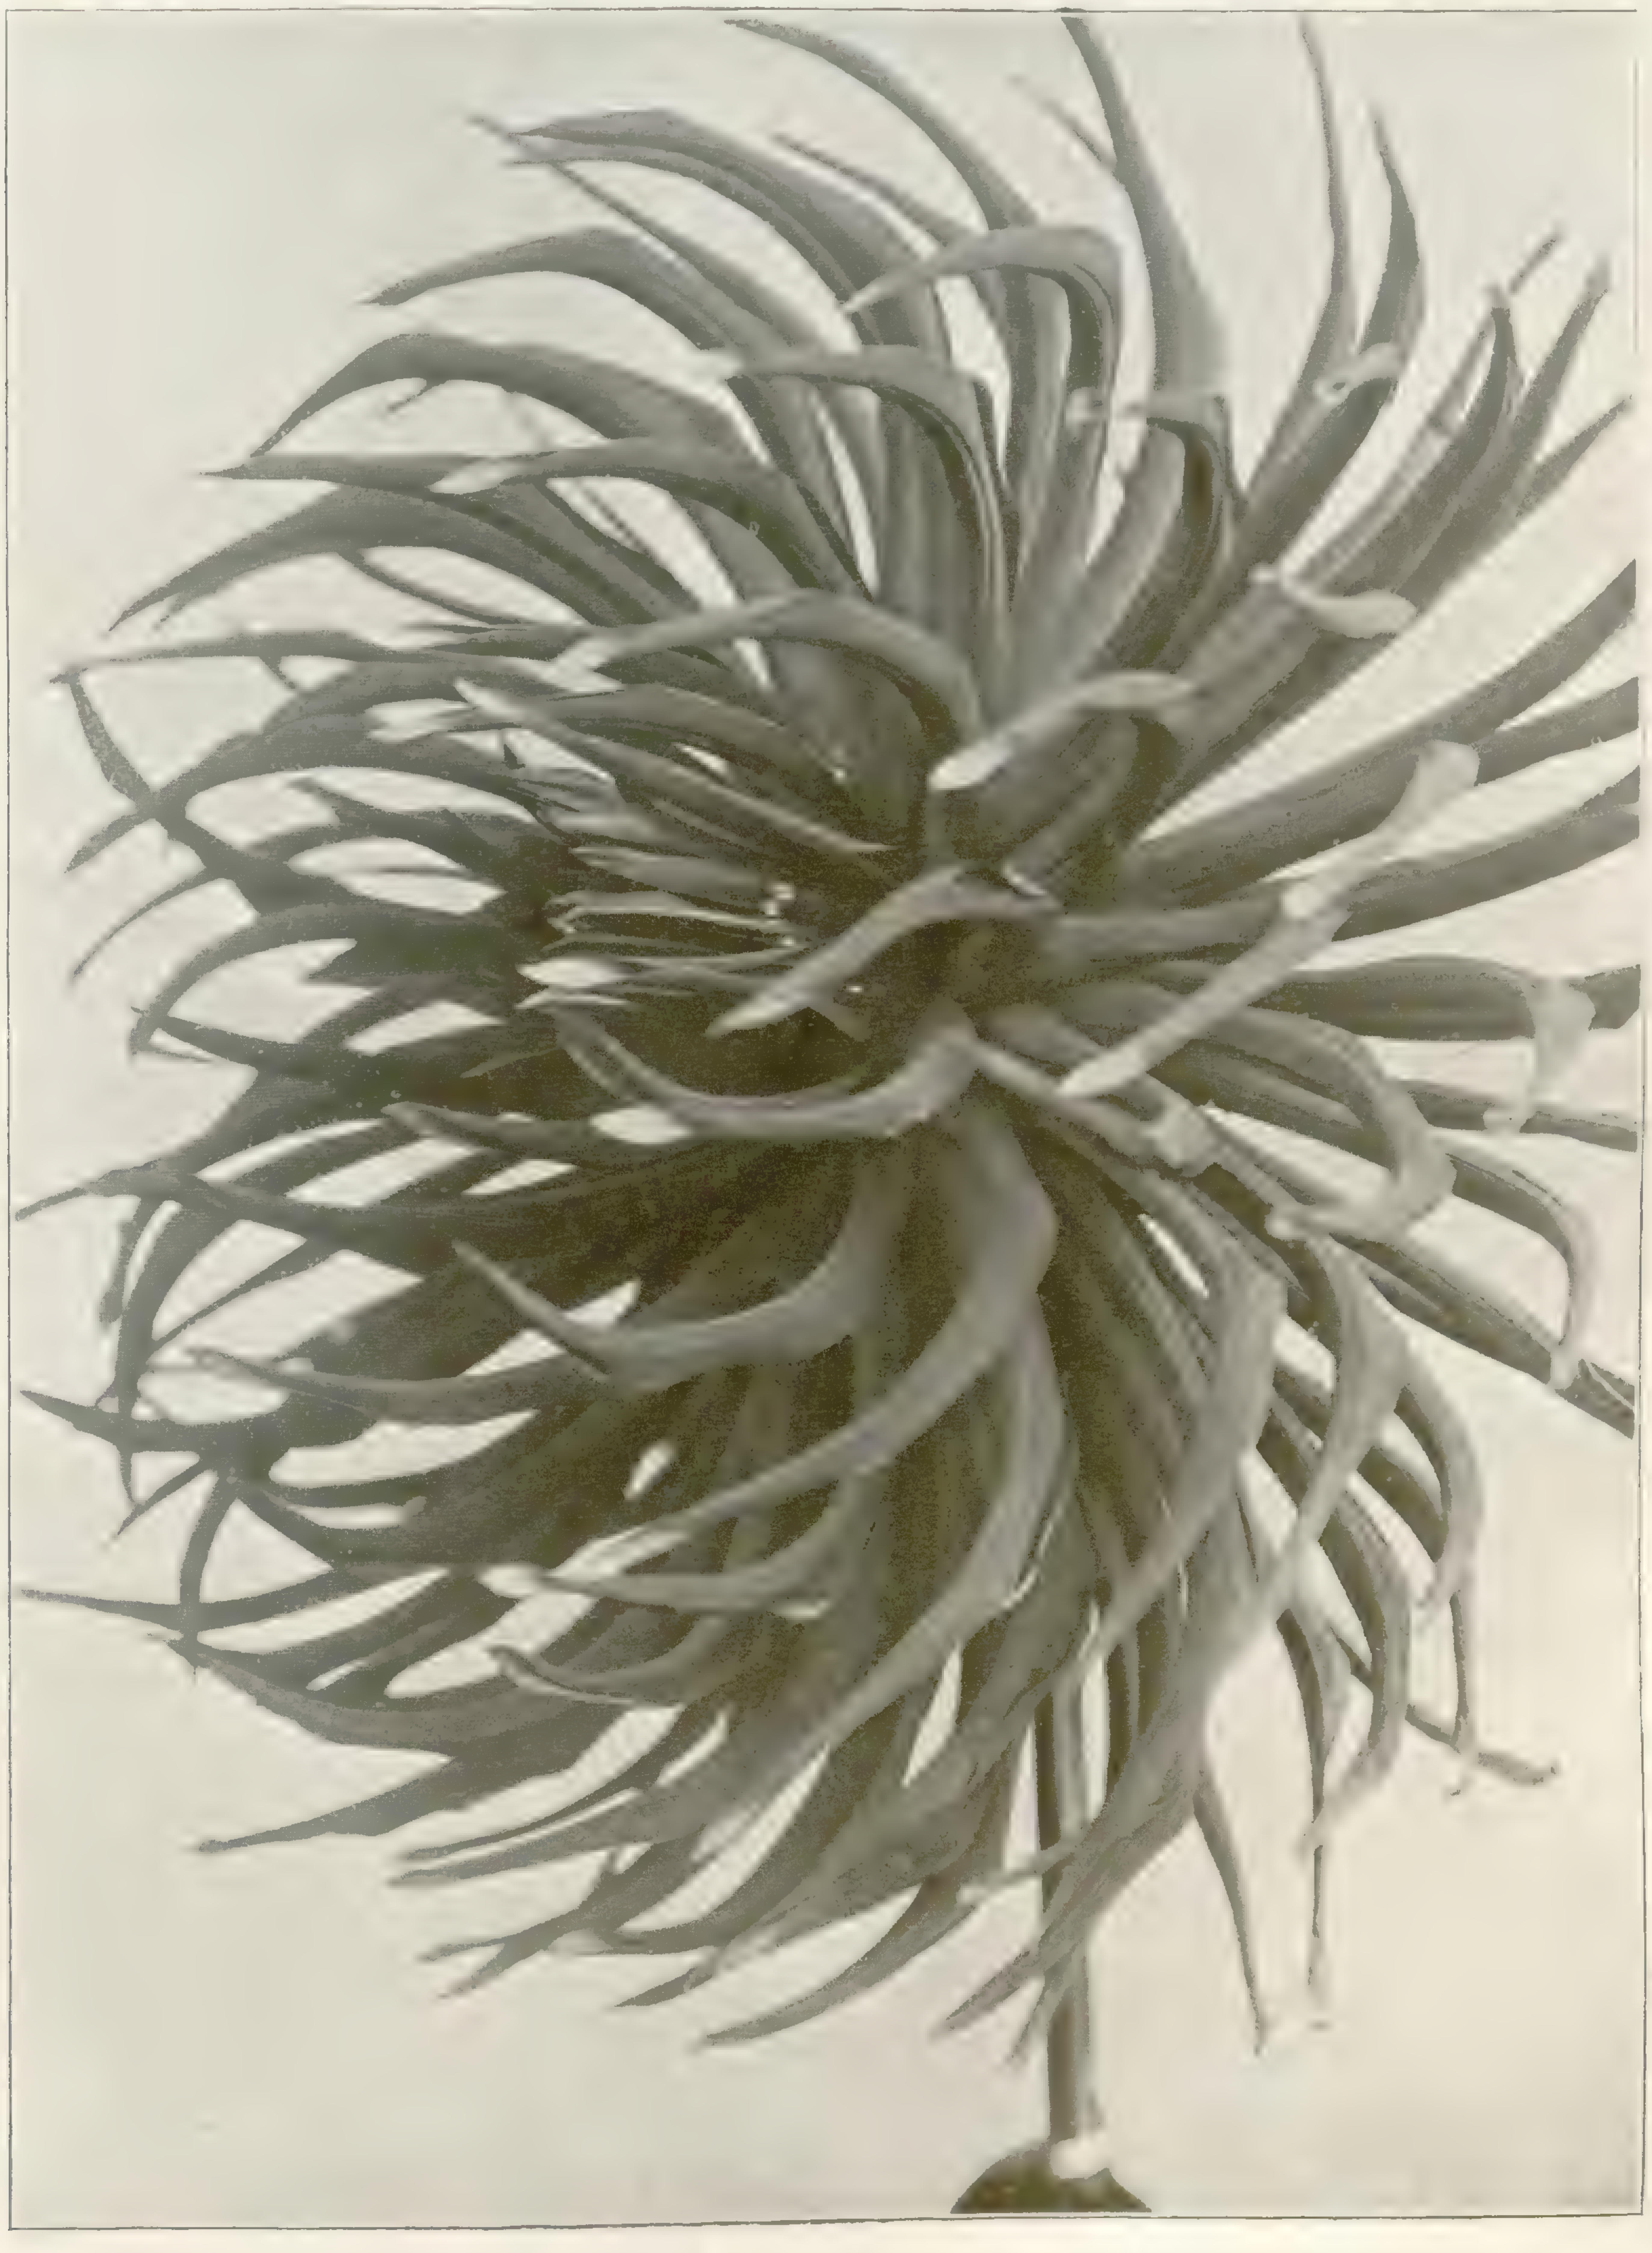
The whole of the garden has been prepared in Messrs. Sutton and Sons' experimental grounds at Reading, and will be transferred to Warley Park.

The Rt. Hon. the Lord Mayor of Birmingham has shown his interest in this unique demonstration by expressing a hope that it may be possible for him to inspect it on Whit Monday, after which it will be open to the public free of charge, and will remain on view till Friday, May 20.

Lilium testaceum is one of the most handsome and useful of the hardy lilies and under good cultivation reaches a height of four or five feet. The flowers are produced in umbels of from three to ten, are rather large, nodding, with revolute segments, colour pale buff. Vigorous in growth, easily cultivated, and flowering at the end of June. This lily is assumed to have originated as a hybrid between L. candidum and L. chalcedonicum in a garden at Erfurt, and was introduced to cultivation about the middle of the nineteenth century.—R. F.

SOME NEW CACTUS DAHLIAS

To those of our readers who take an interest in dahlias and their cultivation it is well known that Messrs. James Stredwick and Son, Silverhill Park, St. Leonards-on-Sea, have occupied a prominent position among raisers and cultivators of these flowers. It is also a matter of common knowledge that they have been especially successful in their efforts to improve the cactus dahlia, and as the result of their persistent endeavour have enriched our gardens with a large number of varieties of an especially high order of merit. The number of varieties of their raising that have received distinction from the Royal Horticultural Society, the National Dahlia Society, and other bodies is very large, and the popularity enjoyed by the most noteworthy is indicated by the free use that is made of them by growers for exhibition in making up their collections for competitive purposes.



NEW CACTUS DAHLIA RED ADMIRAL.
Raised by Messrs. J. Stredwick and Son. Colour rich crimson.

Messrs. Stredwick and Son have been careful to proceed with the work of improvement on well-defined lines, and in the selection of varieties for distribution they would appear to have constantly kept in view the importance of a marked improvement in colour or form, or, it may be, in both of these attributes.

Hence their new varieties belonging to the cactus section are each season anticipated with much interest, more especially as cultivators have had an opportunity of seeing the majority of them, if not all, at the exhibitions, or of reading something about them, as the firm year by year submit their novelties to the leading societies, who make awards to new dahlias, and invariably obtain distinction for the majority. The varieties that are being distributed from Silverhill Park this season are not less remarkable in their way than were the varieties, in their respective seasons, that have preceded them, and they are all marked advances upon the cactus varieties in the same lines of colour. Messrs. Stredwick and Son have of late turned their attention to the raising of cactus varieties adapted for the production of rich colour effects in the garden, and this year they are introducing four varieties, which should be welcome to those growing dahlias exclusively for beautifying the garden. Of the exhibition cactus varieties that are being introduced this season the following are especially deserving attention.

Red Admiral is a remarkably fine variety, with large, finely formed blooms of a rich scarlet hue. The size and form of the blooms is well shown in the accompanying illustration, and with the aid of this it is not difficult to understand that the National Dahlia Society should have awarded it a First Class Certificate, and the Royal Horticultural Society should have made an Award of Merit in its favour.

Indomitable is a valuable addition to the light-coloured exhibition varieties, and will, there is good reason to believe, become highly popular. The blooms are large and full, and the florets are long, narrow, and gracefully arranged; the colour, mauve-lilac, lighter at the tips. This has received the A.M. of the R.H.S., and the F.C.C. of N.D.S.

Jupiter is a valuable contribution to the list of fancy cactus dahlias, and will be popular among those who appreciate the distinctive colouring of the varieties belonging to the fancy section. In size and form the blooms of Jupiter have much to recommend them, and the narrow florets are yellow at the base, passing to pink, and are freely striped and splashed with bright crimson. This received the A.M. of the R.H.S.

Johannesburg is a distinct variety, the blooms very large, and of fine form, the florets long and gracefully curving, but less twisted than in the majority of the present-day varieties; the colour, rich yellow.

H. H. Thomas is a crimson variety of quite exceptional merit; the blooms, large and very full, with long, much twisted florets; while of the highest value for exhibition, this variety should prove of much merit for the garden, owing to its freedom of flowering. It received the A.M. of R.H.S., and the F.C.C. of N.D.S.

Iolanthe is especially deserving of attention for its distinct and effective shade of colour, as well as for the other good qualities it possesses, the colour is coral-red, and each floret is tipped with gold. The blooms are of the largest size, very full, elegant in contour, and freely produced. A.M., R.H.S., and F.C.C., R.H.S.

Goldcrest is remarkable for its distinct colouring and its effectiveness. The blooms are of medium size, with incurving elegant florets, of which the lower half is rich yellow, and the upper half bright scarlet. This variety is described as being "over free in flowering, and as carrying its blooms quite erect." A.M., R.H.S., and F.C.C., N.D.S.

Quimbo is valuable for its dark colour, as well as for its fine form. The blooms are of the largest size, the florets long, narrow, and gracefully incurving, and the colour crimson-maroon. A.M., R.H.S., and F.C.C., N.D.S.

In addition to the foregoing and several other fine exhibition cactus varieties. Messrs. Stredwick offer a set of four cactus varieties for garden decoration. These are Erecta, Lightship, Penguin, and The Lion. and they appear to be especially deserving of attention from the general body of cultivators.

ANNUAL ASTERS.

A few years ago the prefix "annual" would not have been necessary when speaking of the bedding, or Chinese, aster (Callistephus chinensis), but the growing popularity and ever-increasing variety of the Michaelmas daisies, which belong to the genus aster, have resulted in the ubiquitous bedding annual no longer having a name to itself. If the original introduction from China had been one of the double forms, to which we have become so accustomed that we do not realise that the true species is a single mauve flower with a yellow centre, it would never have obtained the name aster, though to the single flower it is as appropriate as to the Michaelmas daisy. It is one of the flowers that the beginner usually starts upon, and he obtains better results than he would do with most of the commonly grown flowers.

One used to be recommended to sow the seed in heat very early in the spring, so as to have them to flower early, but the end of March or early in April is now regarded as quite soon enough even in a cold house or frame, while for later crops of blossom the middle of May is not too late. After the latter part of April seed may be sown in the open ground, and the seedlings treated like other annuals sown in the open, but such good results will not be obtained as by the more careful raising of the plants under glass. The most important points in their cultivation are the thin sowing of the seed, the avoidance of anything like legginess by giving the seedlings plenty of air, and keeping them close to the glass, pricking them out into boxes of good light soil as soon as they are showing the third leaf, and keeping them in a cold frame till the danger of any check from a damaging frost is over, finally choosing genial weather, preferably a little damp, for putting them out in the open, and then only in the shade for the first day or two.

They should be planted out carefully in cool or showery weather, if possible, each plant with a ball of earth attached, good results never being obtained from plants dibbled in like cabbages, with their leaves lying flat on the ground for a day or two afterwards. A foot apart is a fair distance to allow. The China aster likes good feeding, and must have a good depth of soil if it is to come triumphantly out of a hot, dry spell in July. About the middle of July the soil between the plants, which should have been kept stirred through the previous part of the summer, should be covered with a top-dressing of rotted manure, and given a good watering if the weather is dry, when flowers of exhibition quality may be expected, especially if slight disbudding is done, so that not more than four or five blooms are on one plant. Watch must be kept for the black fly, as this often attacks them, even while they are still in boxes. A syringing with the old remedy—soft soap and quassia—generally wanted for the roses before May is out—will easily clear it off in the early stages, before the leaves begin to curl, but otherwise the plants may be ruined. Earwigs often deform the blooms very much, and when any trouble is experienced, or threatened, with them, small flower pots filled with moss, or rubbish of some sort, should be hidden among the plants, and occasionally inspected.

The aster is especially suitable for growing in masses, either in specially prepared beds on the lawn, or in patches in the borders. They often suffer most from the storms of the late summer, just when the flowers are in their full beauty, and it is advisable to choose positions for them where they will be protected a little from the winds between south-west and north-west. It is worth while to put a short stick to each one to support the main stem, but not long enough to be visible, and then, if they are well grown, they will not sustain much damage from any ordinary bad weather. Some complain of the aster that it is too formal, but that objection is not so valid as it used to be now that we have flowers of the Ostrich Plume type, with their feathery heads and graceful habit of growth. This and the Comet type are certainly two of the finest forms to grow for general bedding purposes. This complaint of formality is owing, in large measure, to the very dwarf forms of the aster, which, though suffering less damage from storms in the late summer, are more suitable for pots than beds. Whatever may be said against it, the fact remains that for the production of colour effect there are few things which surpass it.

A great value of the aster lies in its use as a reserve bedder, and its adaptability in the matter of bedding out, for it is possible, with care, and by choosing the right weather, to bed out asters or pot them up at almost any stage of their growth. If we have beds which keep in flower so late in the spring that it becomes early summer—and some spring beds, e.g., daisies, have a provoking way of doing this in cool seasons—then, without resorting to the later raising of the plants in anticipation, we may plant them out on a nursery bed to be growing on, and put them in their final summer positions at the end of June, or later if necessary. This is especially useful after a bed of autumn-planted violas, which will make a fine display throughout May and June in a normal season, but are not good enough to have through the whole summer.

As mentioned above, some of the asters are useful for pots, and for this purpose they may be taken up and potted when coming into flower if damp weather is chosen for the purpose, or, failing that, if the ground is well soaked a few hours beforehand. For cutting the aster is invaluable, almost fulfilling the purpose of the chrysanthemums, which, indeed, some very much resemble, and they last as long a time in water. Single forms have been coming into notice lately, and among them the original Callistephus chinensis, as it is often called. Some are coarse, while others are scarcely surpassed by the most beautiful single chrysanthemums, for which they may be mistaken by many when cut.

Alger Petts.

Hoeing and Weeding.—May is a delightful month, but it provides sufficient work to keep the most energetic of cultivators fully employed; weeds will be growing apace, and to wage war against them before they have reached the flowering stage is a point of good practice, more especially as the hoe, in cutting the weeds, loosens the surface soil and facilitates the passage of warm rains and air to the roots of crops. —W.

Apple, Pear, and Plum Blossom.—Last year, being cold, wet, and lacking in sunshine, many fruit-growers feared a bad show of blossom this year, owing to the unripe condition of the buds in many parts of the country. I do not know how the apple, pear, and plum blossom is showing in other parts of the country, but in the southern portion of Hampshire the trees are grandly clothed, and if we fortunately escape frosts, good average crops may be reasonably expected.—G. SPRING-FLOWERING ANEMONES.

The dwarf-growing species and varieties of anemone are not rock plants in the strictest sense, as the majority of them are found in Nature among upland pastures and in sunny woodland glades, and only a comparatively few climb to high elevations. Nevertheless, under cultivation they form a group of most beautiful and useful subjects for furnishing rock gardens and similar positions. Those partaking of the character of true alpines are A. alpina, A. sulphurea, A. pulsatilla, and A. vernalis. All these have a big tap-root, which renders them difficult to transplant; on the other hand, when raised from seed, and early established in the open, few plants surpass these in vigour and longevity.

While seed offers the surest and safest means of establishing these alpine species, it is also the most interesting, as with the pleasure taken in recording their progress comes the satisfaction in watching them flower. As an instance, let me note how varied are the progeny of Anemone pulsatilla alba from seed; forms with green, sulphur, and dull white petals are innumerable, but an albino form, with the petals snow-white, is none too frequent, and such, when it is produced from seed, equals the type in vigour, and in itself is one of the loveliest of hardy plants.

Anemone alpina is generally found upon limestone soils, and A. sulphurea on granitic formations, the latter being generally regarded as a geographical form of A. alpina. Both species succeed in light, rich soil, in moist, well-drained positions, either on the rock garden or the drier parts of the bog. In flower A. alpina is somewhat variable, the petals, white or cream tinted, having a purple tinge on the reverse. A. sulphurea has soft yellow flowers. In A. pulsatilla the buds are densely coated with fine silky hairs, and the mature flowers are violet, carried upon nine-inch stems; it is exceedingly free in flowering, and a plant of sterling merit on limestone soils. A. vernalis is a dwarf species, the buds also being clothed with silky hairs, and the goblet-shaped flowers are pearly-white, the reverse of the petals being violet. It succeeds best in peat and loam in positions always moist, and yet exposed to the sun.

Passing over the section of which Anemone hepatica is the type, we have a group of almost equal beauty, yet infinitely more accommodating as garden plants. They are indigenous to Southern Europe, and are characterised by having a tuberous root-stock; all are easy to establish, increase rapidly, and form masses that eventually cover large areas. Soil is of minor importance to these South Europeans, as they flourish in ordinary garden soils, but position is of great importance, as they must have sunshine, otherwise leaf growth is developed at the expense of flowers. Anemona blanda is considered to be the Greek form of A. apennina, and is one of our most precious spring flowers, often breaking into bloom early in February. The flowers are large, and variable in colour, but generally some shade of blue, and occasionally white. Anemone apennina is taller than A. blanda, and produces deep blue flowers over elegantly cut foliage some six weeks later. Anemone hortensis fulgens is a brilliant scarlet flower indispensable in the late spring; there is also a fine form named alborocusis, in which the scarlet is most intense. The various forms of A. nemerosa, our native species, fall naturally into this group. The type is most at home in damp bottoms in woodlands, but its double form is a most excellent garden plant. Of the coloured forms A. Robinsoniana is quite one of the loveliest of hardy plants, although it is somewhat slow of increase; the colour is a fine shade of lavender-blue. Blue Bonnet is a late-flowering form, with larger flowers than the type. This section also includes A. coronaria, a species represented by innumerable garden forms, a variety of outstanding merit being King of Scarlets, which is a flower of faultless beauty and brilliance.

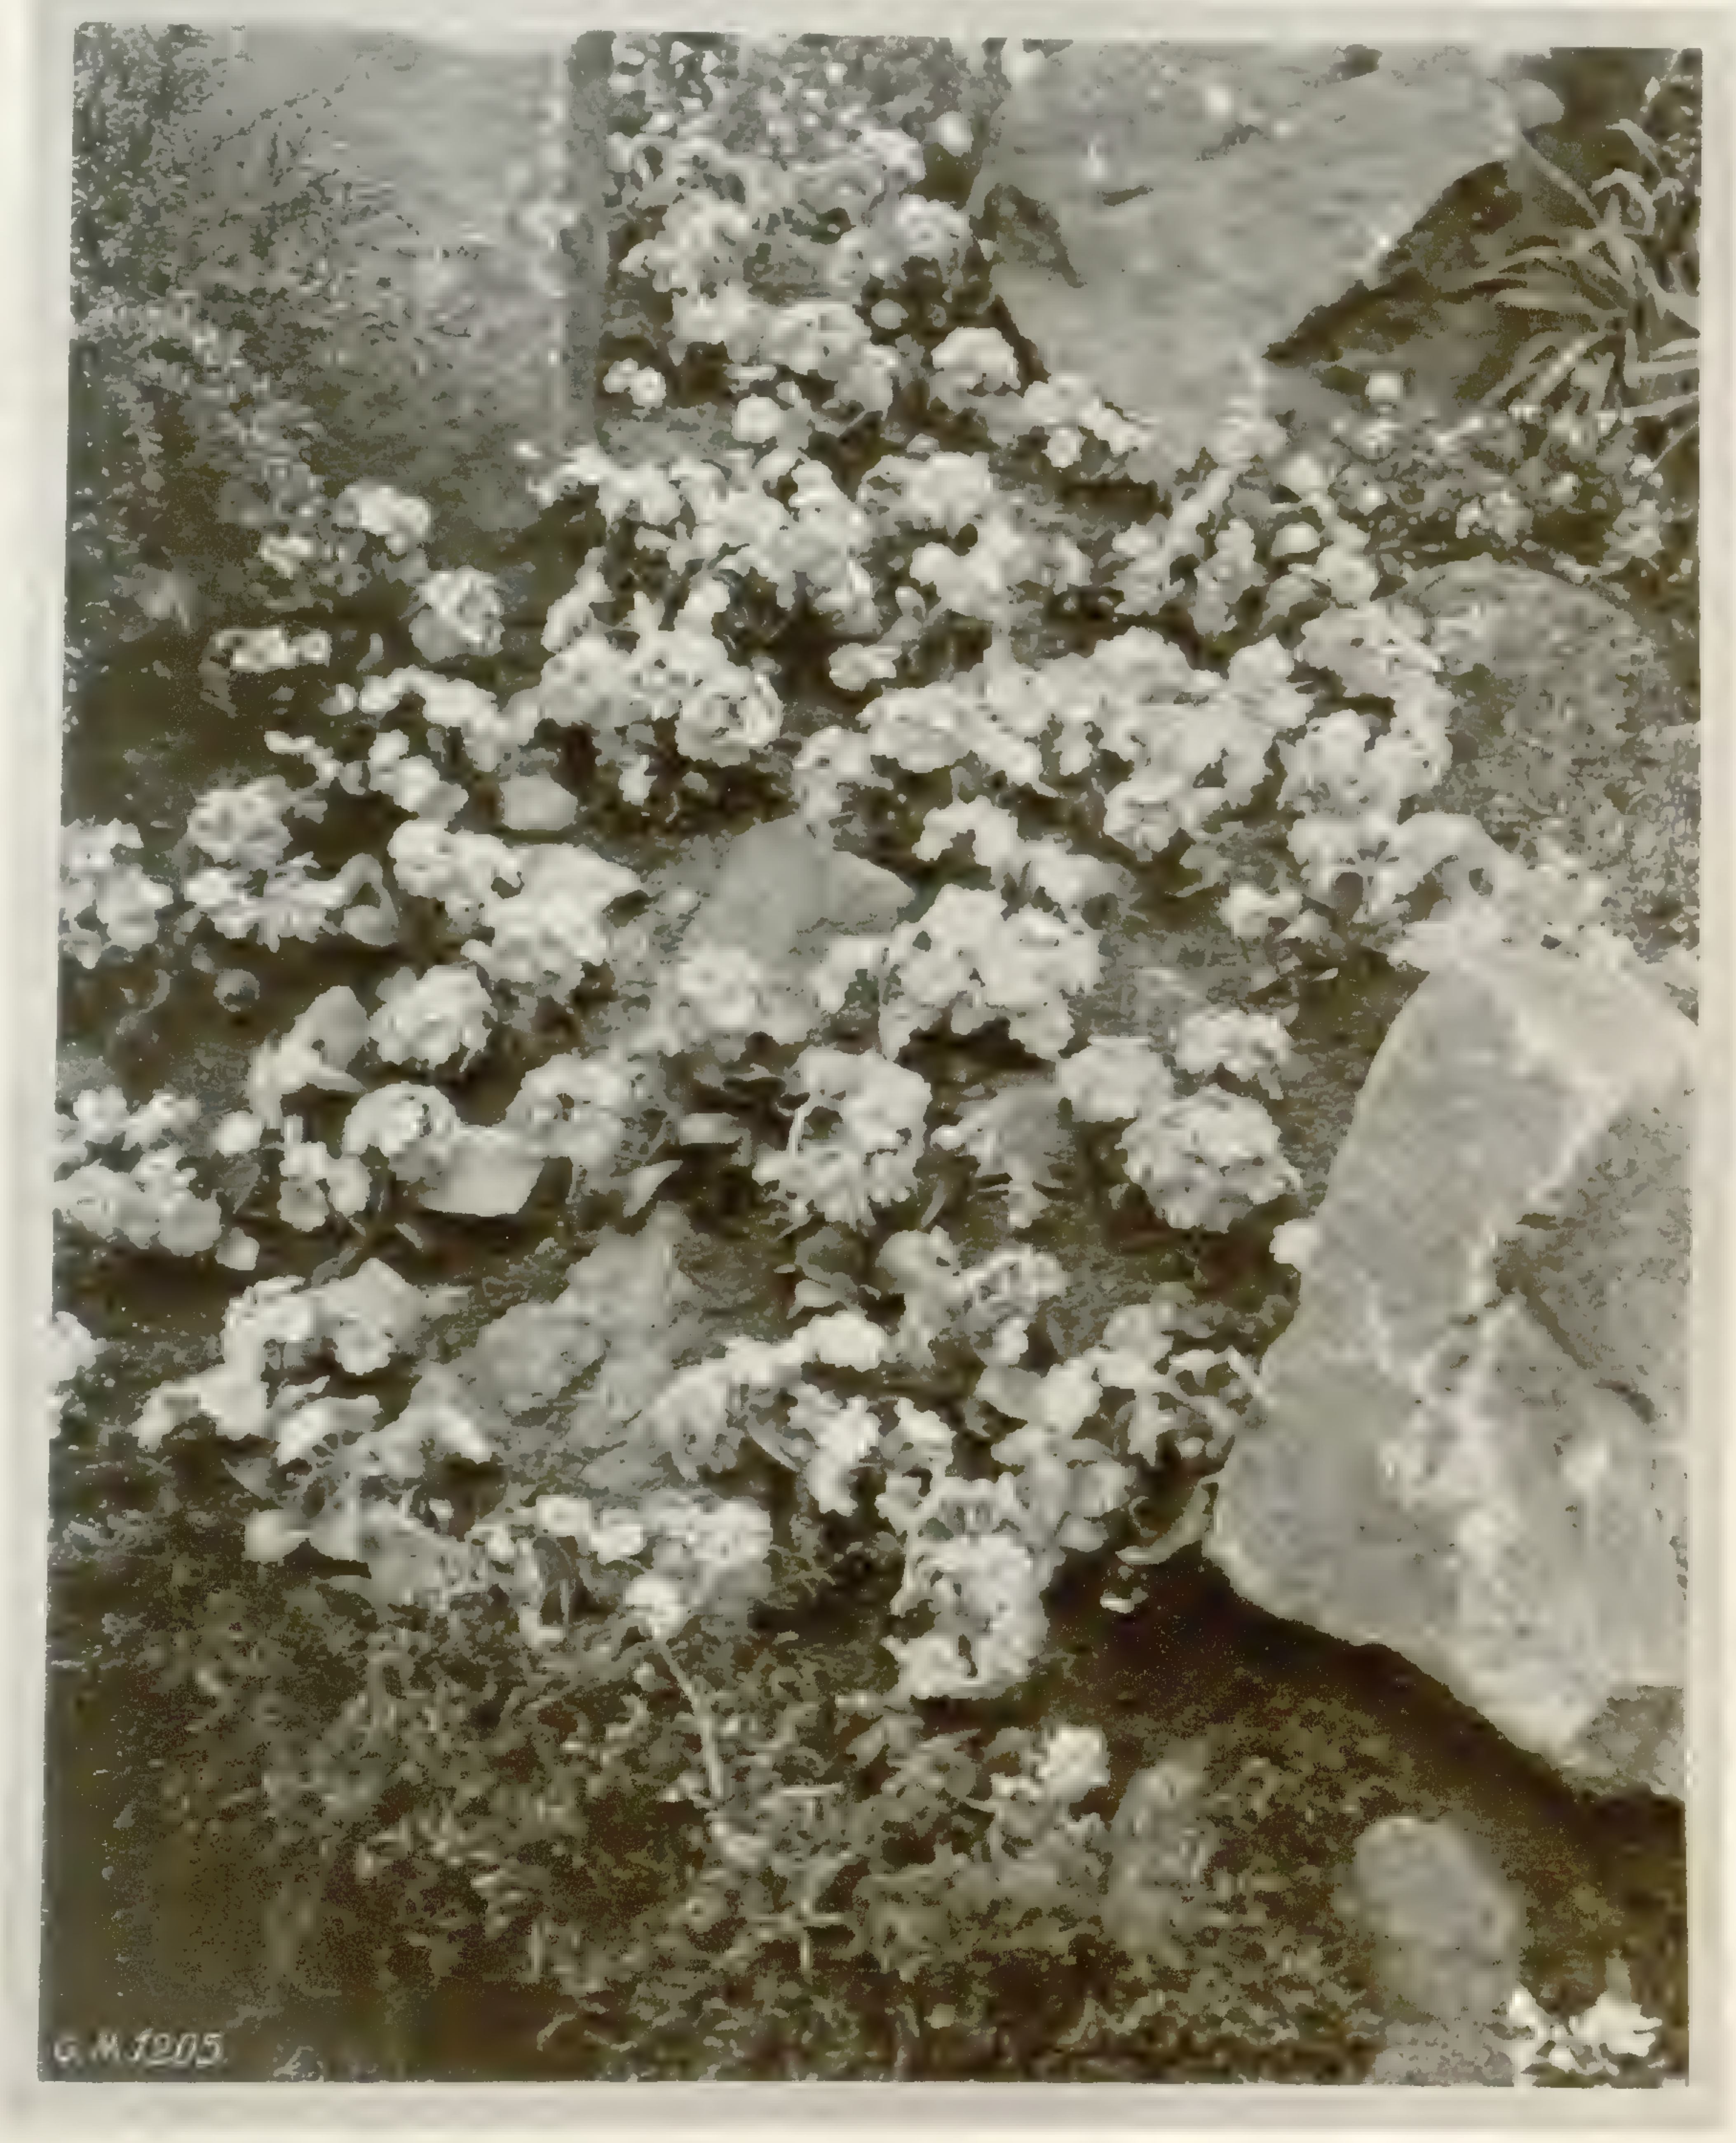
Of the fibrous-rooted, A. sylvestris is probably the best-known species, and the variety A. s. grandiflora is much the freest in flower; the double form is also very good, succeeding under indifferent conditions, but always flowering best in sunny positions. A. baicalensis is a most satisfactory plant to grow, producing its snowy flowers in great freedom, and increasing in a surprising manner even upon sun-baked slopes. It very much resembles A. sylvestris, of which it is probably a dwarfer geographical form. A. narcissiflora is a vigorous-growing species, attaining to a height of eighteen inches, and producing white flowers, which are tinted lilac on the reverse of the petals. A. globosa is a species having small globular red flowers, and on this account it is not without interest. It grows to a height of nine inches, the flower stems being leafy.

THOMAS SMITH.

Walmsgate Gardens.

PRIMULA VISCOSA VAR. MRS. J. H. WILSON.

It may be that some people do not love the colouring of this neat, free-blooming alpine primula, indeed, we have heard some people condemn it, but by far the greater majority of those who love the lowly flowers that are suitable for the rockery and the alpine garden have a great liking for this charming little primula. It bears its clusters of flowers on short spikes, after the manner of P. viscosa, but the flowers are larger, and of a rich and effective shade of mauve-purple or violet-purple. No one has yet exhibited this variety so well as Messrs. R. Wallace and Co., Colchester, who on several occasions recently have displayed it to great advantage at Vincent Square. They have, fortunately, not shown it in pots, but have exhibited little colonies of freely-flowered plants among rocks in a little rock garden. Visitors to the exhibitions have consequently had excellent opportunities for seeing it arranged in much the same manner as the rock garden, and for forming an opinion of its merits. A view of the colony thus arranged at the Royal Horticultural Society's meeting of April 19, is given in the present issue for the purpose of showing the usefulness of the plant, and also a very interesting, natural, and attractive method of exhibiting.



A COLONY OF PRIMULA VISCOSA VAR. MRS. J. H. WILSON.
As exhibited by Messrs. R. Wallace and Co., Colchester, at the Royal Horticultural Hall on April 19.

STAGENHOE PARK.

Beautiful and interesting gardens abound in the fertile county of Hertford, as has already been shown in these pages, but in addition to the many that are near such well-known centres as Hertford, Luton, and St. Albans, there are a large number that lie off the beaten track, and five miles or more from a railway station. One of these is Stagenhoe Park, at Welwyn, but best reached from Hitchin, seven miles away.

Stagenhoe Park, the residence of W. Bailey-Hawkins, Esq., is a charming old place, with a large, comfortable mansion set in a wealth of fine trees, and surrounded by flower, rose, fruit, and kitchen gardens of considerable extent. The latter are amply provided with high protecting walls, which on the inner side carry splendid peach, nectarine, and fig trees, on the southern and western aspects, apricots and plums on the east, and gooseberries, currants, and Morello cherries on the north

The upper portion of the fruit and vegetable garden is made beautiful as well as useful, as the paths are bordered with herbaceous plants, which in turn are backed by roses or fruit trees. A large pool that serves to catch the surface water of the garden occupies a prominent position here, and it is so well planted around with moisture-loving hemerocallis, arundos, and pampas grass, with cotoneasters, papavers, liliums, aubrietias, etc., along the top of the retaining walls, that an interesting rock and water garden is provided. A creeper-clad bridge spans the pool, made gay with tropæolums, ampelopsis, and hardy fuchsias, and around the whole is a ring of roses—rambling roses, and pillar roses—clothing poles and meeting each other along the connecting chains. This circle of roses is really the point to which a pergola leads from north and south. This rose pergola is made of oak cut on the estate, and it has now been about three years in position. The roses have done splendidly all around, the chief varieties being Claire Jacquier, Celine Forestier, Veyrat Hermanos, Gardenia, Mrs. W. Flight, Tea Rambler, Paul's Single White, and Blush Rambler, with Euphrosyne, Madame Alfred Carriere, Dorothy Perkins, and Crimson Rambler, as the most successful varieties on the pillars and chains.

But the beauty of the roses and herbaceous plants is likely to prevent proper attention being paid to the skilfully trained fruit trees on the walls, the bush apple trees along either side of the central pathway, and the capital crops of vegetables lower down. Mr. W. Munt, the head gardener, is an old pupil of Mr. Beckett's, and so it is but natural he should excel as a cultivator of vegetables. He is particularly successful with celery, onions, and peas, and at the exhibitions in the neighbouring towns, and even in the adjacent county of Bedford, he is seldom beaten for vegetables. Given reasonable facilities a gardener's ability must now, as always, be largely estimated by the quality and quantity of fruits and vegetables he produces. Mr. Munt puts these two things first, and he has now brought this enclosed garden of three acres into a very high state of cultivation. One of Mr. Munt's weaknesses is for half-standard gooseberries, as he believes by their use the bushes, fruit, and ground below are more easily kept clean and free from pests.

The glass department is not extensive, but the houses are very convenient. There are three vineries, one of Muscats, and one of Black Hamburgh, with the third containing Mrs. Pince, Lady Downes, and Melton Constable, the latter regarded as far finer than Gros Colmar, and of better flavour. Good bunches, not over large, but well finished, are produced in all three houses each year. Several houses are devoted largely to winter-flowering subjects, such as Begonia Gloire de Lorraine, salvias, pelargoniums (very fine), and eupatoriums. Mr. Munt roots cuttings of Eupatorium petiolare in the spring, and the resulting plants come into flower just before the chrysanthemums; they are cut back and again potted, and give an abundance of flowers in March. One small house is devoted to the more popular orchids, and Dendrobium phalænopsis is well grown. Crotons fill another small house, with calanthes on the shelves, and calanthes are managed well. There are low pits for tomatoes, melons and cucumbers, and others for cyclamen, vardias, Primula Kewensis, ferns, tropes, poinsettias, etc. In the low pits and frames, the garden furnished, and it would be of immense tance to many a gardener if the employ followed the example of Mr. Bailey Haw kins in providing these handy and comparatively cheap aids to cultivation.

Both summer and spring flower gardening are carried out vigorously and ex sively at Stagenhoe Park. There is formal flower garden in front of the sion, each half containing twenty beds. The beds are cut out in and the aspect is south-east. Last as the illustration shows, the cipal beds were filled with Calceolaria plexicaulis and Lobelia cardinalis. The extreme corner beds were planted Paul Cramfer pelargonium, tall plan Abutilon Thompsoni, centaureas, lobelias, and dwarf alyssum. Four of the beds con-

STAGENHOE PARK—WATER GARDEN AND ROSERY.

tained heliotropes; four others were planted with Madame Crousse ivy-leaved pelargonium; four with Begonia Worthiana, and four with the brilliant Salvia splendens var. Zurich, and Swainsonia alba. For the spring display aubrietias, violas, arabis, daisies, and bulbs of many kinds are used. It will be gathered from these remarks that the provision of bedding plants is an important part of Mr. Munt's duties. The flower garden is a fine feature, well in view from the house and flagged terrace, and backed up by great groups of rhododendrons and thorns, and the great lime, chestnut, and oak trees in the park beyond, and from which it is divided by an ornamental ivy-clad balustrading.

A fine old conservatory, spacious and substantial, and partly shaded by a grand old Cedar of Lebanon, is attached to the mansion, and is used as an extra withdrawing room. It has walls 2ft. 6in. thick and iron-framed doors and windows. Outside its walls are covered with the small-leaved Ampelopsis Veitchi, and inside are splendid kentias and smaller arecas, Cocos Weddelliana, and Geonoma gracilis, with great baskets of nephrolepis and asparagus suspended from the iron roof rods, that also serve to carry the bougainvilleas that are a pleasing feature when in bloom.

Running at right angles to the mansion and flower garden is a broad path that descends, terrace fashion, to the Wilderness garden. The walk is a long one, and the series of old broad stone steps show that it is the design and work of many years ago. Along the left-hand side of the walk is a broad border backed by one of the high walls that skirt the upper fruit and kitchen garden, and pierced by the handsome Stag gates so well illustrated in the present issue. This side of the wall is clothed with a great variety of flowering and other shrubs, the most notable being the wistarias, Cercis siliquastrum, magnolias, Acer negundo variegata, very fine for the purpose, double kerrias, Ceanothus americanus, laburnums, viburnums, and jasmines. Popular herbaceous subjects fill most of the border, but dahlias are grouped here and there in the summer and autumn.

There are five sets of stone steps on the walk, and each set is ornamented by four large ornamental stone vases, twenty vases in all, and each one is filled with effective flowers during the summer season, fuchsias being the chief subjects placed in them. To the right, as the path descends, one notes many fine old specimens of Abies excelsa, Sequoia gigantea, and S. sempervirens, Cedrus Deodara, Picea Pinsapo, and various cupressus. The walk ends at the woodland gate, but a path beyond leads away to St. Paul's Walden, through the woods.

The Wilderness garden is entered from the end of the walk, and this interesting spot is bounded on the lower side by a long and quaint old pleached alley, composed of interlacing lime trees trained to meet overhead, and kept closely pruned to spurs each season. The spot is in process of transformation from a wilderness to a garden. Each year some part is thinned out, and new and interesting features are created. Spring flowers, flowering shrubs, and hardy ferns already fill many a charming spot. Winding paths pass under the tall trees and amid great masses of rhododendrons and laurels, and provide a cool retreat in the hot summer days.

Between the Wilderness garden and the southern corner of the flower garden is a very old rosery, at least the site and the high, dense surrounding hedges of roses are old, but inside these hedges of ancient rambling roses are newly-made beds planted with Caroline Testout, Captain Christy, La France, Madame Pernet Ducher, Marie Van Houtte, Gustave Regis, Maman Cochet, Madame Lambard, and Madame Abel Chatenay, while four large standards of Crimson Rambler add their quota to the charm, beauty, and fragrance of this very old English and yet also quite modern feature of a charming and interesting establishment.

There are many other points of interest at Stagenhoe Park. There are the ancient chestnuts that formed part of a big drive planted about three hundred years ago. At the lower end of the park is a big lake, with islands. All around it are red and white thorns, but the water plants in the lake and along its margin are wild British subjects left to their own sweet will. When the Wilderness garden is finished, Mr. Bailey Hawkins has in the lake and its surroundings magnificent scope for the production of a garden scene unsurpassable in the county. The site and the water are there; clearing and thinning and planting are alone needed to make Stagenhoe Park a more beautiful place even than it is at present. The splendid cricket ground and pavilion must not be omitted, for Mr. Bailey-Hawkins and his sons take a great interest in the employees, and the estate cricket club is able to hold its own with the teams from the surrounding estates and villages.

Chas. H. Curtis.

THE WILD GARDEN.

It is an open question whether any other aspect of garden beauty can vie successfully with the wild garden. Certainly one meets with charming effects within the ordinary limits of the garden, but glorious though these "set effects" may be, they lack the wide range and the wondrous possibilities of the wilder portion. In it there is no place for formalism, no rigid lines, no carefully studied geometrical features, nothing which speaks of artificiality, stiffness of design, or primness of form.

Instead, there is a natural grace, an exquisite informality of outline, a daintiness of effect, which tells of the wisdom of taking Nature's own way of naturalising Nature's own subjects. With natural groupings, broken or undulating ground, and the exercise of thought in the making, one can obtain a hundred idealistic pictures of garden beauty, where perhaps only one would be given if a bed or border were under notice. I do not know if the idea of the natural garden is recognised at its full value by the majority of my readers, but it is apparent that this style of garden adornment is greatly on the increase, and its potent possibilities for good are surely (if slowly) making themselves felt in the minds of the garden-loving community.

In the wild garden one can group many shrubs and trees (particularly those which make a profuse display of blossom) in such a manner as will show their full beauty to advantage. There is no longer the need for close pruning and rigid shapeliness, but one can give the subjects their full freedom in order that they may show their grace of outline. The flowering trees and shrubs of spring and early summer will contribute to the making of a beautiful (yet natural) garden scheme. Starting with such subjects as Daphne mezereum, the andromedas, almonds, early-flowering double peaches, prunus, etc., and on through the maze of azaleas, cherries, rhododendrons, philadelphus, syringas, deutzias, pyrus, spiræas, rubus, roses, forsythias, berberis, cratægus, kerrias, and a host of other subjects, we have a profuse and continuous display of floral treasures.

With the herbaceous perennials one can work wonders in the way of groupings. Drifts of alstrœmerias, montbretias, phloxes, campanulas, delphiniums, lupins, rudbeckias, asters, helianthus, scabious, irises of varied types, monardyas, myosotis, œnotheras, etc., masses of pæonies, aconitums, anemones, centranthus, doronicums, heleniums, hellebores, hemerocallis, primulas, polygonatums, and light waving groups of eulalias, arundas, gyneriums, phalaris, and bamboos, give one a diverse, yet noteworthy, group of suitable subjects.

By watersides, or in low boggy places, one can grow the golden calthas, the showy lythrums and lysimachias, lobelias like L. cardinalis and L. syphilitica, the best of the astilbes and spiræas, irises like I. Kæmpferi, I. aurea, I. monspur, I. spuria, I. siberica, and I. virginica, the moisture-loving primulas, Myosotis palustris, mimulus, also foliage plants of the character of the gunneras, rodgersias, Saxifrage peltata, osmundas, struthiopteris, funkias, Elymus glaucus, Juncus zebrinus, J. spiralis, and the petasites. By the free use of selected forms of some of these subjects many striking little bits of scenery may be obtained, and at the same time one is able to realise to the full their decorative character.

Open exposed slopes may be treated as a garden of heaths, using a varied selection of the best varieties of Erica vulgaris, E. mediterranea, E. tetralix, E. vagans, E. carnea, etc. Soil of a peaty nature should be obtained, and the groupings made as natural and diverse as possible. Among the heaths, at intervals, a few low pines or other trees and shrubs of moorland character can be placed with advantage, as they will give tone, and break the lowness of the outlines of the ericas.

Then, again, in the wild garden one has or can introduce, a dell-like depression, where ferns, anemones, foxgloves, and many plants which love cool and shade will revel under suitable conditions. There is a charm in such a cool retreat during the summer months, where one can view the beauties of the aspleniums, aspidiums, lastreas, polypodiums, polystichums, blechnums, scolopendriums, mingled with light intersecting groups of waving blossoms. A rough-stepped pathway leading down to the dell, o'erhung with light-growing shrubs, with a mossed pathway or stepping stones winding through the lower levels, will give access to the fern colonies.

Furthermore, there is the ever-present question of the naturalisation of bulbous flowers, and nowhere can this be better done than in the wild garden. Here, amid sheltered surroundings, one can enjoy the first beauty of the snowdrops and winter aconites. Here one is greeted by colonies of scillas and chionodoxas, banks are lit by the gold of the crocus, and gemmed with the "haunting blues" and the "pure whites" of the muscari. Sheets of sulphur, white, and gold represent the glorious narcissi, while later the deep blue sheen of the bluebells, the rising spikes of lilies and ornithogalums, and other subjects will continue the display.

It matters little which way one may turn, at all points the pictured beauty is apparent, with its simplicity, its natural unrestricted outlines, and its ever-present charm. From the very dawn of spring until the days of the late autumn foliage the wild garden is an everchanging panorama of floral beauty, giving to the beholder the real charm and endless delight associated with Nature's garden.

P. S. Hayward.

NEW PLANTS, ETC.

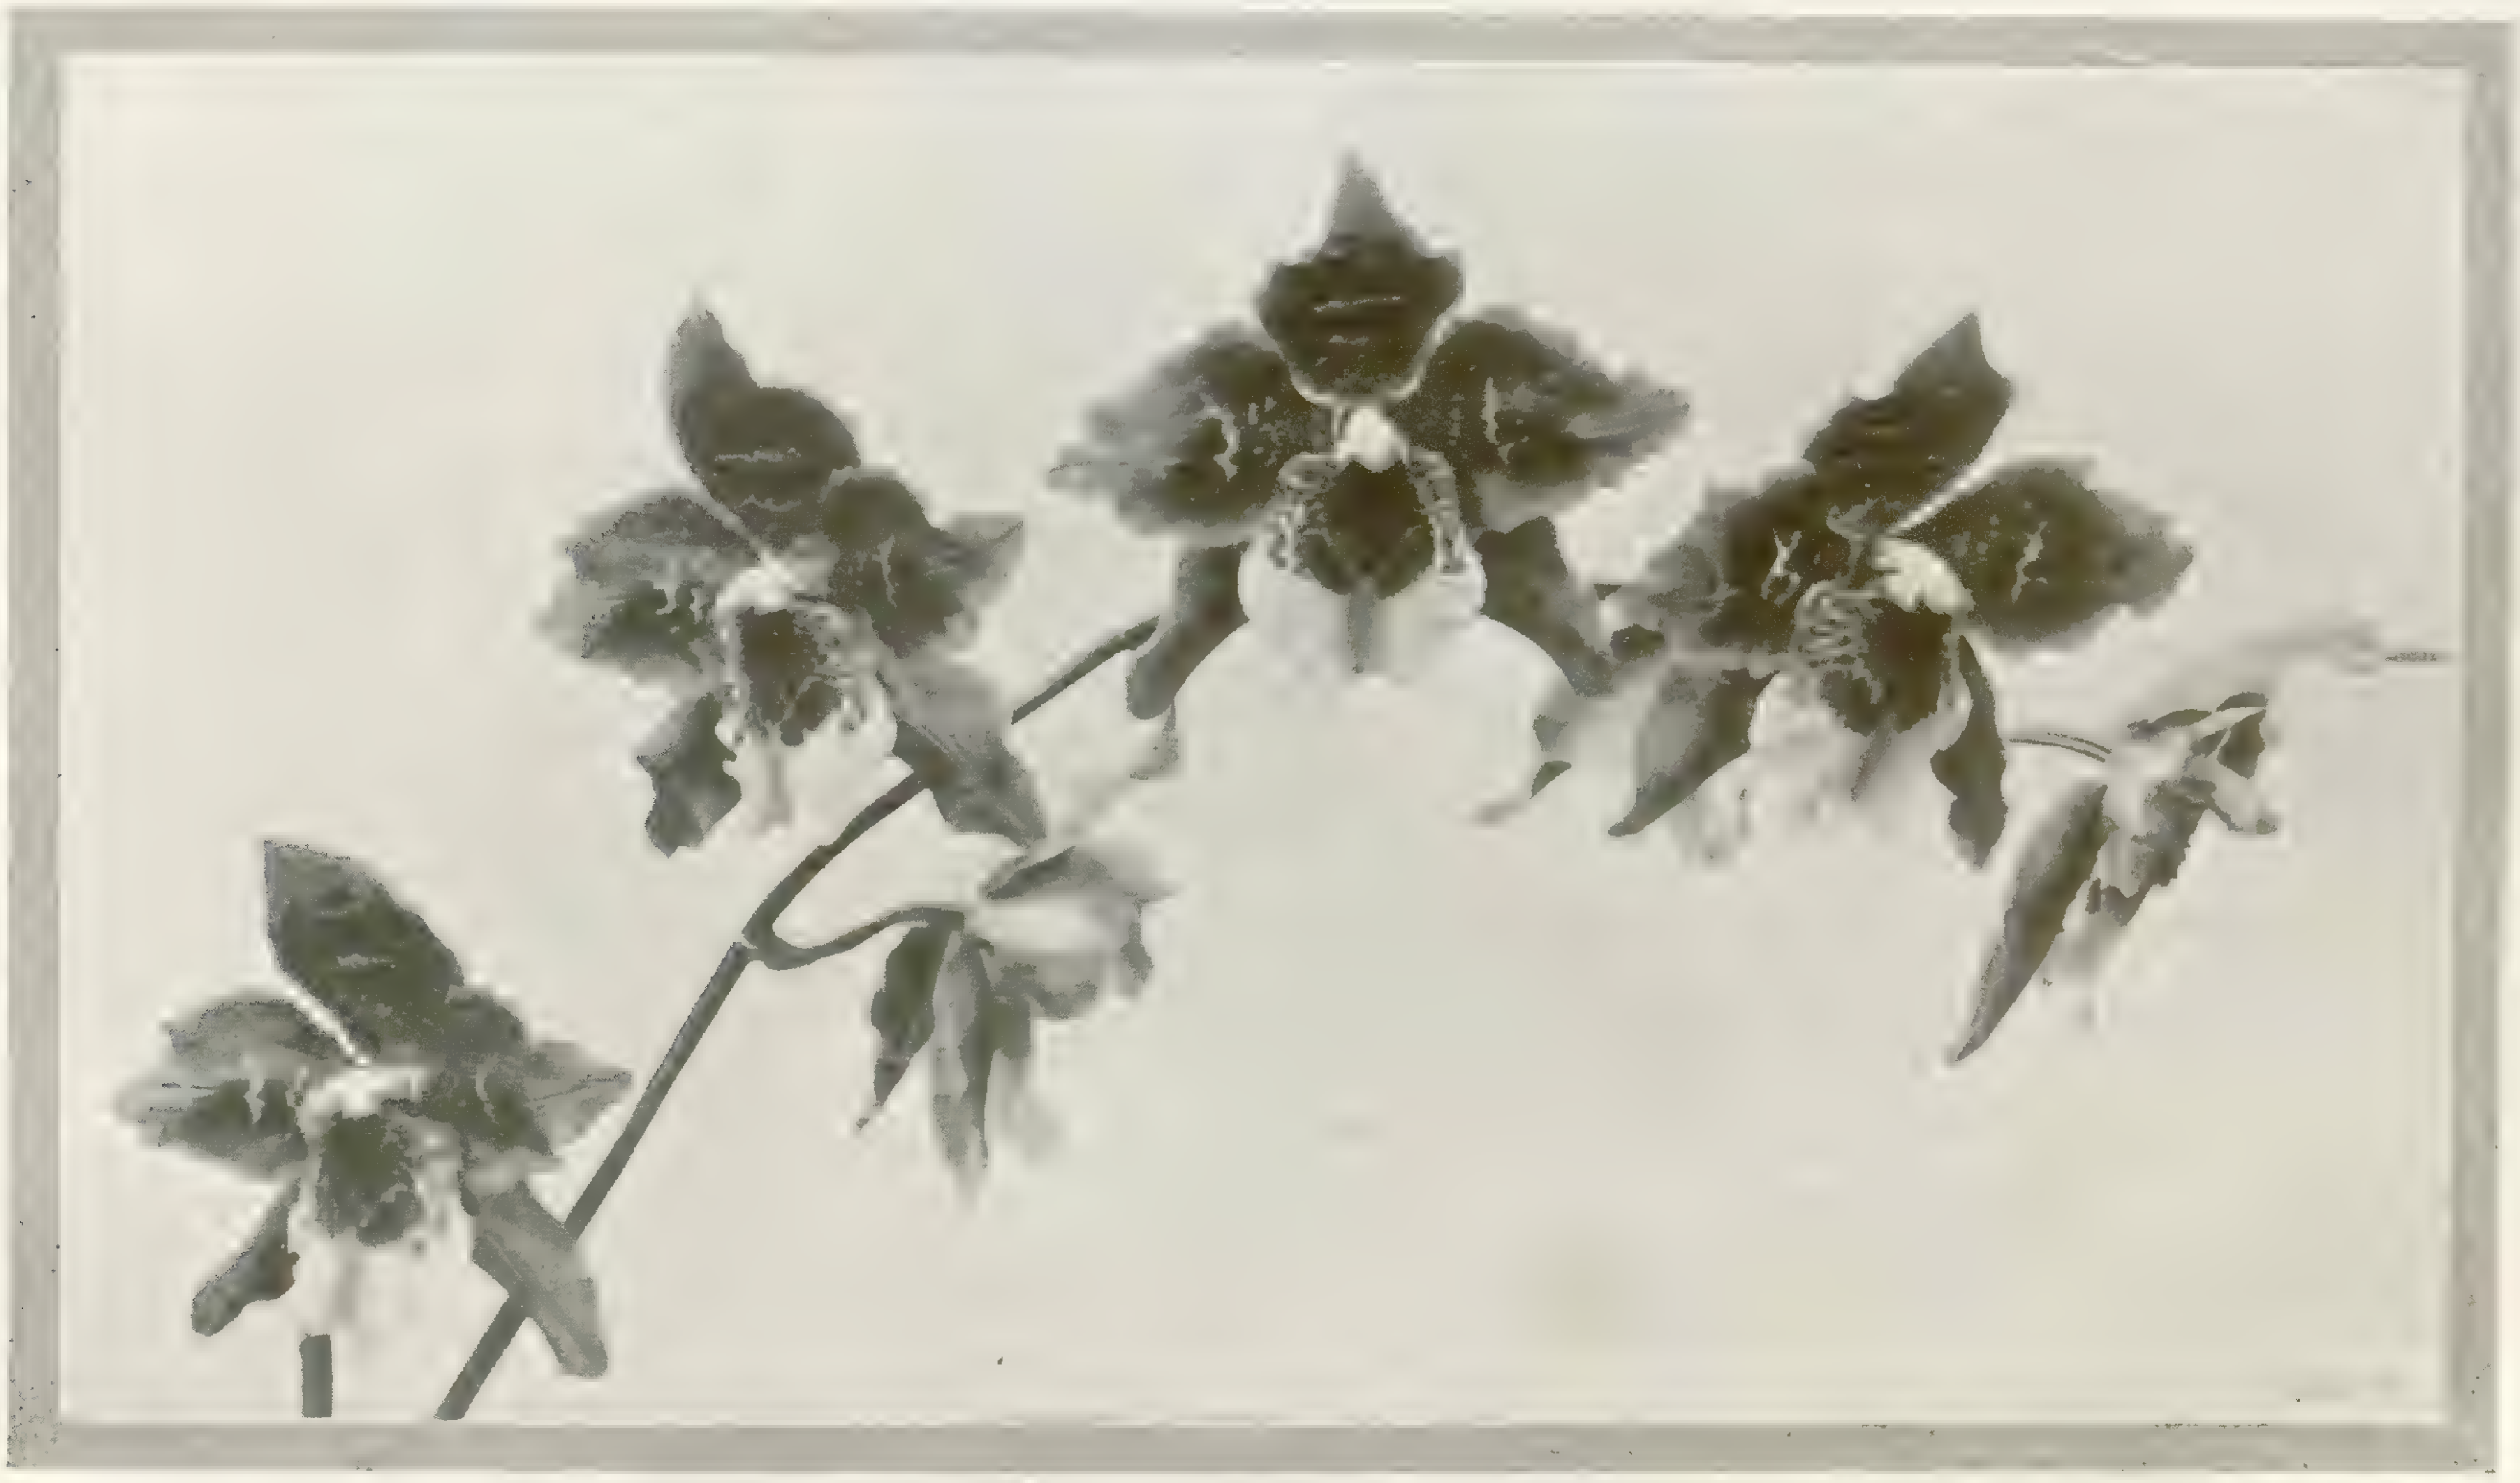
◆

SOBRALIA CLIFTONIÆ.

This very beautiful new species was figured on page 325 of our issue of April 23. It is from Ecuador, and has more substantial blooms than those of the white form of Sobralia macrantha. The flowers follow each other in regular succession over a considerable period, but only one expands at a time from the same stem. The flowers are pure white, except for faint mauve-purple stains in the throat of the lip. A.M., R.H.S., April 19. Messrs. Sander and Sons, St. Albans.

ODONTOGLOSSUM REGALE ROSEFIELDIENSE.

This is an interesting hybrid from O. Lawrenceanum and O. ardentissimum, and in shape and habit it somewhat resembles the latter parent, but the flowers are yellow, heavily marked with deep brownish-red. A.M., R.H.S., April 19. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.



ODONTOGLOSSUM LAWRENCEANUM COBB'S VARIETY.
A handsome hybrid, blotched with brown-purple on a yellow ground. A.M., R.H.S., April 19. W. Cobb, Esq.

ODONTOGLOSSUM ARNOLDIANUM.

This is a distinct and handsome hybrid of unknown parentage. It has broad segments, the lip being especially broad, white, with purple marks. The sepals and petals are brownish-purple, the colour being broken up by white markings. A.M., R.H.S., April 19. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

MILTONIA PHALÆNOPSIS McBEAN'S VAR.

In this variety the rosy markings on the white lip are considerably extended, while the white sepals and petals have a rosy base. A.M., R.H.S., April 19. Messrs. J and A. McBean, Cooksbridge.

ODONTOGLOSSUM LAWRENCEANUM COBB'S VARIETY.

This is a particularly fine form of the hybrid between O. triumphans and O. Rolfeæ, it has broader segments than the type, and the bright yellow ground colour is broken up by large central blotches of brown-purple. A.M., R.H.S., April 19. Walter Cobb, Esq. (gardener, Mr. C. J. Salter), Normanhurst, Rusper.

ODONTOGLOSSUM ROSSIANÆ RUBENS.

A very attractive form of the hybrid between O. Rossi and O. Adrianæ. It is of larger growth than O. Rossi, and has flowers as large as those of O. Adrianæ, but showing the influence of O. Rossi. The latter have white based purplish sepals and petals freely and distinctly spotted with dark rose purple. The rosy lip has a deep yellow crest. A.M., R.H.S., April 19. Mons. Henri Graire, St. Fuscien, Amiens.

ODONTOGLOSSUM CRISPUM ST. FUSCIEN.

A very handsome, rounded, and substantial variety, pure white, with heavy blotches of rich red-purple or crimson. A.M., R.H.S., April 19. Mons. Graire.

AURICULAS.

Warley.—A remarkably distinct new show auricula of fine size and form, making a quite new addition to exhibition varieties. Its rounded flowers are of a colour difficult to describe, but heliotrope-pink about fits it. There is a fine clear ring of white paste round the yellow centre. A.M., R.H.S., April 19. Mr. James Douglas, Great Bookham.

Roxburgh.—A very bright purple alpine auricula, the colour shading to maroon-purple round the golden eye. A.M., R.H.S., April 19. Mr. James Douglas.

Victor.—A self variety, having fine bright maroon-purple or crimson flowers, with white centre. A.M., R.H.S., April 19, Mr. James Douglas.

HIPPEASTRUMS.

Cardinal Wolsey.—A wondrously beautiful hippeastrum, of fine form, size, and substance, the colour being intense and rich rosy-red, with a faint suffusion of violet, and some white veinings at the base. A.M., R.H.S., April 19. Lieut.-Colonel G. Holford (gardener, Mr. Chapman), Westonbirt, Tetbury.

Gereant.—A splendid and brilliant variety, the flowers being wholly of a rich shade of deep clear orange-scarlet. A.M., R.H.S., April 19. Lieut.-Colonel Holford.

Calypso.—A fine variety of beautiful form and unusual substance; white, heavily veined, and shaded with rich rose-red.

PRIMULA CILIATA VAR. GENERAL STEWART.

Under the above title a neat little primula was shown, with rather large auricula-like flowers, borne on short spikes. The colouring is bright brownish-crimson, with yellow eye. The plant has something of the habit of P. viscosa, and this is probably one parent, with P. auricula as the other. A.M., R.H.S., April 19. Mr. W. Cranfield, Enfield.

NARCISSUS MATTHEW ARNOLD.

This is a particularly beautiful poeticus variety, of medium size, but with broad, solid white segments, that make up a flower of the highest florist's type. The cup or crown is brilliant crimson. A.M., R.H.S., April 19. Messrs. Cartwright and Goodwin, Kidderminster.

APPLE WAGENER.

A late culinary variety that has a good reputation for regular and heavy cropping. It is an American introduction, of medium size, roundish, and bright scarlet. A.M., R.H.S., April 19. Mr. W. Crump, The Gardens, Madresfield Court.

Calceolarias.—These beautiful old flower-garden favourites sometimes disappoint the cultivator grievously; they die off and leave ugly gaps in the beds just at a time when all the other plants are growing nicely. I have had many plants die in this way, no matter how well they were watered and cared for. Then I adopted the plan of planting them out at the end of April, quite a month before the ordinary summer-bedding plants were put out; and great care was taken not to bury the stem of the plant. Failures never occurred after. It is not possible in all cases to put out calceolarias thus early, but I am sure they succeed better so dealt with.—George Garner.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d., cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

REV. F. PAGE-ROBERTS ON ROSES.

The gardeners of Basingstoke and district recently had the privilege of listening to a lecture on roses by no less an authority than the Rev. F. Page-Roberts, the renowned amateur rosarian and president of the National Rose Society. From such a high authority a lecture dealing with the cultivation of roses could not fail to be of universal interest; and with this in view, the writer has essayed to embody the remarks of the president in the following notes.

AURICULA WARLEY.
A distinct self variety, the body colour heliotrope-pink. A.M., R.H.S., April 19.
Mr. J. Douglas.

Soil Conditions.

Soils are of different natures and textures, which is a fact that does not seem to be properly understood by many amateur growers. There may be something in the soil, or something wanting in it, that will set at naught the most perfect system of tillage and the most suitable dressing of manure. It has been pointed out that such soils very probably lack rose food, especially old cultivated kitchen garden soils. With regard to the inequalities of soils, there is a good example in Hampshire. At Strathfieldsaye, the home of the Rev. F. Page-Roberts, a quantity of clay predominates; while only a few miles away in the Basingstoke district, there is a great deal of chalk. The latter, it may be remarked, is not the most suitable soil for roses. Yet they will, of course, grow on nearly all soils; and even these calcareous lands have borne some of the most beautiful specimens, but it required very rich cultivation to grow them. Drainage is an important feature in rose culture, and unless the surplus moisture is drained from the soil by a proper system of pipes, the best results cannot be expected. Excessive drainage must, however, be avoided, as it is then difficult to keep the water on the land at all. It may also be mentioned that the climate is as important in rose growing as it is in farming.

Choice of Roses for Different Soils.

One salient point to be noted by all rose growers is a knowledge of the texture and quality of the soil, and another is to then choose roses for that soil. If it proves to be heavy and retentive, some of the best and strongest of the hybrid teas or the hybrid perpetuals are most suitable. Tea roses should be avoided on such heavy soils. If, however, the soil is light in texture and sandy in nature, it is useless to attempt the cultivation of hybrid perpetuals. Those growers who are unfortunate or inexperienced enough to choose the wrong varieties in this manner generally come to grief. Their roses dwindle and die away; and they anathematise the soil and everything else, except their own choice of roses. A great deal may be said in favour of the hybrid teas, that class of rose which has come so much to the front since 1890. They will grow almost anywhere, in almost all soils, and they are much more perpetual in blooming than the so-called hybrid perpetuals, their season often being prolonged from May to November. Many of the latter class only bloom well in the first part of the summer, and rarely make good secondary bloomers. That beautiful rose Madame Gabriel Luizet for example does not bloom at all in the autumn. There are some of them, however, particularly the more recently introduced varieties, that resemble a hybrid tea more than a hybrid perpetual. An example of this kind is to be found in the rose Hugh Dickson. This variety was brought out some years ago, and is one of the most beautiful roses we have. In the hybrid teas that have yet been introduced, however, we yet await those deep rich reds and fine scent that are naturally associated with the best roses. Hence it is difficult to dispense with some of the old favourite hybrid perpetuals, which exhibit these characteristics to such a marked degree. The latter are also more hardy than the hybrid teas; though the last-mentioned roses can be easily protected by hoeing the soil three or four inches up the stem.

Deep Cultivation Essential.

Six hundred years before Christ, Pliny, referring to the cultivation of roses, said: "Be careful and dig at least two spades deep." And this deep cultivation is no less important for roses at the present day. Two spades' depth of earth should be taken out, and the bottom soil broken up with a fork. One of the most successful methods of growing roses is to select a nice piece of grass land, cultivate it deeply in the above-mentioned manner, and then turn the turf into the trench and chop it up nicely. On top of this a thick layer of good manure should be placed, and that in turn covered with a little soil. Then the rose should be placed in position, the roots spread out carefully, and some nice dry light soil shaken amongst them. Of great importance is it to see that the manure is kept well below and under the roots. The supply of nourishment is then derived from below, which is preferable to surface manurings; although, of course, the latter system must be resorted to in the case of beds already established. With further regard to the planting of roses, it is essential to see that the soil is well trodden, for roses like a nice firm bed. The junction where it is budded should be at least an inch below the surface of the soil, but not too deep; and at the time of planting a useful stimulant can be given in the form of a little bone-meal or crushed bones. With regard to the most suitable time at which to plant roses, the earlier they are got in the better. A very good time is whenever circumstances are propitious in October; but at all events, the months of March and April are to be preferred to January or February. Before planting roses in spring-time they should be pruned, and subsequently every possible attention should be given to the destruction of insect pests, caterpillars, etc. The latter are a considerable source of trouble to the grower, and the trees should be examined once a day, or even twice if need be.

Manuring of Roses.

Roses are composed largely of potash, and for this reason some form of potassic manure is most beneficial to them. Among other things, the sweepings of garden refuse, prunings of old wood, etc., when burnt, form an excellent dressing; and this can be supplemented with a quantity of bone-meal, soot, and dried chicken manure. In applying such dressing it is advisable to prick or hoe the manure in, but care must be taken not to disturb the fibrous roots which run near to the surface. In the growing season roses derive an immense amount of benefit from liquid manure, and one of the best means of preparing this is to soak a barrowful of cow manure together with a bag of soot in a tub of rain-water. Before being used the liquid should be well stirred and diluted with water until it is of a pale yellow colour. One important point concerning the application of any form of liquid manure, either for roses or for any other plant, is that it should not be made when the soil is dry, but always when the ground is comparatively moist, preferably after a shower of rain or when the plants have been well watered. Hoeing is a most beneficial means of conserving moisture around the roots of roses; and if performed the day after the water has been given, a nice friable tilth will be secured. This will obviate the necessity for frequent waterings during droughty weather.

In autumn a sprinkling of basic slag may be applied to the beds; and as soon as a good growth commences, nitrogen may be advantageously supplied in the form of nitrate of soda. A light dusting of the latter fertiliser may be given each week until the buds have been well formed; but this manure must on no account be allowed to come into contact with the foliage, or it will have a burning effect. R.

(To be continued.)

"SOILING" POTATOES.

The "soiling" of potatoes is a somewhat different process to the earthing-up of the plants. By "soiling," I mean placing soil right in the centre of the growing haulm; but, of course, this cannot be done where there is only one stem to the root. Few roots, I am afraid, will be found to have one stem only, as there are too many sets planted, in these days, with several sprouts on them.

But I am a firm believer in soiling potatoes, as I feel sure that the crop is thereby increased in weight, and less damaged by disease.

My father once had a long, narrow strip of ground planted and treated as follows. Holes were made about 2ft. apart each way all over the plot, and some manure was mixed with the soil in the bottom before the tubers were laid in. Then the soil first removed was replaced, covering the tubers. This method was adopted on account of lack of time for digging in or ploughing in the potatoes, and the ground had previously been well broken up. With the exception of necessary hoeing nothing further was done to this crop, except the soiling—the placing of soil in the centre of the growing haulm. I have often heard my father say that the crop of tubers was the largest he ever saw, and he annually had to do with the planting and cultivation of many acres of potatoes.

He had boys to gently spread out the potato tops while men followed and placed a spadeful of soil in the centre of the plant; this was done in addition to the usual earthing up with a proper plough. I, too, have adopted the system from time to time, and have found that the tubers are larger than those from plants not so treated. G. B.

PERPETUAL CARNATIONS AS SUMMER BEDDING PLANTS.

We are a long way past the experimental stage in the practice of bedding out perpetual carnations in summer, in fact we can claim to have reached firm ground where all room for doubt can be put away.

It has been proved in nurseries, private gardens, and public parks that for purely decorative purposes the perpetual carnation is superior to the old border carnation, not only because it can be planted in the spring, thus allowing for early spring bedding plants, but chiefly on account of the continual crop of bloom it produces from May to October. Like their contemporaries of the border section, perpetual carnations prefer a light, open position, and summer cultivation. Old blooms should be removed, and the others supported. Little, if any, additional care and attention is required, and the perpetual carnation will have a tendency to lighten, rather than add to, the already heavy burden placed upon gardeners during the summer months.

All that remains for us at present to decide is, what is the best kind of plant to bed out—a young plant in a three-inch pot, or one in a five-inch pot, twelve months old.

The younger one, if planted when in a free, vigorous condition, will naturally have a fresher and more thrifty appearance, but no matter how early they may have been propagated, and stopped, they will not commence to flower until June, and will even then have a tendency to grow. This can be partly overcome by stopping one of the growths, and allowing the remainder to run off to flower. With this practice from the commencement of flowering a continuous supply of flowers will be given.

If one-year-old plants are bedded out they can be had in flower practically from the day of planting. Late spring-propagated stock grown during the winter in a cool frame, make capital plants for the purpose, and should be fine stock in five-inch pots, in bud at the time of planting; but those which have produced an early winter crop of bloom will also do admirably for this purpose, in fact, some prefer them. Hyde Park illustrated to us only last summer how two-year-old plants from nine-inch pots produced masses of bloom during the entire season, and all that is required is to edge the beds with young plants, or carpet with violas, etc.

Some of our most progressive gardeners will no doubt shortly be telling us of good mixed beds in which perpetual carnations form a prominent part. Undoubtedly many delightful combinations could be thus made.

Regarding the best varieties for the purpose of summer flowering out of doors, few exceptions from the general collection need be made, but perhaps the pick are: Britannia and Beacon, scarlet; White Perfection, White Enchantress, Lady Bountiful, white; Rose Enchantress, Mrs. Burnett, and Enchantress, pink; and Black Chief and Harlowarden, crimson; while among fancy varieties, Helen M. Gould, Oriflamme, and Jessica have proved themselves to be superior for this purpose.

Montagu C. Allwood.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers or by post 1s. 3d., from W. H. and L. Collingridge, 148, Aldersgate Street, London. The book is freely illustrated, and the cultural details thoroughly practical and up to date.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

PHAIUS.—The eastern section of the evergreen species of this genus will have now passed out of flower. There is a short period between the flowering and the production of new growths, when it may be considered that the plants are in a dormant stage. Otherwise it is not desirable they should at this period be removed to a lower temperature. They may, however, be rather drier about their roots, only sufficient root moisture being necessary to retain the plants in a normally plump state, and as at this season the atmosphere is usually well charged with moisture, it will be found that very little water will suffice. Immediately the new growths make their appearance more liberal treatment must be given. When these growths have advanced a few inches new roots make their appearance, and before the roots become very far advanced any potting that may be necessary should be attended to. It is not desirable to annually repot provided a lasting material, as well as ample root space, are afforded.

HYBRID PHAIUS such as P. Cooksoni, P. Norman, P. Clive, P. Harold, P. Cooksoniæ, P. Phœbe, P. Oakwoodiensis, P. Chapmani, P. Doris, and others that have been derived from the intercrossing of the two Madagascar species, P. simulans (better known in gardens as P. tuberculosus), and P. Humbloti are a desirable class, and are exceedingly useful in gardens where plants in flower are required for house decorations during the months of March, April, and May. Although generally classed as stove plants, I consider they are better accommodated in an intermediate house temperature; at any rate as soon as the flowers are expanded they may be transferred to the conservatory or greenhouse, where the temperature is maintained about 50 deg. at night. Here they last for several weeks in perfection, and they may be also used without injury for house decoration, but care should be taken not to overwater while they are subjected to cool treatment. When well grown the finest hybrids are most useful for exhibition. They should also have repotting attended to as soon as the new roots make their appearance. The compost we find most suitable consists of equal portions of fibrous loam, peat, leaf-soil, and chopped sphagnum moss, with sufficient finely-broken crocks and silver sand to render the compost porous. If it is thought desirable a little dried cow manure may be intermixed, but it is now some years since we used anything of the kind in the potting compost. The size of pots must be governed not so much by the size of the plants as the amount of roots they have. Where the plants do well they are robust rooting, and require ample space. The pots should be carefully drained to about one-third their depth, and the compost should be made firm about the roots. Water as soon as repotting is completed, and shade carefully from excessively strong light.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.
